The differential equations describing the flap-lag-torsional motion of a flexible rotor blade including third-order nonlinearities were derived for hover and forward flight. Making use of the two boundary conditions, those equations were reduced to a set of three integro partial differential equations written in terms of the flexural deflections and the torsional variable. SUBSONIC BALANCE AND PRESSURE INVESTIGATION OF A 60-DEG DELTA WING WITH LEADING-EDGE DEVICES (DATA REPORT)
Dhanvada M. Rao and Stephen A. Tingas (North Carolina State Univ., Raleigh) Hampton, Va. NASA. Langley Research Center Nov. 1981 126 p refs
(Contract NAS1-16259)
(NASA-CR-165806) Avail: NTIS HC A07/MF A01 CSCL 01A

The drag reduction potential of leading edge devices on a 60 degree delta wing at high lift was examined. Geometric variations of fences, chordwise slots, pylon type vortex generators, leading edge vortex flaps, and sharp leading edge extensions were tested individually and in specific combinations to improve high-alpha drag performance with a minimum of low-alpha drag penalty. The force, moment, and surface static pressure data for angles of attack up to 23 degrees, at Mach and Reynolds numbers of 0.16 and 3.85 x 10 to the 6th power per meter are documented. E.A.K.

LOW-SPEED AERODYNAMIC PERFORMANCE OF A HIGH-ASPECT-RATIO SUPERCRITICAL-WING TRANSPORT MODEL EQUIPPED WITH FULL-SPAN SLAT AND PART-SPAN DOUBLE-SLOTTED FLAPS
Harry L. Morgan, Jr. and John W. Paulson, Jr. Dec. 1979 145 p refs
(NASA-TP-1580; L-13201) Avail: NTIS HC A07/MF A01 CSCL 01A

An investigation was conducted in the Langley V/STOL tunnel to determine the static longitudinal and lateral-directional aerodynamic characteristics of an advanced high-aspect-ratio supercritical-wing transport model equipped with a full-span leading-edge slat and part-span double-slotted trailing-edge flaps. This wide-body transport model was also equipped with spoiler and aileron control surfaces, flow-through nacelles, landing gear, movable horizontal tails, and interchangeable wing tips with aspect ratios of 10 and 12. The model was tested with leading-edge slat and trailing-edge flap combinations representative of cruise, climb, takeoff, and landing wing configurations. The tests were conducted at free-stream conditions corresponding to Reynolds numbers (based on mean geometric chord) of 0.97 to 1.63 x 10 to the 6th power and corresponding Mach numbers of 0.12 to 0.20, through an angle-of-attack range of -2 deg to 24 deg and a sideslip-angle range of -10 deg to 5 deg. STRUTS

Self-oscillations of the front caster wheel strut for a given track width under the assumption of the wheel drift hypothesis A82-16290

SUBSONIC AIRCRAFT

A mathematical model of a subsonic transport aircraft A82-18575

SUBSONIC FLOW

Subsonic flow over airborne optical turrets A82-17605

Optimal subsonic diffuser wall design for arbitrary entry conditions [AIAA PAPER 82-0132] A82-17800

Calibration of seven-hole probes suitable for high angles in subsonic compressible flows [AIAA PAPER 82-0410] A82-17931

Calculation of quasi-stationary aerodynamic force acting on a cascade of oscillating airfoils in subsonic flow N82-15051

Numerical experiments on unsteady flows through vibrating cascades N82-15052

SUBSONIC FLUTTER

Damping for turbomachine blade variations in subsonic flow N82-15048

SUBSONIC SPEED

Performance considerations in the design of subsonic cruise missiles [AIAA PAPER 82-0371] A82-17911

SUBSONIC WIND TUNNELS

Unsteady flow patterns associated with spoiler control devices [AIAA PAPER 82-0127] A82-17798

Subsonic balance and pressure investigation of a 60-deg delta wing with leading-edge devices (data report) [NASA-CR-165806] N82-15014

SUCTION

Vortex lift augmentation by suction on a 60 deg swept Gothic wing [AIAA PAPER 82-0231] A82-17856

Recent sidewall boundary-layer investigations with suction in the Langley 0.3-m Transonic Cryogenic Tunnel [AIAA PAPER 82-0234] A82-17858

A theoretical investigation of wing rocking [NASA-CR-165058] N82-15031

SUPERCRITICAL WINGS

Low-speed aerodynamic performance of a high-aspect-ratio supercritical-wing transport model equipped with full-span slat and part-span double-slotted flaps [NASA-TP-1580] N82-15015

Longitudinal and lateral static stability and control characteristics of a 1/6-scale model of a remotely piloted research vehicle with a supercritical wing [NASA-TP-1360] N82-15075

SUPERSONIC AIRCRAFT

V/STOL propulsion control technology [AIAA PAPER 81-2634] A82-16909

Optimal trajectories in supersonic flight [AIAA PAPER 82-0366] A82-17906

NASA Dryden Flight Loads Research Facility [NASA-TM-81368] N82-15079

SUPERSONIC FLIGHT

Optimal trajectories in supersonic flight [AIAA PAPER 82-0366] A82-17906

An aerodynamic and signature shaping technique for developing advanced supersonic missile concepts [AIAA PAPER 82-0373] A82-17912

SUPERSONIC FLOW

Pressure distribution on an ogee wing in supersonic flow [AIAA PAPER 82-0414] A82-17934

The effect of the cooling of the wing surface on laminar-to-turbulent boundary layer transition at supersonic flow velocities A82-18591

Experimental investigation of a transonic potential flow around a symmetric airfoil [NASA-TM-76676] N82-14057

A method of characteristics solution for a finite oscillating supersonic cascade with thickness effects N82-15060

SUPERSONIC FLUTTER

Aerodynamic considerations in the prediction of unstalled supersonic flutter in transonic fans N82-15058

Effect of mean blade loading on supersonic cascade flutter N82-15059

SUPERSONIC JET FLOW

Screech suppression in supersonic jets [AIAA PAPER 82-0050] A82-17753

SUPERSONIC NOZZLES

Supersonic nozzles without shocks A82-16172

SUPERSONIC SPEEDS

Recent improvements in prediction techniques for supersonic weapon separation [AIAA PAPER 82-0170] A82-17820

Evaluation of supersonic missile aerodynamic prediction techniques [AIAA PAPER 82-0390] A82-17920

SURFACE GEOMETRY

Effect of the blading type on the aerodynamic damping of blade vibrations with allowance for the profile curvature A82-18484

SURFACE NAVIGATION

PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record A82-18126

SURFACE ROUGHNESS

C-5A operational utility evaluation soil tests and analysis [AD-A105555] N82-14083

SURFACE WAVES

A global atlas of GEOS-3 significant waveheight data and comparison of the data with national buoy data [NASA-CR-156882] N82-15498

SWEPT FORWARD WINGS

Computational treatment of transonic canard-wing interactions [AIAA PAPER 82-0161] A82-17814

SWEPT WINGS

Vortex lift augmentation by suction on a 60 deg swept Gothic wing [AIAA PAPER 82-0231] A82-17856

SYNOPTIC METEOROLOGY

Mesoscale convective weather systems and aviation operations [AIAA PAPER 82-0015] A82-17733

SYSTEM EFFECTIVENESS

Coordinate transformation in PLRS --- algorithm and error analysis of Position Location and Reporting System A82-18158

On-board computer progress in development of A 310 flight testing program N82-14833

SYSTEM FAILURES

Description of a dual fail operational redundant strapdown inertial measurement unit for integrated avionics systems research N82-14842

SYSTEMS ENGINEERING
- MLS - A new generation landing guidance system is here A82-18145
- Advanced crash survivable flight data recorder and Accident Information Retrieval System (AIRS) [AD-A105510] N82-14072

- Relations for the thermodynamic and transport properties in the testing environment of the Langley hypersonic CF4 tunnel [NASA-TM-83220] N82-15359

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

operation from the test cell to on-wing is recognized as a highly economical procedure. A technique is required, however, whereby engines can be analyzed to the module level in a reliable and technically sound way. Gas Path Analysis (GPA) with multiple simultaneous fault isolation and the ability to deal with measurement noise, has been developed to meet that need. Major GPA activity as of mid-1980 is summarized, based on its use by eight airlines. Results show that GPA is a successful technique and can be used for on-wing engine monitoring to the module level for the new generation aircraft. J.F.

A82-17287 Energy conservation through airport design and management. H. I. F. Ouyang (Civil Aeronautics Administration, Taipei, Republic of China). In: Safe and efficient management of energy; Proceedings of the Thirty-third Annual International Air Safety Seminar, Christchurch, New Zealand, September 15-18, 1980. Arlington, VA, Flight Safety Foundation, Inc., 1980, p. 208-233.

Energy conservation principles through airport design and management are described and then compared with those applied at the Chiang Kai-Shek International Airport. The results of the comparison may be used at existing airports, where current systems and operation procedures can be evaluated, and where programs necessary to reduce energy consumption without affecting airport performance may be developed. The analysis should also be considered at the design stage of new airports, where the material specifications of an architectural structure and the technical requirements of mechanical and electrical systems with energy saving functions may be considered and reviewed in order that necessary modifications may be made as early as possible. J.F.

A82-17288 Handling problems associated with jet aircraft fuels. L. C. Quigg (Lockheed Air Terminal, Inc., Burbank, CA). In: Safe and efficient management of energy; Proceedings of the Thirty-third Annual International Air Safety Seminar, Christchurch, New Zealand, September 15-18, 1980. Arlington, VA, Flight Safety Foundation, Inc., 1980, p. 234-250. 18 refs.

A good quality control program is needed to eliminate the threat of dirty fuel, a problem that can adversely affect aircraft maintenance and safety. The contaminants that affect fuel cleanliness include particulate matter (rust, millscale, sand), water (dissolved and undissolved), surfactants (refinery carry-overs and fuel additives picked up in pipeline delivery systems), and microorganisms. If not effectively controlled or removed from the fuel, they can cause fuel tank corrosion, tank quantity gage inaccuracies, engine fuel control problems, and filter and screen blockage. An effective quality control program will eliminate these contaminants by (1) verifying the product; (2) detecting the presence and origin of contaminants; (3) effectively removing the contaminants; (4) providing well-designed facilities; and (5) establishing a reliable inspection program. J.F.

A82-17289 Computer flight planning for fuel efficiency. L. M. Reinkens (Lockheed Aircraft Service Co., Ontario, CA). In: Safe and efficient management of energy; Proceedings of the Thirty-third Annual International Air Safety Seminar, Christchurch, New Zealand, September 15-18, 1980. Arlington, VA, Flight Safety Foundation, Inc., 1980, p. 256-269.

The need to improve fuel efficiency is forcing the aviation industry to reassess the use of computer flight planning (CFP). In the past decade, CFP was based on mechanizing manual techniques; the demand now is for CFP to take technology one step further into (1) inexpensive on-line conversational systems available throughout the world; (2) refined optimization techniques in route and profile selection to minimize fuel uplift, maximize payload, and extend range; (3) reanalysis enroute to reflect take-off variations and minimize fuel consumption; (4) reanalysis in the event of diversion to an alternate; (5) remote data base entry; and (6) refined reserve fuel consumption. The proposed interactive system and conversational network are given; differences in cruise speeds, fuel, and payload requirements of the Boeing 737 and 747 are illustrated. J.F.

A82-17290 Liquid hydrogen - An outstanding alternate fuel for transport aircraft. W. M. Hawkins. In: Safe and efficient management of energy; Proceedings of the Thirty-third Annual International Air Safety Seminar, Christchurch, New Zealand, September 15-18, 1980. Arlington, VA, Flight Safety Foundation, Inc., 1980, p. 270-295.

Liquid hydrogen is proposed as an excellent alternate aircraft fuel, owing to its worldwide availability, low cost, ability to be transported and stored without difficulty, and minimum impact on the environment. NASA compared the characteristics and performance of three aircraft using (1) synthetic Jet A, (2) liquid methane, and (3) liquid hydrogen. The liquid hydrogen aircraft was found to weigh considerably less than the others, thereby reducing the take-off gross weight. Every pound of hydrogen produces 51,590 BTU's, whereas a pound of Jet A produces only 18,400 BTU's. Moreover the liquid hydrogen aircraft uses the least energy in spite of aerodynamic disadvantages of the aircraft and high energy needs for liquefaction and the manufacturing process. Liquid hydrogen also has a fly-over noise level of 89 decibels compared to the 94 decibels for the Synjet aircraft. A simple system of laminar flow maintenance using liquid hydrogen is discussed, and several safety features of the fuel are noted. J.F.

A82-17310 # NAVSTAR Global Positioning System. J. H. Martel (USAF, Washington, DC). In: Space tracking and data systems; Proceedings of the Symposium, Arlington, VA, June 16-18, 1981. New York, American Institute of Aeronautics and Astronautics, 1981, p. 89-93.

The NAVSTAR Global Positioning System (GPS) is an important new space-based radio navigation system currently under development by the Department of Defense. The system will provide highly accurate three-dimensional position, velocity, and time information to an unlimited number of suitably equipped users anywhere on or near the earth. The system will consist of three segments: the Satellite or Space Segments, the Control Segment, and the User Segment. All three segments are currently in full scale development leading to a full three-dimensional world-wide capability by late 1987. Potential military applications of the system are virtually limitless. Potential civil applications, while currently less well defined than military uses, are also extensive. Testing of early development models have clearly demonstrated that the system has the potential to perform up to near theoretical expectations. Early problems with spacecraft atomic clocks appear to have been solved and the program is progressing on a sound technical basis. The remaining challenge is to achieve an optimum balance to assure that sufficient accuracy is available to satisfy valid civil needs without jeopardizing national security objectives. (Author)

A82-17417 Development of the Lockheed SR-71 Blackbird. C. L. Johnson. *Lockheed Horizons*, Winter 1981-1982, p. 2-7, 13-18.

An account is given of the development history of the SR-71 reconnaissance aircraft, with attention to the use of novel design concepts in high-temperature materials and their fabrication and the aerodynamics required for efficient flight at cruise speeds of Mach 3.0. Consideration is also given to the parallel development of the YF-12A, air defense long-range fighter derivative. Emphasis is placed on the integration of the J58 engine into the SR-71's nacelles, whose inlets, air bleed mechanisms and ejector underwent the greatest portion of wind tunnel testing time for optimization. Age B-120 titanium alloy was chosen as the main structural material, in the form of machined forgings and corrugated skins which resist high-temperature warping. With refueling, the special cockpit and lubrication cooling systems developed allow continuous flights of 15,000 miles. Aircraft of this type have exceeded Mach 3.0 over 11,000 times since becoming operational in 1964. O.C.

A82-17418 J58/SR-71 propulsion integration or the great adventure into the technical unknown. W. H. Brown. *Lockheed Horizons*, Winter 1981-1982, p. 7-13.

The integration of the J58 engine into the SR-71 nacelles is detailed, with attention to the accommodation of such consequences of Mach 3.0 cruise speeds as (1) engine inlet air temperatures exceeding 800 F, (2) fuel inlet temperatures of 350 F, (3) fuel temperatures ranging from 600 to 700 F at the main and afterburner nozzles, and (4) lubricant temperatures of 700-1000 F in localized parts of the engine. A new fuel and a chemical lubricant were developed to meet temperature requirements. Consideration is given to the mounting of the engine, and the air flow patterns induced in the nacelle through the actuation of bypass and suck-in doors, centerbody bleed, and external ejector flaps. Special efforts were made in the solution of engine inlet unstart problems. Testing facilities and development program management are also considered. O.C.

A82-17419 **Modern aircraft accident investigation equipment and techniques.** E. J. Rosenbauer, Sr. (Lockheed Aircraft Service Co., Ontario, CA). *Lockheed Horizons,* Winter 1981-1982, p. 20-27.

A description is given of the design features and operational capabilities of the Model 109 Flight Data Recorder (FDR) and Model 209 Digital Flight Data Recorder (DFDR), with emphasis on the superior survivability standards addressed by the Model 209. The DFDR has operated properly when subjected to (1) vibrations of 5-500 Hz, at 0.036-inch double amplitude and 10 G acceleration, in 15-min cycles for a period of 1 hr in each axis; (2) impact shocks having a peak acceleration magnitude of 1000 G and 5 msec duration; and (3) flames of 1100 C over 50% of the external surface for 30 min. In addition, the data on the DFDR's recording medium remained intact after 24 hours of immersion in aircraft fuel, lubricating oil, and fire extinguishing fluids, and reproducible after 36 hours of immersion in seawater. Post-accident recorder handling and data recovery procedures are also covered. O.C.

A82-17420 **The all-electric airplane - A new trend.** M. J. Cronin (Lockheed-California Co., Burbank, CA). *Lockheed Horizons,* Winter 1981-1982, p. 28-39.

After a brief, historical consideration of the progress of aeronautics and of the feasibility of electrical-propulsion aircraft such as the photovoltaic Solar Challenger, a description is given of the direct operating cost reductions and system efficiencies derived from the replacement of bleed air/hydraulic/pneumatic/electrical aircraft power systems by a single, electric power system. In such a system, electric generators are the sole source of power for such functions as (1) the primary/secondary flight control system; (2) de-icing and anti-icing; (3) environmental controls; (4) electronics and avionics loads; and (5) landing gear actuation and other mechanical functions. Estimates are presented of cycled weight savings and of the power extraction penalties that may be obviated by the all-electric system. The integration of power-by-wire and fly-by-wire systems is also discussed. O.C.

A82-17531 **Tensile fatigue assessment of candidate resins for use in fibre reinforced composite repair schemes.** D. P. Bashford, A. K. Green (Fulmer Research Institute, Ltd., Stoke Poges, Bucks., England), K. F. Rogers, and D. M. Kingston-Lee (Royal Aircraft Establishment, Materials Dept., Farnborough, Hants., England). In: Composite structures; Proceedings of the First International Conference, Paisley, Scotland, September 16-18, 1981.
London, Applied Science Publishers, 1981, p. 556-572. Research supported by the Ministry of Defence (Procurement Executive).

Five matrix resin systems have been evaluated as potential candidates for use in a rapid repair system for aircraft skin damage, incorporating glass/carbon fiber hybrid reinforced plastics as the repair material. Two epoxy and three polyester resin systems were evaluated at 20 C. Additionally, the three polyester systems were evaluated at 0 C. The effect of contamination of metal surfaces by aviation fuel and hydraulic fluid was investigated. The properties measured were metal/composite joint overlap shear strength, as manufactured and following a fixed schedule of tensile fatigue load conditioning, and bending stiffness. These properties were determined 4 h and 24 h after fabricating the simulated repair. The resin system Quickcure QC3/Lucidol CH50/dimethyl-p-toluidine was found to give repairs equal to riveted metal plate repairs under all circumstances except to hydraulic fluid contaminated substrates at 0 C. (Author)

A82-17535 **Stress intensity factor measurements in composite sandwich structures.** I. Roman, H. Harel, and G. Marom (Jerusalem, Hebrew University, Jerusalem, Israel). In: Composite structures; Proceedings of the First International Conference, Paisley, Scotland, September 16-18, 1981. London, Applied Science Publishers, 1981, p. 633-646. 8 refs.

It is pointed out that although LEFM and its fracture criterion - the critical stress intensity factor - have been used in research with composites for quite some time, its applicability is not yet commonly accepted. The study described here seeks to provide an experimental certification of the applicability of the concept to a composite control surface. The structure used is constructed of angle-ply composite skins and a composite honeycomb core. The research is confined to cases of skin damage, such as surface scratches or notches, and seeks to provide a tool for determining when such forms of detectable damage become critical. It is noted that in many cases the fracture process in sandwich structures containing skin surface notches is confined to delamination in the skin at the vicinity of the notch tip; this is ultimately followed by splitting at the adhesive layer between the skin and the core. In such cases, it is possible to calculate the fracture stress of the sandwich structure from the fracture toughness of the skin. The relevant Y value is the one obtained from the new Y polynomials derived for the skin and from the corresponding ratio of notch depth to skin thickness. C.R.

A82-17538 **Effects of elastomeric additives on the mechanical properties of epoxy resin and composite systems.** R. J. Moulton (Hexcel Corp., Dublin, CA) and R. Y. Ting (U.S. Navy, Naval Research Laboratory, Orlando, FL). In: Composite structures; Proceedings of the First International Conference, Paisley, Scotland, September 16-18, 1981. London, Applied Science Publishers, 1981, p. 674-688. 16 refs.

Both the fracture behavior and the mechanical properties balance of fiber-reinforced composites containing a modified resin system are discussed on the basis of the results of an extensive experimental study. A series of acrylonitrile-butadiene modified epoxy polymers is used. Resin fracture energies are determined by using standard compact tension specimens and the Izod impact specimens. The elastomeric modifiers greatly increase the fracture energy of the base epoxy, and the extent of this increase is found to depend on the weight percentage and the molecular weight of the CTBN additives. In addition, post-failure fractography is also carried out to examine the system morphology for the identification of the basic mechanism of toughening. Enhanced toughness is always found to couple with trade-offs in strength and modulus. The results also show that the short beam shear test gives the interlaminar shear strength of the composite sample but not the interlaminar fracture energy. C.R.

A82-17594 * # **Multilevel optimum design of structures with fiber-composite stiffened-panel components.** L. A. Schmit and M. Mehrinfar (California, University, Los Angeles, CA). *(AIAA, ASME, ASCE, and AHS, Structures, Structural Dynamics and Materials Conference, 21st, Seattle, WA, May 12-14, 1980, AIAA Paper 80-0723.) AIAA Journal,* vol. 20, Jan. 1982, p. 138-147. 14 refs. Grant No. NsG-1490.

The multilevel approach to minimum weight structural design is extended to wing box structures with fiber-composite stiffened-panel components. Strength, deflection, and panel buckling constraints are treated at the system level with equivalent-thickness-type design variables. Local buckling and panel buckling constraints are guarded against at the component level, employing detailed component dimensions as design variables. A key feature of the method is selection of change in stiffness as the component level objective function to be minimized. Numerical results are given for wing box structures with sandwich and hat-stiffened fiber-composite panels. (Author)

A82-17962 # **Effect on surface pressure of trapezoidal holes in a T-38 stabilator.** J. C. Westkaemper and R. M. Chandrasekharan (Texas, University, Austin, TX). *Journal of Aircraft,* vol. 19, Jan. 1982, p. 81, 82. USAF-sponsored research.

Subsonic wind tunnel measurements were made of the surface pressure distributions on a T-38 stabilator with four configurations of trapezoidal holes, in a study of the effects of damage on wing and tail aeroelastic characteristics. The effects of the holes on surface pressures were found to follow two patterns, one for attached flow and another for separated flow, depending on the extent of leading-edge separation on the stabilator. At angles of attack of more than 5 deg, with separation, all upper surface pressures were perturbed. O.C.

A82-17963 * # **Propeller tip vortex - A possible contribution to aircraft cabin noise.** B. A. Miller, J. H. Dittmar, and R. J. Jeracki (NASA, Lewis Research Center, Cleveland, OH). *Journal of Aircraft,* vol. 19, Jan. 1982, p. 84-86. 8 refs.

fan bypass ratios, the noise components contributed by nacelles, slats, and flaps at various angles, and the specialized options offered by the modular-structure program. O.C.

A82-18321 **A short history of aviation gasoline development, 1903-1980.** A. R. Ogston. *(Society of Automotive Engineers, West Coast International Meeting, Seattle, WA, Aug. 3-6, 1981.) Aeronautical Journal,* vol. 85, Dec. 1981, p. 441-450. 9 refs.

An historical account is given of the development of gasoline for aircraft engines, in keeping with advances in reciprocating engine design and increasing performance requirements. Consideration is given to the capabilities of the oil refining industry at the time of the Wright brother's first powered flight in 1903, and the dependence between engine performance and fuel chemistry established shortly thereafter by the Wrights and other aviation pioneers. The cracking process, yielding gasolines with superior anti-knock properties, was not invented until 1913, and no official specifications for aviation gasoline existed before the First World War. The first systematic studies of the relation of detonation to fuel quality were made by Harry Ricardo in 1919, using a single-cylinder, variable-compression engine, and the first truly adequate, 100 octane gasolines became available in 1935. The 30% horsepower increase resulting from 100 octane gasoline's use was an essential element of the RAF's victory over the Luftwaffe in the Battle of Britain. The introduction of turboprop and turbojet airliners during the 1950s brought an end to the development of aviation gasoline. O.C.

A82-18322 **Design evolution of the Boeing 757.** P. M. Condit (Boeing Commercial Airplane Co., Renton, WA). *Aeronautical Journal,* vol. 85, Dec. 1981, p. 451-458.

An account is given of the development history of the 757-200 airliner, which is scheduled to enter service in January 1983. Attention is given the degree of structural commonality with the 727 aircraft that the 757 replaces, and the advanced flight management and hydraulic and electrical power systems shared by the 757 and wide-body 767 designs. The 757-200 may be fitted with 25-32% more seats than the 727, and incorporates RB211 engines whose specific fuel consumption is 26-31% lower than those used in the 727-300B program. The all-digital, two-pilot flight deck of the 757 provides flight path/energy management computation and display capabilities unavailable in current airliners, and can in addition display weather radar and optimum climb profiles and cruise altitudes. The energy efficiency gains estimated for the digital avionics are as high as 6%. O.C.

A82-18346 **F101DFE in Tomcat - Preliminary test results.** M. Gaines. *Flight International,* vol. 120, Dec. 19, 1981, p. 1826-1828.

System features and performance of the F101DFE engines in the F-14 Tomcat fighter are described. The two 29,000 lb thrust engines have a bypass ratio of 0.85, the core of the F101, and a scaled-up front end and nozzle from the F404 like in the F-18 Hornet. The engine components are detailed, and it is noted that the F101DFE can cross-start at ground idle. The new engines give a 62% combat radius increase, 34% longer patrol on-station, and 22% more energy for maneuvering. The Super Tomcat can climb at Mach 0.8, 30 deg pitch, with 8,000 lb of fuel and have power left at 40,000 ft, having taken off without afterburners from a carrier deck. The fuel is burned smokelessly, and combat maneuvering tests with F-5s showed that the F-5 pilots were unable to achieve either a gun or missile fix on the F101DFE aircraft, although a reticence to use full dual throttle capability was noted during test pilots' first flights. M.S.K.

A82-18347 **2037 - Pratt & Whitney tests new turbofan.** J. Moxon. *Flight International,* vol. 120, Dec. 19, 1981, p. 1832-1834.

The PW2037 turbofan, earmarked for use on the Boeing 757, is discussed. The engine provides 37,000 lb of thrust, spins 30% faster than the JT9D, and employs powdered metal nickel alloy discs. Other features are a 30:1 pressure ratio, single crystal blades, an inlet temperature of 1385 C, an electron beam welded drum, and digital engine control. Dual redundancy and three levels of self-test and fault isolation are included in the electronics, and active clearance control, abradable tip seals, and increased stiffness and concentricity result in a 2% added fuel efficiency. Flight testing aboard a 747 is scheduled for February 1983, with actual delivery for use on the 757 to begin in 1984. M.S.K.

A82-18348 **Lear Fan - The plastic aeroplane arrives.** R. Whitaker. *Flight International,* vol. 120, Dec. 26, 1981, p. 1896-1901.

The carbon reinforced plastic Lear rear-mounted turboprop aircraft is discussed. The design includes a 15,000 hr/15,000 cycle life, and high-strength areas where aluminum was used are indicated. The Kevlar radome is built to withstand a 4-lb birdstrike at 250 knots airspeed. The airfoils are computer optimized from the NACA 65 series and have Nomex honeycomb cores. A weight of 7200 lb and a wing area of 163 sq ft are mentioned for the Y-tailed plane. Centerline thrust is provided by independent dual engines, which are monitored by a metal chip detector to expand the operating safety margin. The engines have 850 shp and the cruise speed is 311 kt at 40,000 ft. It is noted that the propeller can operate at high Mach speeds and is also made of composites. Full certification is projected for 1983 with the addition of deicers. M.S.K.

A82-18349 **Boeing 757 - Introducing the big-fan narrowbody.** D. Velupillai and F. Munger. *Flight International,* vol. 121, Jan. 2, 1982, p. 12-20.

The Boeing 757, a 180 passenger turbofan powered aircraft intended for short haul airliner service, is described. Intended as a replacement for the 727, the 757 has a narrow-bodied fuselage with seating arranged six abreast, and offers fuel savings of 20% over previous turbofans. Many systems are interchangeable with the 767, and a cruise speed of Mach 0.8 is given for the 155 ft 3 in. long aircraft. Components of the body made of composites and advanced aluminum alloys have achieved significant weight savings and improved strength, in addition to increased range. The plane has a design range of 500 n.m. Emergency equipment is designed to operate automatically for the most part, and it is noted that the cockpit, with CRT displays, is the same cockpit used for the 767. M.S.K.

A82-18412 **Consideration of mechanical, physical, and chemical properties in bearing selection for landing gear of large transport aircraft.** H. E. Fewtrell (Lockheed-California Co., Burbank, CA). *American Society of Lubrication Engineers and American Society of Mechanical Engineers, Lubrication Conference, New Orleans, LA, Oct. 5-7, 1981, ASLE Preprint 81-LC-2B-3.* 4 p. Members, $2.00; nonmembers, $4.00.

A comparison of the performance of aluminum nickel bronze and beryllium copper under test and service conditions demonstrates that mechanical, physical and chemical properties must all be considered in the selection of bearing materials. These properties are related to specific performance requirements for the cases of (1) pin joints lubricated with diester grease and (2) shock strut pistons lubricated with MIL 5606 hydraulic oil, to show that the greater thermal diffusivity of beryllium copper can effectively prevent hot spotting under marginal lubrication conditions. In addition, data are presented which demonstrate how the chemical reactivity of beryllium copper, in the presence of the tricresyle phosphate of MIL 5606 hydraulic oil, can preclude the generation of ladder cracks in large transport landing gear pistons with chrome plating. O.C.

A82-18429 # **Four pad tilting pad bearing design and application for multistage axial compressors.** J. C. Nicholas and R. G. Kirk (Ingersoll-Rand Co., Turbo Machinery Div., Phillipsburg, NJ). *American Society of Mechanical Engineers and American Society of Lubrication Engineers, Joint Lubrication Conference, New Orleans, LA, Oct. 5-7, 1981, ASME Paper 81-Lub-12.* 7 p. 17 refs. Members, $2.00; nonmembers, $4.00.

Advantages of operating multistage axial compressors on 4 pad tilting pad bearings are discussed and compared to other fixed bore and tilting pad bearing designs. Advantages include operation free of subsynchronous vibrations, and placement of peak response speeds outside of the operating speed range with between pilot loading. Three axial groove and step journal bearings have asymmetric stiffness and damping properties, and therefore produce a split or double first critical speed. An axial compressor operating on three axial groove bearings may be subject to oil whirl and/or aerodynamic induced stabilities. Test results are in good agreement with theoretical analyses, and for the cases presented, the 4 pad tilting pad bearing is successful in removing the peak response from the operating speed range. D.L.G.

A82-18435 * # **Effects of ultra-clean and centrifugal filtration on rolling-element bearing life.** S. H. Loewenthal (NASA, Lewis Research Center, Cleveland, OH), D. W. Moyer (Tribon Bearing Co., Cleveland, OH), and W. M. Needelman (Pall Corp., Glen Cove, NY). *American Society of Mechanical Engineers and American Society of Lubrication Engineers, Joint Lubrication Conference, New Orleans, LA, Oct. 5-7, 1981, ASME Paper 81-Lub-35.* 9 p. 20 refs. Members, $2.00; nonmembers, $4.00.

Fatigue tests were conducted on groups of 65-mm bore diameter deep-groove ball bearings in a MIL-L-23699 lubricant under two levels of filtration to determine the upper limit in bearing life under the strictest possible lubricant cleanliness conditions. Bearing fatigue lives, surface distress and weight loss were compared to previous bearing fatigue tests in contaminated and noncontaminated oil filters having absolute removal ratings of 3, 30, 49, and 105 microns, with lubricant and sump temperatures maintained at 347 K. Ultra clean lubrication was found to produce bearing fatigue lives that were approximately twice that obtained in previous tests with contaminated oil using 3 micron absolute filtration. It was also observed that the centrifugal oil filter has the same effectiveness as a 30 micron absolute filter in preventing surface damage. D.L.G.

A82-18444 # **Inclusions and service induced cracks in a mature population of gas turbine engine bearings.** J. R. Barton, F. N. Kusenberger, and B. B. Baber (Southwest Research Institute, San Antonio, TX). *American Society of Mechanical Engineers and American Society of Lubrication Engineers, Joint Lubrication Conference, New Orleans, LA, Oct. 5-7, 1981, ASME Paper 81-Lub-48.* 9 p. 34 refs. Members, $2.00; nonmembers, $4.00. Contract No. F09603-74-C-5158.

The automated bearing inspection system called Critical Inspection of Bearings for Life Extension (CIBLE) was used to process NDE data acquired on approximately 1000 main shaft bearings used in the J57/TF33 gas turbine engine. Bearing service ranged from zero to about 13,000 hours, and both inclusions and service-induced cracks had been detected in a number of their components. In light of endurance testing that was conducted in addition to the metallurgical sectioning and scanning electron microscope investigations used in correlation analyses, a linear extrapolation of the total service population of the number 2 bearing position of the engine leads to the forecast of over 200 cracked bearings in the fleet of B52, KC135, C141, and E3A aircraft in which the J57/TF33 is installed. O.C.

A82-18452 # **Design and testing of a new double labyrinth seal.** J. S. Wyler (General Electric Co., Aircraft Instruments Dept., Wilmington, MA). *American Society of Mechanical Engineers and American Society of Lubrication Engineers, Joint Lubrication Conference, New Orleans, LA, Oct. 5-7, 1981, ASME Paper 81-Lub-58.* 6 p. 10 refs. Members, $2.00; nonmembers, $4.00.

A labyrinth seal that increases the fluid loss or fluid resistance through the leakage gap is presented. The design includes an inner member which can be slid axially into the outer member without interference. Losses are generated by the double labyrinth effect, and an analysis of loss measurement parameters is provided. Testing with a weight stand with JP4 jet fuel is described for the pressure drop across the seal. The results are noted to eliminate certain labyrinth designs from consideration for seal designs in a laminar region. The double labyrinth seal is, however, judged to be more effective than an equivalent annulus, although further tests on rotation are needed. Application of the results for improvements in the accuracy of fluid drive type angular momentum flowmeters are indicated. M.S.K.

A82-18479 † **Damage of turbine blades due to interaction with fuel resinification products (Razrushenie rabochikh lopatok turbiny v usloviiakh vzaimodeistviia s produktami osmoleniia topliva).** G. P. Pimenova, O. I. Marueli, I. A. Makovetskaia, and B. A. Griaznov (Akademiia Nauk Ukrainskoi SSR, Institut Problem Prochnosti, Kiev, Ukrainian SSR). *Problemy Prochnosti,* Dec. 1981, p. 27-32. 5 refs. In Russian.

The sulfide corrosion damage of the rotor blades of aircraft and stationary gas turbine engines have been studied after actual operation. Conditions leading to the formation of a corrosion layer containing films of nickel-nickel sulfide eutectics (35% S and 65% Ni) on ZhS6kp and EI826 alloy blading are identified. It is shown that such a layer reduces the fatigue strength of the blades by 60%. V.L.

A82-18484 † **Effect of the blading type on the aerodynamic damping of blade vibrations with allowance for the profile curvature (K voprosu o vliianii tipa reshetki na aerodinamicheskoe dempfirovanie kolebanii lopatok s uchetom krivizny profilei).** N. Iu. Nesterko (Akademiia Nauk SSSR, Institut Problem Prochnosti, Kiev, Ukrainian SSR). *Problemy Prochnosti,* Dec. 1981, p. 68-70. 7 refs. In Russian.

The aerodynamic damping of blade vibrations has been studied experimentally as a function of the blading type, blade stagger angle, and blade curvature. It is shown that the effect of the adjacent blades on one another depends on the blading type and blade curvature. Experimental results are found to be in good qualitative agreement with the known theoretical studies; the quantitative deviation does not exceed 30-40%. V.L.

A82-18576 † **A mathematical model of a subsonic transport aircraft (O matematicheskoi modeli dozvukovogo transportnogo samoleta).** A. F. Latypov and B. N. Soroka (Akademiia Nauk SSSR, Institut Teoreticheskoi i Prikladnoi Mekhaniki, Novosibirsk, USSR). *Akademiia Nauk SSSR, Sibirskoe Otdelenie, Izvestiia, Seriia Tekhnicheskikh Nauk,* Oct. 1981, p. 83-88. In Russian.

A mathematical model of a subsonic turbojet-engine transport aircraft is developed which is based on the representation of the aerodynamic polar curve and the engine throttling characteristic in the form of generalized relationships. Also included are the necessary conditions for maximum flight range. Dimensionless parameters are incorporated into the model which reflect the characteristics of the airframe and power plant and make it possible to vary the optimum lift-drag ratio of the airframe and the thermodynamic efficiency of the power plant within wide limits. Examples are included of calculations carried out to determine the optimum dimensions of the power plant and to assess the effect of the dimensionless parameters on the aircraft's characteristics. C.R.

A82-18583 † **Determination of the trimmed drag of an aircraft (Opredelenie balansirovochnogo aerodinamicheskogo soprotivleniia samoleta).** V. A. Barinov and A. G. Obrubov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 1, 1981, p. 78-84. 5 refs. In Russian.

It is shown that rake angles of flow from the wing near the horizontal tail surface calculated by the Glauert method agree well with experimentally measured angles. Formulas for calculating the drag of the horizontal tail surface are presented. An analysis is presented of the influence of the longitudinal static stability margin and longitudinal moment coefficient (at zero lift) on the lift-drag ratio under trim conditions. B.J.

A82-18584 † **Game-theoretical method for the synthesis of aircraft control during landing approach (Igrovoi podkhod k zadache sinteza upravleniia samoletom pri zakhode na posadku).** I. N. Titovskii. *TsAGI, Uchenye Zapiski,* vol. 12, no. 1, 1981, p. 85-92. In Russian.

The theory of differential games is used to consider the control of a nonmaneuvering aircraft in a longitudinal channel on a glide descent path under wind disturbances. An optimal control algorithm is obtained that ensures minimum deviation of the aircraft from glide, with allowance for constraints on the speed of control-surface reversal. Numerical results are presented. B.J.

A82-18586 † **Investigation of the stress-strain state of a rectangular wing section of variable thickness under concentrated loads and heating (Issledovanie napriazhenno-deformirovannogo priamougol'nogo kessona peremennoi tolshchiny pri sosredotochennykh nagruzkakh i nagreve).** S. N. Bulatov and P. N. Kurochka. *TsAGI, Uchenye Zapiski,* vol. 12, no. 1, 1981, p. 121-128. In Russian.

The Lagrange principle of virtual displacements is used to obtain a system of differential equations with variable coefficients. The solution of this system is used to determine the displacements of the arbitrary cross-section contour of a rectangular wing section under concentrated loads and an inhomogeneous temperature field. Displacements of contour points caused by warping are determined from the inhomogeneous Bessel equations. Computational results are presented. B.J.

A82-18589 † **Concerning the calculation of the aerodynamic characteristics of mechanized wings (K raschetu aerodinamicheskikh kharakteristik mekhanizirovannykh kryl'ev).** V. S. Savin. *TsAGI, Uchenye Zapiski,* vol. 12, no. 1, 1981, p. 129-133. In Russian.

analysis techniques to the design of high lift sections for flight conditions were determined and two high lift sections were designed to flight conditions. The influence of the high lift section on the sizing and economics of a specific energy efficient transport (EET) was clarified using a computerized sizing technique and an existing advanced airplane design data base. The impact of the best design resulting from the design applications studies on EET sizing and economics were evaluated. Flap technology trade studies, climb and descent studies, and augmented stability studies are included along with a description of the baseline high lift system geometry, a calculation of lift and pitching moment when separation is present, and an inverse boundary layer technique for pressure distribution synthesis and optimization. DETECTION OF OBSTACLES BY LOW FLYING AIRCRAFT
Dietmar Letalick Aug. 1981 42 p refs
(FOA-C-30227-E1) Avail: NTIS HC A03/MF A01

A model which calculates reflection from cylindrical obstacle surfaces, e.g., power cables is presented. Measurements of reflection of 10.6 micron radiation from various types of wires, cables and framework are reported. The measurements were performed in the laboratory using a CO2 laser and direct detection, with the targets a few meters away. Detection at distances of 500 and 1100 m using a coherent laser was also performed. Calculations of detection range for typical situations indicate that detection at km distances is possible. (NASA-TM-73296) Avail: NTIS HC A09/MF A01 CSCL 17G

An Automated Pilot Advisory System (APAS) was developed and operationally tested to demonstrate the concept that low cost automated systems can provide air traffic and aviation weather advisory information at high density uncontrolled airports. The system was designed to enhance the see and be seen rule of flight, and pilots who used the system preferred it over the self announcement system presently used at uncontrolled airports. S.L.

N82-15028# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick (West Germany). Abt. Flugzeugsteuerung und -regelung.
ANALYSIS OF TWO AIR TRAFFIC SAMPLES IN THE TERMINAL AREA OF FRANKFURT AM MAIN, 3 AUGUST 1979
Manfred Schubert and Uwe Voelckers Jun. 1981 119 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-740)
(DFVLR-Mitt-81-17; ESA-TT-740) Avail: NTIS HC A06/MF A01; DFVLR, Cologne DM 26,50

The random deviation of air traffic arrivals in the terminal area, the different structure of standard arrival routes and a multitude of operational procedures affect the overall planning of arrival traffic. The necessary time-balance between arrivals can be established partly by coordination between approach control and enroute controller and by flight path planning within the terminal area. The effect of the applied control procedures on arrival distributions, traffic handling, traffic sequence, and traffic density in the terminal area are analyzed for the recorded air traffic periods on August 3rd, 1979. The findings are discussed in comparison with the results of a proceeding analysis of approach traffic on August 4th, 1978. Author

HELICOPTER LANDING GEAR DESIGN AND TEST CRITERIA INVESTIGATION Final Report
David Crist and L. H. Symes Aug. 1981 192 p refs
(Contract DAAK51-79-C-0011; DA Proj. 1L1-62209-AH-76)
(AD-A105512; BHT-699-099-026; USAAVRADCOM-TR-81-D-15) Avail: NTIS HC A09/MF A01 CSCL 01/3

This program was an investigation of the criteria relating to helicopter landing gears. A computerized literature search was conducted and a bibliography is included in this report. Existing criteria were reviewed and conflicts were identified. An analysis of survivable Army helicopter accidents was performed. The results were used to formulate a tentative criterion. A design study was conducted to evaluate the practicality of the tentative criteria. This investigation compared wheel and skid-type landing gears designed to the tentative criteria and to MIL-S-8698. A crashworthiness analysis of the tentative criteria tailwheel tricycle gear was performed. Weights and landing loads were calculated. A cost comparison was made between tailwheel tricycle gears designed to the two criteria. The gear designed to the new criteria was cost-effective. The results of the investigation were used to modify the tentative criteria and recommendations were made for a new helicopter landing gear military specification and for changes to the existing criteria. ESTIMATION METHODS FOR THE DETERMINATION OF DYNAMIC RESPONSES OF ELASTIC AIRCRAFT
S. Vogel Bonn Bundesministerium der Verteidigung 1981 123 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-81-6) Avail: NTIS HC A06/MF A01; DOKZENTBw, Bonn DM 40

A method for establishing the dynamic response of an elastic aircraft structure to external excitation, such as random gusts or arbitrarily timed maneuver loads is presented. The solution is based on an analytic representation of the admittance functions by partial fractions. The time response frequency dependence of the aerodynamic forces induced by motion are approximated to allow analytical solutions which are shown to be as accurate, but more economical, than more elaborate numerical Fourier methods. Elasticity is introduced through eigenfrequencies and generalized masses. Several examples are shown which also include the influence of control systems and of elasticity on loads and accelerations. Depending on the quality of the structural and aerodynamical input, the method may be used as an estimation method or as an inexpensive approximation method for all dynamic problems in which elasticity, control systems and excitation time lag effects play a role. INTEGRATION OF A DIGITAL AIR DATA COMPUTER INTO THE TEST AIRCRAFT HFB-320
Rainer Dombrowsky and Vollmar Adam May 1981 62 p refs In GERMAN; ENGLISH summary
(DFVLR-Mitt-81-09) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 16

The digital air data computer HG 280 D5 is presented with its essential characteristics, output signals, and failure test facilities. Integration with the measuring equipment of the test aircraft HFB 320 as well as the hard and software developed for the signal interface of the onboard computer are described. The system processes flight data, such as rate of climb and descent, and altitude. Author (ESA)

COMPUTER PROGRAM FOR AERODYNAMIC AND BLADING DESIGN OF MULTISTAGE AXIAL-FLOW COMPRESSORS
James E. Crouse and William T. Gorrell Dec. 1981 106 p refs Prepared in cooperation with Army Aviation Research and Development Command, St. Louis, Mo.
(NASA-TP-1946; AVRADCOM-TR-80-C-21; E-280) Avail: NTIS HC A06/MF A01 CSCL 21E

A code for computing the aerodynamic design of a multistage axial-flow compressor and, if desired, the associated blading geometry input for internal flow analysis codes is presented. Compressible flow, which is assumed to be steady and axisymmetric, is the basis for a two-dimensional solution in the meridional plane with viscous effects modeled by pressure loss coefficients and boundary layer blockage. The radial equation of motion and the continuity equation are solved with the streamline curvature method on calculation stations outside the blade rows. The annulus profile, mass flow, pressure ratio, and rotative speed are input. A number of other input parameters specify and control the blade row aerodynamics and geometry. In particular, blade element centerlines and thicknesses can be specified with fourth degree polynomials for two segments. The output includes a detailed aerodynamic solution and, if desired, blading coordinates that can be used for internal flow analysis codes. Author

EFFECT OF FUEL INJECTOR TYPE ON PERFORMANCE AND EMISSIONS OF REVERSE-FLOW COMBUSTOR
Carl T. Norgren and Stephen M. Riddlebaugh Dec. 1981 40 p refs
(NASA-TP-1945; E-558) Avail: NTIS HC A03/MF A01 CSCL 21E

The combustion process in a reverse-flow combustor suitable for a small gas turbine engine was investigated to evaluate the effect of fuel injector type on performance and emissions. Fuel injector configurations using pressure-atomizing, spill-flow, air blast, and air-assist techniques were compared and evaluated on the basis of performance obtained in a full-scale experimental combustor operated at inlet conditions corresponding to takeoff, cruise, low power, and idle and typical of a 16:1-pressure-ratio turbine engine. Major differences in combustor performance and

[AIAA PAPER 81-2628] A82-16902

L

L-1011 AIRCRAFT

Digital active control system for load alleviation for the Lockheed L-1011
A82-16107

Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15576

LABYRINTH SEALS

Design and testing of a new double labyrinth seal
[ASME PAPER 81-LUB-58] A82-18052

LAMINAR BOUNDARY LAYER

The effect of the cooling of the wing surface on laminar-to-turbulent boundary layer transition at supersonic flow velocities
A82-18501

LAMINAR FLOW

A simple finite difference procedure for the vortex controlled diffuser
[AIAA PAPER 82-0109] A82-17788

THICKNESS
Gas turbine ceramic-coated-vane concept with convection-cooled porous metal core
[NASA-TP-1942] N82-14090
A method of characteristics solution for a finite oscillating supersonic cascade with thickness effects
N82-15060
THIN WINGS
Symmetric flow characteristics of thin rectangular wings
A82-16093
Concerning the calculation of the aerodynamic characteristics of mechanized wings
A82-18589
THREE DIMENSIONAL BOUNDARY LAYER
Transonic three-dimension viscous-inviscid interaction for wing-body configuration analysis
[AIAA PAPER 82-0163] A82-17816
THREE DIMENSIONAL FLOW
Supersonic nozzles without shocks
A82-16172
Three-dimensional flow studies on a slotted transonic wind tunnel wall
[AIAA PAPER 82-0230] A82-17855
THREE DIMENSIONAL MOTION
Three-dimensional analysis of cascade flutter in parallel shear flow
N82-15062
THROTTLING
External fuel vaporization study
[NASA-CR-165513] N82-14371
THRUST CONTROL
V/STOL propulsion control technology
[AIAA PAPER 81-2634] A82-16909
Optimal trajectories in supersonic flight
[AIAA PAPER 82-0366] A82-17906
THRUST REVERSAL
Thrust reversing effects on twin-engine aircraft having nonaxisymmetric nozzles
[AIAA PAPER 81-2639] A82-16911
THRUST VECTOR CONTROL
Ground test of a large scale 'D' vented thrust deflecting nozzle
[AIAA PAPER 81-2630] A82-16907
NASA V/STOL Propulsion Control Analysis - Phase I and II program status
[AIAA PAPER 81-2632] A82-16908
THUNDERSTORMS
Simulation of phugoid excitation due to hazardous wind shear
[AIAA PAPER 82-0215] A82-17844
TILT ROTOR RESEARCH AIRCRAFT PROGRAM
XV-15 Tilt Rotor fly-by-wire collective control demonstrator development specifications
[NASA-CR-166262] N82-15030
TILTING ROTORS
Advanced technology airfoil development for the XV-15 tilt-rotor vehicle
[AIAA PAPER 81-2623] A82-16906
TIME DIVISION MULTIPLE ACCESS
JTIDS distributed TDMA /DTDMA/ terminal development results with emphasis on relative navigation performance
A82-18152
TITANIUM ALLOYS
Advantages and limitations in the use of diverse materials for aircraft construction --- composite versus metallic materials
[SNIAS-811-551-104] N82-15011
TOOLING
Aircraft composite materials and structures
A82-16143
TORSIONAL STRESS
Flag-lag-torsional dynamics of extensional and inextensional rotor blades in hover and in forward flight
[NASA-CR-165078] N82-15013
TORSIONAL VIBRATION
Torsional vibrations of a wing carrying a concentrated load /asymptotic behavior/
A82-18620
TRACKING (POSITION)
A general aviation simulator evaluation of a rate-enhanced instrument landing system display
[NASA-TP-1960] N82-14085
TRACKING NETWORKS
PLRS engineering development testing - Early results --- Position Location Reporting System with data communication network for community users in tactical environment
A82-18157
TRAILING EDGES
Computation of the steady viscous flow over a tri-element 'augmentor wing' airfoil
[AIAA PAPER 82-0021] A82-17735
TRAILING-EDGE FLAPS
Trailing edge flap influence on leading edge vortex flap aerodynamics
[AIAA PAPER 82-0128] A82-17799
TRAJECTORY ANALYSIS
Constant L/D glide trajectories
[AIAA PAPER 82-0362] A82-17904
Sensor footprints and homing range of terminal guidance munition
[BMVG-FBWT-81-5] N82-15111
TRAJECTORY OPTIMIZATION
Numerical computation of optimal atmospheric trajectories involving staged vehicles
[AIAA PAPER 82-0360] A82-17902
Optimal trajectories in supersonic flight
[AIAA PAPER 82-0366] A82-17906
TRANSDUCERS
La Recherche Aerospatiale, Bi-monthly Bulletin No. 1981-2, March - April 1981 --- aerodynamic research
[ESA-TT-713] N82-14388
TRANSFER FUNCTIONS
Flutter mode suppression using hyperstable feedback
[AIAA PAPER 82-0368] A82-17908
TRANSFORMATIONS (MATHEMATICS)
A stable decentralized filtering implementation for JTIDS RelNav --- stable community relative navigation
A82-18156
TRANSMISSION LOSS
Development of a transmission loss test facility for light aircraft structures
A82-18728
TRANSONIC COMPRESSORS
Aerodynamic considerations in the prediction of unstalled supersonic flutter in transonic fans
N82-15058
TRANSONIC FLOW
Computational treatment of transonic canard-wing interactions
[AIAA PAPER 82-0161] A82-17814
A more-accurate transonic computational method for wing-body configurations
[AIAA PAPER 82-0162] A82-17815
Transonic three-dimension viscous-inviscid interaction for wing-body configuration analysis
[AIAA PAPER 82-0163] A82-17816
Relaxation solution for viscous transonic flow about fighter-type forebodies and afterbodies
[AIAA PAPER 82-0252] A82-17865
Computations of transonic flow over an oscillating airfoil with shock-induced separation
[AIAA PAPER 82-0350] A82-17900
A contribution to the hodograph method for shock-free transonic airfoil sections
A82-18022
Experimental investigation of a transonic potential flow around a symmetric airfoil
[NASA-TM-76676] N82-14057
TRANSONIC WIND TUNNELS
Three-dimensional flow studies on a slotted transonic wind tunnel wall
[AIAA PAPER 82-0230] A82-17855
Recent sidewall boundary-layer investigations with suction in the Langley 0.3-m Transonic Cryogenic Tunnel
[AIAA PAPER 82-0234] A82-17858
An afterbody drag balance --- transonic wind tunnel gages
[RAE-TM-AERO-1897] N82-14103
Research on an induction driven cryogenic wind tunnel
N82-14394
Longitudinal and lateral static stability and control characteristics of a 1/6-scale model of a remotely piloted research vehicle with a supercritical wing
[NASA-TP-1360] N82-15075

TRANSPORT AIRCRAFT
  The well tempered transport aircraft engine /The Sir Henry Royce Memorial Lecture/ A82-16145
  Productivity and safety --- reducing transport aircraft operating costs and increasing safety A82-17284

Wind tunnel model tests support the hypothesis that a propeller tip vortex may subject a downstream wing surface to greater excitation than would be experienced by the aircraft fuselage side wall exposed to propeller-generated noise, ultimately transmitting this structural response to incident dynamic pressure to the cabin interior. Even if structure-borne excitations are less efficient than airborne excitations in the creation of cabin noise, the higher level of the former could still govern cabin noise levels. O.C.

A82-17604 # **Estimate of human control over mid-air collisions.** J. N. Anno (Research Dynamics, Inc., Cincinnati, OH). *Journal of Aircraft*, vol. 19, Jan. 1982, p. 86-88. 5 refs.

A comparison between random collision theoretical predictions and actual cases shows that while human control is very effective in air-carrier mid-air collision accidents, it is relatively ineffective in general aviation. This discrepancy may be due to traffic control, pilot training, or instrumentation. The greatest weakness of the analysis presented is the arbitrary choice of representative aircraft for the two groups considered. A more detailed analysis for general aviation aircraft is called for. O.C.

A82-17605 # **Subsonic flow over airborne optical turrets.** A. J. Laderman (Ford Aerospace and Communications Corp., Newport Beach, CA) and R. de Jonckheere (USAF, Weapons Laboratory, Kirtland AFB, NM). *Journal of Aircraft*, vol. 19, Jan. 1982, p. 88-90. 6 refs. Contract No. F2960-79-C-0010.

It is shown that a good estimate of the pressure coefficient distribution of an airborne optical turret can be provided by means of an incompressible, inviscid code, which succeeds in (1) rationalizing the results of wind tunnel test measurements and (2) accounts for the effects of turret configuration. Compressibility effects are found to be small for the freestream Mach number range considered, but an improved agreement between data and analysis is obtained by using the code in conjunction with the compressibility correction proposed. O.C.

A82-17606 # **ADEN plume flow properties for infrared analysis.** C.-W. Chu and J. Der, Jr. (Northrop Corp., Aircraft Div., Hawthorne, CA). *Journal of Aircraft*, vol. 19, Jan. 1982, p. 90-92. 5 refs.

A simple modeling technique is described for the prediction of two-dimensional nozzle plume properties in IR signature analyses. Attention is given models for converging-diverging nozzles, augmented deflecting exhaust nozzles, and two-dimensional plug nozzles with and without bypass flow and/or engine swirl. A 10-deg engine swirl was found to reduce predicted plume temperature to the extent that, although swirl is undesirable from the point of view of performance, it must be recommended for two-dimensional nozzle plume IR signature reduction. O.C.

A82-17607 # **Take-off ground roll of propeller driven aircraft.** R. J. Hawks (Tri-State University, Angola, IN). *Journal of Aircraft*, vol. 19, Jan. 1982, p. 92, 93. 5 refs.

The solution to the acceleration problem for constant power with aerodynamic drag, including lift, developed by Hawks and Sayre (1973) is applied to the take-off ground roll problem in propeller driven aircraft. The major difficulty with the constant power calculation is that the static thrust has to be infinite in order for true constant power to be maintained. The problem is avoided by treating thrust as constant at the static thrust value up to the speed where the static thrust would produce the rated thrust-power, and then treating the power as constant above that speed. O.C.

A82-17608 # **Kelvin-Helmholtz stability analysis of air cushion landing gear trunk flutter.** M. Hinchey and P. Sullivan (Toronto, University, Toronto, Ontario, Canada). *Journal of Aircraft*, vol. 19, Jan. 1982, p. 94-96. Research supported by the Natural Sciences and Engineering Research Council of Canada.

It is shown that a Kelvin-Helmholtz linear stability analysis, similar to those used for aeroelastic problems such as panel flutter, predicts a divergent oscillation at the conditions for which flutter was observed during the development of bag or trunk-type air cushion landing gear. The flutter is therefore not neccessarily the result of a static instability, as suggested by Boghani and Fish (1979). The trunk is modeled locally as a membrane of infinite extent, set parallel to the ground plane. O.C.

A82-17714 * **Calculations of lightning return stroke electric and magnetic fields above ground.** M. J. Master, M. A. Uman, Y. T. Ling, and R. B. Standler (Florida, University, Gainesville, FL). *Journal of Geophysical Research*, vol. 86, Dec. 20, 1981, p. 12127-12132. 16 refs. NSF Grant No. ATM-79-02627; Grant No. NGR-10-005-169; Contracts No. N00014-81-K-0177; No. F33615-79-C-3412.

Lin et al., (1980) presented a lightning return stroke model with which return stroke electric and magnetic fields measured at ground level could be reproduced. This model and a modified version of it, in which the initial current peak decays with height above ground, are used to compute waveforms for altitudes from 0-10 km and at ranges of 20 m to 10 km. Both the original and modified models gave accurate predictions of measured ground-based fields. The use of the calculated fields in calibrating airborne field measurements from simultaneous ground and airborne data is discussed. J.F.

A82-17733 # **Mesoscale convective weather systems and aviation operations.** R. A. Maddox and J. M. Fritsch (NOAA, Office of Weather Research and Modification, Boulder, CO). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0015*. 9 p. 10 refs.

Enhanced, infrared satellite imagery is used to reveal that meso-alpha scale convective weather systems often develop and move across the central and eastern United States. The convectively driven weather systems are called mesoscale convective complexes (MCC), and are accompanied by a variety of weather phenomena. A comparison is made of 200 mb winds with numerical forecasts, which indicates that MCCs produce large changes in the airflow within atmospheric layers heavily traversed by commercial aircraft. Examples of MCCs and their impact on aircraft operations and actual flights are also discussed. D.L.G.

A82-17734 # **The Joint Airport Weather Studies project.** J. McCarthy, J. W. Wilson (National Center for Atmospheric Research, Boulder, CO), and T. T. Fujita (Chicago, University, Chicago, IL). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0017*. 9 p. 19 refs.

Convective microburst events are analyzed and objectives of the summer, 1982 Joint Airport Weather Studies (JAWS) project are outlined. Microbursts occur on a horizontal scale of 1-4 km (misoscale), and comprise small, strong downdrafts, which cause outflows at ground level resulting in winds exceeding 40 mph. A continued outflow may lead to a gust front, a feature present in squall lines. JAWS facilities include three Doppler radars, two research aircraft, three rawinsonde units, a lightning detection system, and the Portable Automated Mesonet. High resolution data on downdrafts will provide four-dimensional details of dynamic forcing mechanisms of microbursts for modelling such events in computer simulations. The modelling will further serve for understanding the behavior of aircraft in a wind shear environment and determining the causes of microburst events. M.S.K.

A82-17735 * # **Computation of the steady viscous flow over a tri-element 'augmentor wing' airfoil.** T. A. Lasinski, A. E. Andrews, R. L. Sorenson, D. S. Chaussee, T. H. Pulliam, and P. Kutler (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0021*. 16 p. 14 refs.

The augmentor wing consists of a main airfoil with a slotted trailing edge for blowing, and two smaller aft airfoils which shroud the jet. This configuration has been modeled for numerical simulation by a novel discretization procedure which generates four separate grids: three surface-oriented airfoil grids and one outer free-stream grid. Grid lines and slopes are continuous across boundaries, so grid overlap at common boundaries provides boundary information without interpolation. A two-dimensional unsteady thin-layer Navier-Stokes code is used to calculate the flow for the no-blowing case at freestream Mach number = 0.7, Re = 12,600.000, and angles-of-incidence = 1.05 deg. Qualitative agreement with experimental data indicates the utility of this procedure in the analysis of multi-element configurations. (Author)

A82-17753 * # **Screech suppression in supersonic jets.** T. D. Norum (NASA, Langley Research Center, Hampton, VA). *American*

Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0050. 9 p. 12 refs.

Jet screech from underexpanded sonic nozzles has been investigated experimentally. Multiple screech modes, or stages, are found to be present at some jet operating conditions. The fundamental screech tone of each mode attains a maximum amplitude at about 20 deg from the inlet axis, with higher harmonics exhibiting multiple lobes. The directivity of each harmonic is predicted quite well from a stationary array of acoustic monopoles, with phasing between consecutive monopoles determined by the shock cell spacing and eddy convection velocity. Large reduction of screech amplitude can be obtained from modifications to the nozzle exit, although the extent of this suppression is mode dependent. (Author)

A82-17785 # **Wind tunnel investigations for the flat spin of slender bodies at high angles of attack.** H. Kubota, I. Arai, and M. Matsuzaka (Tokyo, University, Tokyo, Japan). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0054.* 12 p. 16 refs. Research supported by the Ministry of Education of Japan.

Low speed wind tunnel investigations for the flat spin of slender bodies at high angles of attack at Reynolds number of 120,000-440,000 are conducted. Effects of geometrical configuration of model, free stream Reynolds number and angle of attack on the flat spin motion are studied with spin rate measurement, associated in situ surface pressure distribution and static side force measurements. It is verified that the occurrence of the flat spin is caused by the difference of flow separation patterns near the critical Reynolds number region. The flat spin motion can be alleviated by making turbulent separation with the use of surface roughness. (Author)

A82-17788 * # **A simple finite difference procedure for the vortex controlled diffuser.** A. A. Busnaina and D. G. Lilley (Oklahoma State University, Stillwater, OK). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0109.* 9 p. 21 refs. USAF-supported research; Grant No. NAG3-74.

A simple prediction procedure for sudden expansion incompressible flows is developed and applied to the vortex controlled diffuser. Transient Navier-Stokes equations of an incompressible fluid are solved by means of their associated finite difference equations in terms of the primitive pressure velocity variables. A computer code is developed using a laminar flow simulation with free slip or no slip wall boundary conditions. In addition, predicted results confirm that effectiveness increases with increases in duct length and bleed flow rate. D.L.G.

A82-17791 # **Widely-spaced co-axial jet, diffusion-flame combustor - Isothermal flow calculations using the two-equation turbulence model.** G. J. Sturgess and S. A. Syed (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0113.* 13 p. 20 refs.

A numerical simulation of the isothermal flow in the Wright Aeronautical Propulsion Laboratory diffusion-flame research combustor is carried out. An axisymmetric finite difference solution of the time-averaged, steady-state, elliptic form of the Reynolds equations is used with closure provided by a two-equation turbulence model. Although the simulation gives acceptable agreement with experimental data in many respects, it is deficient in predicting the recovery rate of a central near-wake region. Several possible explanations for this failure are explored and it is hypothesized that the most probable cause is an inability in the turbulence model to account for the effects on Reynolds stresses of streamwise curvature of the streamlines. (Author)

A82-17793 * # **An iterative finite element-integral technique for predicting sound radiation from turbofan inlets in steady flight.** S. J. Horowitz, R. K. Sigman, and B. T. Zinn (Georgia Institute of Technology, Atlanta, GA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0124.* 9 p. 23 refs. Grant No. NsG-3036.

A new iterative solution technique for predicting the sound field radiated from a turbofan inlet in steady flight is presented. The sound field is divided into two regions: the sound field within and near the inlet which is computed using the finite element method and the radiation field beyond the inlet which is calculated using an integral solution technique. A continuous solution is obtained by matching the finite element and integral solutions at the interface between the two regions. The applicability of the iterative technique is demonstrated by comparison of experimental results with the theoretical results for several different inlet configurations with and without flow. These examples show that good agreement between experiment and theory is obtained within five iterations. (Author)

A82-17796 # **Unsteady flow patterns associated with spoiler control devices.** A. Ayoub, B. Satyanarayana, K. Karamcheti (Stanford University, Stanford, CA), and H. C. Seetharam (Boeing Commercial Airplane Co., Seattle, WA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0127.* 9 p.

The unsteady flow field past a Boeing research airfoil fitted with a spoiler has been examined using surface pressure measurements as well as a limited number of velocity measurements in and outside the boundary layer. Definite flow patterns associated with the process of vortex shedding were sought in an effort to establish some correlation with the performance of the spoiler as a lift control device. The flow patterns were found to be complex and not easily reconcilable with known notions about the flow in general. The flow details at two different Reynolds numbers (based on the chord), 2.62 x 10 to the 5th and 5.18 x 10 to the 5th, and three spoiler deflection angles are presented and discussed. (Author)

A82-17799 # **Trailing edge flap influence on leading edge vortex flap aerodynamics.** J. F. Marchman, III and A. C. Grantz (Virginia Polytechnic Institute and State University, Blacksburg, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0128.* 7 p. 6 refs.

A study was conducted to explore the effects of trailing edge flaps (TEF) on leading edge vortex flap (LEVF) aerodynamics. A variety of LEVF and TEF configurations were tested on flat plate delta wings with leading edge sweep angles of 60 and 75 degrees. Results indicated that the well established vortex flowfield of the 75 degree wing was not substantially improved due to the deflection of trailing edge flaps. Significant changes were seen to occur to the marginal vortices of the 60 degree wing. For the 60 degree wing with inverted constant chord LEVFs the deflection of TEFs resulted in substantial increases in life coefficient at low angles of attack without sacrificing other performance parameters. Also shown was the capability for eliminating the adverse longitudinal characteristics of constant chord LEVFs. (Author)

A82-17800 # **Optimal subsonic diffuser wall design for arbitrary entry conditions.** J. L. Livesey and M. Hersel (Salford, University, Salford, Lancs., England). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0132.* 6 p.

Pressure gain in diffusers is basically limited by the flow separation. It is possible theoretically to determine the design of a diffuser with the limiting condition of flow separation occurring throughout. The cross-sectional variation as a function of location in the diffuser, in order to achieve optimal pressure gain, is thus determinable. An attempt has been made to predict, through an integral boundary layer method, the shape of a diffuser with optimal pressure gain. The entry condition is quite general (Reynolds number, Mach number, profile shape, momentum thickness and turbulence). The optimization in the present model is based on the assumption of constant profile shape (Hsep) and zero skin friction. The general effects of each individual entry parameter on the final design shape are discussed, and the general indications are that the pressure recovery of the present optimal diffusers are higher than those of conical diffusers of the same area ratios and that conical diffusers are comparable to the optimal shapes for high inlet Mach numbers. (Author)

A82-17814 # **Computational treatment of transonic canard-wing interactions.** V. Shankar and N. Malmuth (Rockwell International Science Center, Thousand Oaks, CA). *American Institute of*

The numerical method of discrete vortices is used for a comparative analysis of some results on the total and distributed aerodynamic characteristics of thin wings with control surfaces. Attention is given to the solution of the problem in the linear formulation and to the solution of the problem with allowance for the spatial distribution of vortices. B.J.

A82-18590 † **Calculation of the unsteady loads on the surface of a moving wedge with an incident shock wave (Raschet nestatsionarnykh nagruzok, deistvuiushchikh na poverkhnost' dvizhushchegosia klina pri padenii na nego udarnoi volny).** R. Ia. Tugazakov. *TsAGI, Uchenye Zapiski,* vol. 12, no. 1, 1981, p. 134-138. In Russian.

The maximum pressure on the surface of a moving wedge with an incident shock wave is calculated. Pressure on the body is determined as a function of the intensity of the incident wave and the angle of incidence when the intensity of the bow wave is equal to that of the incident wave. Hypersonic small-perturbation theory is used to study the influence of the contact discontinuity on the pressure distribution on the wedge surface. A decrease in the adiabatic exponent leads to an intensification of the unsteady effects. B.J.

A82-18591 † **The effect of the cooling of the wing surface on laminar-to-turbulent boundary layer transition at supersonic flow velocities (Vliianie okhlazhdeniia poverkhnosti kryla na perekhod laminarnogo pogranichnogo sloia v turbulentnyi pri sverkhzvukovykh skorostiakh potoka).** V. A. Kuz'minskii. *TsAGI, Uchenye Zapiski,* vol. 12, no. 1, 1981, p. 139-144. In Russian.

The influence of the cooling of a straight-wing model on the laminar-to-turbulent boundary layer transition was studied in a wind tunnel at Mach numbers of 1.8, 2.0, and 2.5, and Reynolds numbers (for one meter of length) in the ranges (11.7-16.9) x 10 to the 6th and (23.4-27.3) x 10 to the 6th. An analysis of experimental results shows that asymmetric cooling of the wing surface leads to an asymmetric development of the laminar-to-turbulent transition. B.J.

A82-18596 † **A study of the effect of the flight vehicle body potential on the characteristics of ion attitude transmitters (Issledovanie vliianiia potentsiala korpusa letatel'nogo apparata na kharakteristiki ionnykh datchikov orientatsii).** G. V. Eniutin, V. V. Skvortsov, and A. A. Uspenskii. *TsAGI, Uchenye Zapiski,* vol. 12, no. 1, 1981, p. 166-172. In Russian.

The effect of the flight vehicle body potential on the angular characteristics of ion attitude transmitters has been modeled experimentally in an ionized gas flow with parameters similar to those of the ionosphere. Possible ways to suppress this effect are examined, including the use of metal disks and screen grids in front of the transmitters. V.L.

A82-18612 † **Application of the finite element method to the calculation of the modes and frequencies of natural vibrations of aircraft structures (Primenenie metoda konechnykh elementov k raschetu form i chastot sobstvennykh kolebanii aviatsionnykh konstruktsii).** T. V. Snisarenko. *TsAGI, Uchenye Zapiski,* vol. 12, no. 1, 1981, p. 137-140. 6 refs. In Russian.

The paper develops a method for calculating the modes and frequencies of natural vibrations based on the finite-element modeling of the elastic and mass properties of the structure. An algorithm for solving the incomplete eigenvalue problem for a system of high-order equations is examined. The natural vibrations of a cylindrical shell are calculated as an example. B.J.

A82-18620 † **Torsional vibrations of a wing carrying a concentrated load /asymptotic behavior/ (Krutil'nye kolebaniia kryla, nesushchego sosredotochennyi gruz /asimptotika/).** Ia. M. Parkhomovskii. *TsAGI, Uchenye Zapiski,* vol. 12, no. 3, 1981, p. 69-82. In Russian.

Asymptotic formulas are obtained for the frequencies and modes of torsional vibrations of a wing carrying a concentrated load. These formulas are used to study the characteristics of the higher tones of the torsional vibrations. Results are presented for loads elastically and rigidly attached to the wing. B.J.

A82-18621 † **Calculation of the stability of crosswise-reinforced cylindrical shells (K raschetu ustoichivosti karkasirovannykh tsilindvicheskikh obolochek).** G. N. Zamula and K. M. Ierusalimskii. *TsAGI, Uchenye Zapiski,* vol. 12, no. 3, 1981, p. 83-94. 9 refs. In Russian.

General equations of stability and thermal stability are obtained for crosswise-reinforced noncircular cylindrical shells. The analysis takes into account nonuniform loading, variable stiffness, the anisotropy of the structure, and nonlinear effects. The equations make it possible to analyze the shell stability with allowance for the plastic state of the material and the buckling of the skin. The development of computational algorithms for this stability analysis is considered. B.J.

A82-18691 # **Fluidics in aircraft engine controls.** G. E. Davies (Plessey Aerospace, Ltd., Fareham, Hants., England). *ASME, Transactions, Journal of Dynamic Systems, Measurement, and Control,* vol. 103, Dec. 1981, p. 324-330. 6 refs.

Fluidics may be used to measure pressure ratio as a fundamental engine performance parameter using simple robust components, capable of withstanding high pressures and temperatures, and severe vibration. It improves the accuracy of measurement, and obviates the need of conventional systems to utilize nonoptimum, but easier to control parameters. A wide range of aircraft engine controls has been developed, including those for compressor inlet guide vanes, compressor bleed valves, engine fuel flow, and instrumentation. Total fluidic unit deliveries are now over 4200, and the civil operating hours exceed 13.5 million. A completely fluidic engine control is proposed with an electronic computer-controlled trim system for efficiency optimization. J.F.

A82-18726 **Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, North Carolina State University, Raleigh, NC, June 8-10, 1981.** Conference sponsored by the North Carolina State University and the Institute of Noise Control Engineering. Edited by L. H. Royster, F. D. Hart (North Carolina State University, Raleigh, NC), and N. D. Stewart (Acoustical Consultants, Inc., Gary, NC). Poughkeepsie, NY, Noise Control Foundation, 1981. 482 p. $42.

Topics discussed include noise control regulations and benefits, noise source identification, and the applications of damping materials. Papers are presented on Federal control technology initiatives in occupational noise, sound power measurement using the cross-spectral technique, low frequency noise reduction of acoustic enclosures, and the reflection and absorption of high-intensity sound at the surface of bulk porous materials. Attention is also given to nonacoustic design parameters for industrial mufflers, to educational programs for hearing conservation, and to a finite element analysis applied to open-end spinning noise. C.R.

A82-18727 **Reduction of the acoustic environment in an F100-PW-100 engine test cell.** V. R. Miller (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH). In: Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, Raleigh, NC, June 8-10, 1981. Poughkeepsie, NY, Noise Control Foundation, 1981, p. 257-260. 5 refs.

It is found that adding the acoustic treatment to the modification of the ejector tube lowers the acoustic environment in the test cell. The measured acoustic levels after modifications are below the design levels for engine structures as close as 40 inches ahead of the engine exhaust plane for maximum afterburner for the aft ejector tube position (AETP) and standard ejector tube position (SETP) configurations. The acoustic environment in the modified test cell is found to be lowest when the ejector tube is in the aft position (AETP). The measured acoustic levels exceed the design levels for engine structure with engine operation at the forward ejector tube position (FETP) configuration at maximum afterburner. C.R.

A82-18728 **Development of a transmission loss test facility for light aircraft structures.** C. K. Barton (Garrett Turbine Engine Co., Phoenix, AZ). In: Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, Raleigh, NC, June 8-10, 1981. Poughkeepsie, NY, Noise Control Foundation, 1981, p. 265-268.

The development of a transmission loss (TL) test facility designed specifically for light aircraft structures is described, and preliminary data obtained in the new facility are presented. The facility features automated control of the entire measurement procedure through the use of a desk-top computer interfaced with digital relays and a one-third octave frequency analyzer. The computer is programmed to start and stop the sound sources, switch microphones for the analyzer, and operate the analyzer. C.R.

A82-18729 * **Acceleration response of fuselage sidewall panels on a twin-engine, light aircraft.** L. A. Roussos and J. S. Mixson (NASA, Langley Research Center, Hampton, VA). In: Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, Raleigh, NC, June 8-10, 1981. Poughkeepsie, NY, Noise Control Foundation, 1981, p. 291-294.

A response analysis is carried out to determine the predictability of sidewall accelerations in aircraft, to investigate whether it is necessary to model the exterior pressure as a traveling wave as opposed to a standing wave, and to determine the importance of parameters describing the exterior pressure and sidewall panel. Prediction of the acceleration response is found to be improved by including traveling wave and spatial variation effects of the exterior pressure in the model. Variations with propeller rpm are found to be important for the longer panel. C.R.

A82-18730 **Noise control plan for a new airplane manufacturing facility.** M. D. Lockleer and R. C. Klein (Boeing Commercial Airplane Co., Seattle, WA). In: Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, Raleigh, NC, June 8-10, 1981. Poughkeepsie, NY, Noise Control Foundation, 1981, p. 299-302.

The work done by a noise technology staff in designing a noise control treatment for a new factory that had already been designed and had an established floor plan is described. The staff also had the responsibility of estimating noise levels in the new factory before it was completed. The noise-estimating procedures were based on acquiring noise measurements in a similar manufacturing facility with comparable enclosed area dimensions, production activities, and room characteristics. Noise was measured along the periphery of each area by recording the dBA level for a period of one minute. These noise levels were then transferred onto the new factory floor layout, where they were adjusted to account for work cycle, density of work parts, and number of production workers per unit area. C.R.

A82-18731 **Noise monitoring in airport communities.** W. K. Connor (Tracor, Inc., Austin, TX). In: Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, Raleigh, NC, June 8-10, 1981. Poughkeepsie, NY, Noise Control Foundation, 1981, p. 401-406. 6 refs.

Current noise monitoring practices at airports are surveyed, with emphasis placed on extent, implementation, and rationale. It is noted that contemporary aircraft monitoring systems can perform a wide variety of functions in support of an airport noise abatement program. In establishing a system, the importance of developing the program before locating the stations and specifying functions is stressed. Among the basic design considerations are the location and type of the central station, the number and locations of the remote stations, the type of data output, the amount of data to be stored, and the operating costs. C.R.

A82-18732 * **Quantification of airport community noise impact in terms of noise levels, population density, and human subjective response.** R. DeLoach (NASA, Langley Research Center, Hampton, VA). In: Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, Raleigh, NC, June 8-10, 1981. Poughkeepsie, NY, Noise Control Foundation, 1981, p. 419-422. 7 refs.

The Fraction Impact Method (FIM), developed by the National Research Council (NRC) for assessing the amount and physiological effect of noise, is described. Here, the number of people exposed to a given level of noise is multiplied by a weighting factor that depends on noise level. It is pointed out that the Aircraft-noise Levels and Annoyance MOdel (ALAMO), recently developed at NASA Langley Research Center, can perform the NRC fractional impact calculations for given modes of operation at any U.S. airport. The sensitivity of these calculations to errors in estimates of population, noise level, and human subjective response is discussed. It is found that a change in source noise causes a substantially smaller change in contour area than would be predicted simply on the basis of inverse square law considerations. Another finding is that the impact calculations are generally less sensitive to source noise errors than to systematic errors in population or subjective response. C.R.

A82-18776 **The structure of a separating turbulent boundary layer. I - Mean flow and Reynolds stresses. II - Higher-order turbulence results.** R. L. Simpson, Y.-T. Chew, and B. G. Shivaprasad (Southern Methodist University, Dallas, TX). *Journal of Fluid Mechanics*, vol. 113, Dec. 1981, p. 23-51, 53-73. 60 refs. Navy-supported research. Project SQUID.

The structure of a separating turbulent boundary layer was studied experimentally for an airfoil-type flow. Reynolds stress and mean flow were determined, and results are provided for velocity probability distribution flatness and skewness factors for higher order turbulence. The flow was accelerated and decelerated until separation occurred, and measurements were made by hot-wire and laser anemometry. A small mean backflow in the separation is found to be supplied intermittently by large-scale structures passing through the separated flow. This mechanism is suggested to be dominant only when the thickness of the backflow region is small compared with the turbulent shear-layer thickness. M.S.K.

A82-18837 # **The application of bifurcation theory to the study of loss of control over combat aircraft (Application de la théorie des bifurcations à l'étude des pertes de contrôle sur avion de combat).** P. Guicheteau (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(NATO, AGARD, Symposium on Combat Aircraft Maneuverability, Florence, Italy, Oct. 5-8, 1981.) ONERA, TP* no. 1981-100, 1981. 14 p. 8 refs. In French.

Nonlinear models of aircraft in spin and loss of control conditions are constructed using bifurcation theory. The cases of Riemann-Hugoniot catastrophe and Hopf bifurcation are considered, and bifurcation and the mechanics of flight are analyzed. A nonlinear model without hysteresis, with angles of attack ranging from -10 to 90 deg and slip angles from -40 to 40 deg is developed for combat aircraft with high wings and back empennage. Behavior at high angles of attack is discussed in terms of regaining control in movements transverse to the depth of the fixed position and in movements of pure depth. Areas of equilibrium of the flight envelope are defined for escaping from the hazardous situations. M.S.K.

emissions characteristics were experienced with each injector type even though the aerodynamic configuration was common to most combustor models. Performance characteristics obtained with the various fuel injector types could not have been predicted from bench-test injector spray characteristics. The effect of the number of operating fuel injectors on performance and emissions is also presented. Author

INTERACTIVE-GRAPHIC FLOWPATH PLOTTING FOR TURBINE ENGINES
Robert R. Corban Nov. 1981 51 p refs
(NASA-TM-82756; E-1074) Avail: NTIS HC A04/MF A01 CSCL 21E

An engine cycle program capable of simulating the design and off-design performance of arbitrary turbine engines, and a computer code which, when used in conjunction with the cycle code, can predict the weight of the engines are described. A graphics subroutine was added to the code to enable the engineer to visualize the designed engine with more clarity by producing an overall view of the designed engine for output on a graphics device using IBM-370 graphics subroutines. In addition, with the engine drawn on a graphics screen, the program allows for the interactive user to make changes to the inputs to the code for the engine to be redrawn and reweighed. These improvements allow better use of the code in conjunction with the engine program. T.M.

AEROELASTICITY IN TURBOMACHINES
P. Suter, ed. Zurich Juris-Verlag 1981 487 p refs Proc. of 2nd Intern. Symposium, Lausanne, Switzerland, 8-12 Sep. 1980
(EPFL-ITA-10; ISBN-3-260-04871-5) Avail: Issuing Activity

The understanding and prevention of failures in turbomachines caused by aeroelastic blade vibrations is considered. Calculation of subsonic cascades, cascade tests, vibration measurements and annular cascade tests, unsteady supersonic flow in cascades, and theoretical methods are discussed.

N82-15047 Tokyo Univ. (Japan). Inst. of Space and Aeronautical Sciences.
AERODYNAMIC RESPONSE OF A BLADE IN PITCHING OSCILLATION WITH PARTIAL AND FULL SEPARATION
H. Tanaka, I. Fujimoto, and S. Ishii *In* Ecole Polytechnique de Lausanne Aeroelasticity in Turbomachines 1981 p 129-142 refs
Avail: Issuing Activity

The aerodynamic responses of a blade in pitching oscillation with separation bubble and trailing edge separation are analyzed, and the mechanism of energy transfer between the oscillating blade and the air flow is elucidated. In the state of partial separation and leading edge separation, the aerodynamic response of a Goe801 model airfoil vibrating in pitching motion around a midchord of the blade was observed in a blowdown low speed wind tunnel. The dynamic pressure distribution along the blade surface was measured. By considering physical phenomena on the blade surface, it is understood how the phase shift of the unsteady pressure on the blade surface is affected by the deformation of the pressure wave caused by the movement of the reattaching point of the separation bubble and the separation point of trailing edge separation. DAMPING FOR TURBOMACHINE BLADE VARIATIONS IN SUBSONIC FLOW
G. S. Pisarenko, A. A. Kaminer, V. A. Balalayev, N. Y. Nastenko, A. L. Stelmach, and A. V. Dunayev *In its* Aeroelasticity in Turbomachinery 1981 p 151-161 refs

Avail: Issuing Activity

The reduction of dynamic stresses in turbomachine blades through an increase in aerodynamic damping of blade vibration is discussed. The influence of camber and stagger angle are investigated. An aeroelastic damping analysis for the case of stalled flow is presented. An experimental investigation of aerodynamic damping for planar bending and torsional vibrations of a flat cascade of model blades was carried out. In the range of camber variation from 0.025 to 1.0 dependence turns out not to be substantial; increased aerodynamic damping that never exceeds 10 to 15% accompanies an increase in camber. The influence of stagger angle on damping is also revealed to be relatively slight for angle variations from 0 to 60 deg. Author (ESA)

SELF EXCITED FLOW OSCILLATION IN THE LOW PRESSURE STEAM TURBINE CASCADE
T. Araki, Y. Okamoto, and F. Ohtomo *In* Ecole Polytechnique de Lausanne Aeroelasticity in Turbomachines 1981 p 171-186 refs
Avail: Issuing Activity

The problem of unsteady flow in a turbine cascade with subsonic inlet and supersonic outlet flow was approached through experiments. The type of flow considered occurs at the tip of the last stages of low pressure steam turbine rotors. Experiments were made on a linear cascade over a range of outlet Mach numbers up to 1.8. The measurements included unsteady flow visualization by the Schlieren method and time traces of pressure on the blade surface by transducers on nonoscillating and oscillating blades. In addition, unsteady aerodynamic moments were measured. Results show that the transonic flow field at the tip section of the rotor blades of large steam turbines is steady, operating at rated conditions. Operating under partial load, the steady flow breaks down. Aerodynamic damping in pitching motion for unsteady flow conditions is negative, leading to the possibility that self excited vibration exists in the case of a free standing blade. Author (ESA)

STABILITY AND FLUTTER ANALYSIS OF TURBINE BLADES AT LOW SPEED
T. J. Akai and H. Atassi *In* Ecole Polytechnique de Lausanne Aeroelasticity in Turbomachines 1981 p 187-201 refs

(Contract F49620-78-C-0014)
Avail: Issuing Activity

An aeroelastic analysis for highly loaded turbine blades at low speed is carried out for various vibratory modes. These include pure bending and torsion as well as coupled oscillatory modes. The analysis is based on a complete aerodynamic theory which fully accounts for the blade geometry, flow conditions and cascade parameters. A damping coefficient simulating structural damping is also included. The results clearly show that classical flutter can occur for low speed turbine cascades at typical operating conditions. This is directly attributable to high blade loading and thickness. Author (ESA)

CALCULATION OF QUASI-STATIONARY AERODYNAMIC FORCE ACTING ON A CASCADE OF OSCILLATING AIRFOILS IN SUBSONIC FLOW
V. B. Kurzin and V. P. Ryabchenko *In* Ecole Polytechnique de Lausanne Aeroelasticity of Turbomachines 1981 p 203-210 refs
Avail: Issuing Activity

Nonstationary aerodynamic characteristics of the cascade of thin airfoils in a subsonic gas flow are investigated showing that the influence of gas compressibility on their behavior can be characterized by two parameters: Mach number M and the wave number K. For the cascade of arbitrary airfoils, a theoretical statement of this problem for K tends to zero is considered; here nonstationary aerodynamic characteristics of the cascade are described well by their quasi-stationary approximation. A mathematical model of the nonstationary ideal gas flow at subsonic velocities through an arbitrary airfoil cascade in a quasi-stationary state is formulated. In accordance with the model, functions for the velocity potential wholly define the nonstationary gas flow through the cascade in a quasi-stationary approximation at any time moment. The determination problems for these functions are solved, using Chaplygin's approximation. Author (ESA)

NUMERICAL EXPERIMENTS ON UNSTEADY FLOWS

THROUGH VIBRATING CASCADES
Maurizio Pandolfi *In its* Aeroelasticity of Turbomachines 1981 p 211-228 refs
Avail: Issuing Activity

A numerical approach is presented for computing the inviscid compressible two-dimensional unsteady flow in a vibrating cascade. The full Euler equations are considered and no restrictive assumptions are required about geometry of the blading. The analysis is confined to subsonic flows. The modeling of the boundaries and the numerical methodology is described. Particular attention is paid to the explicit treatment of the wake behind the blade during the unsteady flow. Checks on the accuracy of the computations are made. Calculation results on the steady shockless transonic flow in an impulse cascade, where the exact solution is available, show acceptable agreement at least for the space-like discretization. Further evaluation of accuracy is hindered by a lack of benchmark solutions with which to compare. Author (ESA)

COMPUTER AIDED INVESTIGATION OF TURBOMACHINE AERODYNAMICS AND AEROELASTICITY
S. M. Belotserkovskii, A. S. Volmir, V. V. Kuleshov, M. I. Nisht, G. U. Stepanov, and R. M. Ejodorov *In its* Aeroelasticity of Turbomachines 1981 p 229-249 refs

Avail: Issuing Activity

Computer aided solutions of aeroelasticity problems related to turbomachines are presented. A synthesis of numerical methods from nonstationary aerodynamics and elasticity theory are employed. Solutions derive from an understanding of general characteristics and aerodynamic loads acting on each turbomachine blade while taking into account the interference of the blades and blade rows. Aerodynamic stationary characteristics, aerodynamic derivatives at various values of the vibration frequencies, and aerodynamic characteristics with arbitrary dependence of the kinematic parameters on time were investigated. Elastic deformation of blade and blade/disk systems is explained. A flow chart for the computerized evaluation of these phenomena is shown, the results of which support a turbomachine aeroelasticity mathematical model. Author (ESA)

ON THE NUMERICAL ANALYSIS OF STALL FLUTTER IN TURBINE CASCADES
S. Takahara, T. Adachi, and Y. Kadoya *In* Ecole Polytechnique de Lausanne Aeroelasticity of Turbomachines 1981 p 251-262 refs
Avail: Issuing Activity

A numerical method using a triangular finite element mesh pattern is applied in order to solve the problem of unsteady stalled flow through a turbine cascade. The flow in the blade-to-blade plane is assumed to be viscous, and in addition, the friction drag on the blade surface is considered. The basic equations for two-dimensional compressible viscous flow are described. Boundary conditions and a vibration condition are also explained. Numerical results for low pressure end blades of a steam turbine are compared with flutter test data on aerodynamic damping and satisfactory agreement is obtained between calculation and experiment. A METHOD FOR FORCE DETERMINATION FROM VIBRATION RESPONSE MEASUREMENTS
D. J. Ewins and B. Hillary *In* Ecole Polytechnique de Lausanne Aeroelasticity of Turbomachines 1981 p 263-283 refs
Sponsored by Rolls Royce Ltd.

Avail: Issuing Activity

Dynamic force determination from response measurements was studied numerically and experimentally. Application to turbomachine blades undergoing steady or transient vibration is considered. In theory, the case of harmonic excitation and response is expressed as an inverse input/output equation. A cantilever beam and an isolated turbomachine blade were used as test pieces for the experimental study. Results show that application of the pseudoinverse force determination method is subject to a form of conditioning in the region of the fundamental mode. However, the results of tests on an actual compressor blade suggest that with very accurate dynamic modeling of the test structure and careful curve fitting this method is feasible, using current techniques and equipment. CONTROL OF VIBRATION IN AEROELASTIC CASCADE EXPERIMENTS
A. Krischner, B. Fosco, and E. Muller *In* Ecole Polytechnique de Lausanne Aeroelasticity of Turbomachines 1981 p 285-296 refs
Avail: Issuing Activity

The aeroelastic behavior of an annular, transonic turbine cascade with three degrees of freedom and an electromagnetic excitation system was investigated. Excitation and vibration control which allows measurement of effective damping in the stable operating domain of the cascade is discussed. The vibration control system demonstrates its capability to maintain preset vibration amplitudes and interblade phase angles throughout the resonance range if sufficient damping is present. STABILITY ANALYSIS OF THE TWIN MODE MODEL OF COUPLED FLEXION/TORSION VIBRATIONS IN TURBOFANS
R. A. J. Ford *In* Ecole Polytechnique De Lausanne Aeroelasticity of Turbomachines 1981 p 297-308 refs

Avail: Issuing Activity

The twin mode representation of coupled flexion/torsion vibrations in turbofans, a linear feedback system which depicts flutter as a system instability, is reviewed. An analysis which uses classical automatic control theory is presented. A stability analysis for zero phase lag on aerodynamic coupling is developed. A transfer function for the system is found, and determination of stability using Routh's criterion is explained. A more versatile characterization of flutter behavior for the twin orthogonal mode model results. Author (ESA)

AERODYNAMIC CONSIDERATIONS IN THE PREDICTION OF UNSTALLED SUPERSONIC FLUTTER IN TRANSONIC FANS
D. G. Halliwell *In* Ecole Polytechnique de Lausanne Aeroelasticity of Turbomachines 1981 p 309-322 refs

Avail: Issuing Activity

Two methods for the prediction of unsteady lift and moment coefficients for blades with supersonic entry flow pertaining to coupled flutter in turbofans are discussed. The first method uses a linearized supersonic model, with only weak pressure waves, while the second uses a strong normal shock model, however both are based on flat plate cascades. A basic problem in the application of the first model is discussed and a correction procedure to obtain a more rational solution is suggested. For the second model, although its shock structure is closer to the real case, overall comparison with experiment shows no improvement on the simpler model. However, results are qualitatively consistent with implied working line differences. Author (ESA)

EFFECT OF MEAN BLADE LOADING ON SUPERSONIC CASCADE FLUTTER
M. Namba and R. Minami *In* Ecole Polytechnique de Lausanne Aeroelasticity of Turbomachines 1981 p 323-332 refs

Avail: Issuing Activity

A theory for supersonic cascade flutter with nonzero mean blade loadings was developed. An inviscid supersonic flow past a rectilinear two-dimensional cascade with subsonic leading edge locus was investigated. The theory allows for the effect of displacement of mass source and body force singular points which represent blades with nonzero thickness and mean lift force, but it neglects the effect of deviation of the local convection velocity and local speed of sound from the undisturbed uniform ones. The theory also predicts the occurrence of supersonic bending flutter at higher blade loadings. Author (ESA)

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal,* vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. C.R.

AERONAUTICAL ENGINEERING

A Continuing Bibliography (Suppl. 147)

APRIL 1982

IAA ENTRIES

A82-16025 **A high strength ejector release unit for the Tornado.** L. Botting (Normalair-Garrett, Ltd., Yeovil, Somerset, England). *Aircraft Engineering,* vol. 53, Nov. 1981, p. 10-15.

The development of bomb ejector release units (ERU) is traced, and an ERU suitable for the MACE form of suspension is described. The design of the ERU is provided, noting its use on the Tornado and its acceptability for NATO armaments. Reduced drag has been experienced by use of the ERU, and sway-bracing is achieved without crutch arms, although these can added with a conversion kit. A 3.3 m/sec ejection velocity has been measured for a store mass of 544 kg within a reaction limitation of 44.5 kn. The unit withstands 30 firings before maintenance, and recommendations for system alterations for use with smart weapons are outlined. M.S.K.

A82-16040 # **On unsteady aerodynamic forces and moments of the circular cascading blades /Experiments of the outward-flow case/.** K. Nishioka and H. Kuroda (National Defense Academy, Yokosuka, Kanagawa, Japan). *JSME, Bulletin,* vol. 24, Oct. 1981, p. 1739-1747. 15 refs.

The unsteady forces and moments acting on the blades of centrifugal machines which vibrate harmonically in a torsional mode about the mid-chord have been studied experimentally. At small interblade phase angles, the unsteady normal forces and moments are found to vary periodically as a function of the cascade geometry, flow coefficient, and the wake length of vortex distribution; for small flow coefficients, the damping moments become negative. When the interblade phase angle is more than 180 deg, the aerodynamic damping moment becomes negative for relatively small reduced frequencies. As the interblade phase angle increases still further, the damping moment becomes negative even at comparatively large reduced frequencies. Experimental results are in qualitative agreement with theory. V.L.

A82-16091 # **Workshop report for the AIAA 6th Aeroacoustics Conference.** C. K. W. Tam (Florida State University, Tallahassee, FL). *Journal of Aircraft,* vol. 18, Dec. 1981, p. 1005-1010. 5 refs.

Summaries are given of the workshops conducted at the AIAA 6th Aeroacoustics Conference, each summary having been prepared by the workshop chairmen. The six workshops are: jet noise, duct acoustics, turbomachinery noise, aircraft interior noise, airframe and propulsive lift noise, and propeller and helicopter noise. It is noted that the primary purpose of the workshops is to provide a forum where new ideas and concepts can be openly discussed and controversies freely debated. C.R.

A82-16092 # **Infrared emissions from turbofans with high aspect ratio nozzles.** R. Decher (Washington, University, Seattle, WA). *Journal of Aircraft,* vol. 18, Dec. 1981, p. 1025-1031. 12 refs.

A mixed flow turbofan is analyzed from the point of view of IR emission characteristics. A simple absorption coefficient model of the core flow gas displays the potential effectiveness of high aspect ratio nozzles as a variable in the design of aircraft engine installations for low IR signature. The simplicity of the model described and the limited view perspectives used to assess the signature restrict the usefulness of the results to that of guiding preliminary design. In general, more precise solutions are complex and depend on specification of a relatively large number of independent variables to describe the source - seeker geometry, weather, etc. The level of effort to carry out more accurate analysis may be inconsistent with the preliminary design process where simple criteria such as those described may be sufficient to select the best of several candidate designs. The influence of cycle parameters is assessed using an n-th power dependence of radiation on temperature and a simple mixing model to estimate the core length. The analysis shows that cycle parameters which improve cycle efficiency and thus fuel consumption also reduce IR emissions. Bypass ratio near unity gives low IR signature for both optically thin and thick spectral regions. (Author)

A82-16098 # **Symmetric flow characteristics of thin rectangular wings.** E. S. Larson (Flygtekniska Forsoksanstalten, Stockholm, Sweden). *Journal of Aircraft,* vol. 18, Dec. 1981, p. 1070, 1071. 7 refs. Research supported by the Defense Materiel Administration.

Semiempirical analytic expressions are presented which are shown to contain in themselves Mach number influences that are in very good agreement with the investigated panel method results for M less than or equal to 1, the intended regime of application of the equations. The differences between the equations and the theoretical results are small and in fact only of minor significance when shortcut evaluations are desired. It is noted, however, that a comparison with relevant transonic experimental results, if such results existed, would show an appreciable discrepancy in the transonic regime as a result of the neglect of genuine transonic terms in the linearized theory. C.R.

A82-16135 # **Aerospace highlights 1981.** *Astronautics and Aeronautics,* vol. 19, Dec. 1981, p. 24-34, 36-40, 42-108.

Topics such as air transportation systems, aeroacoustics, aerospace power systems, aircraft design, interactive computer graphics, and flight simulation are considered. Attention is also given to flight mechanics, extendible exit cones, general aviation systems, LTA vehicles, and testing programs. Plasma dynamics and lasers are discussed, as are solid rockets, propellants, software systems, sensors, marine technologies, and CAD/CAM. Finally, papers are presented on terrestrial energy systems, structural dynamics, space sciences, space structures, thermophysics, V/STOL aircraft, aerospace maintenance, communications, economics, and electric propulsion, as well as materials, management, and guidance and control. M.S.K.

A82-16143 **Aircraft composite materials and structures.** A. J. Dastin (Grumman Aerospace Corp., Advanced Development Section, Bethpage, NY). *SAMPE Journal,* vol. 17, Nov.-Dec. 1981, p. 10-15.

A ten year advanced composite aircraft structural history is reviewed. Composite material development is traced from fiberglass epoxy to mixed fiber polymer hybrids containing boron, graphite and Kevlar. Typical composites processing and tooling approaches utilized in the industry is given along with techniques being developed for high volume production. (Author)

A82-16148 **The well tempered transport aircraft engine /The Sir Henry Royce Memorial Lecture/.** J. G. Borger. *Aeronautical Journal,* vol. 85, Nov. 1981, p. 398-412.

An historical account is presented of the development, over 40

Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0161. 9 p. 9 refs. Contract No. F44620-81-C-0044.

The transonic canard-wing interaction problem is simulated using modified small disturbance (MSD) transonic theory. The wing and the canard are treated in a sheared fine grid system that is embedded in a global Cartesian crude grid. An appropriate far field and asymptotic expression for the velocity potential derived using Green's theorem is implemented. Results are presented for a few canard-wing configurations and compared with available experimental data. The weakening of the wing shock due to the presence of the canard downwash is illustrated in terms of contour plots. An empirical incidence correction for the wing leading edge vortex gives good agreement with experiment at low incidences. For higher angles of attack, the results indicate that a more sophisticated vortex roll-up and induction model is required. (Author)

A82-17815 # **A more-accurate transonic computational method for wing-body configurations.** L. T. Chen (McDonnell Douglas Research Laboratories, St. Louis, MO). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0162.* 10 p. 16 refs. Contract No. N000167-81-C-0057.

Second- and third-order, quasi-conservative and fully conservative schemes have been developed for computing inviscid flowfields about transonic wings. The fully conservative schemes are developed by modifying an existing finite-volume algorithm, while the quasi-conservative schemes are developed by solving a transformed full-potential equation with the addition of new second- or third-order artificial viscosities at supersonic points. A new shock-point operator is introduced, which adjusts the amount of nonconservative differencing at shock points and thus modifies the location and strength of captured shocks. Numerical results obtained using the second- and third-order schemes will be discussed and compared with experimental data. (Author)

A82-17816 * # **Transonic three-dimension viscous-inviscid interaction for wing-body configuration analysis.** E. G. Waggoner (Vought Corp., Dallas, TX). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0163.* 12 p. 16 refs. Contract No. NAS1-16055.

A three-dimensional small disturbance transonic analysis code has been coupled with a three-dimensional integral boundary layer code. A scheme was developed to interact the two codes through the use of a controlling module. The resulting hybrid code does not increase the costs or computer core requirements over that of the previous capabilities of the analysis code, which used a two-dimensional boundary layer analysis to model viscous effects. Several configurations have been analyzed and results compared against both experimental data and computational results using the two-dimensional viscous model. Results indicate good agreement with experimental data when using the three-dimensional interaction scheme, with the most marked improvement in the correlations observed for wing pressure coefficient predictions in the lower surface cusp region for supercritical wings. (Author)

A82-17820 # **Recent improvements in prediction techniques for supersonic weapon separation.** A. Cenko (Grumman Aerospace Corp., Bethpage, NY) and J. Waskiewicz (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0170.* 9 p. 7 refs. Contract No. F33615-81-3011.

The Influence Function Method (IFM) considered in the investigation has been reported by Meyer et al. (1981). The principal assumption is that a store's normal force and moment in a nonuniform flow can be correlated with the angle-of-attack distribution along the store length. At supersonic speeds, the influence coefficients A and B can be determined by traversing a store through an oblique shock generated by a wedge and measuring the normal force and moment along the traverse. Theoretically determined weapon/store influence coefficients for four stores are shown to yield accurate IFM store force and moment predictions. Considering the geometric dissimilarity of the stores examined in the study, it would appear that the use of theoretically determined influence coefficients is a practical and cost-effective alternative to the use of experimental weapon calibrations for IFM applications at supersonic speeds. G.R.

A82-17827 # **Determination of Learjet Longhorn airplane horizontal tail load and hinge moment characteristics from flight data.** G. D. Park and M. H. Abla (Gates Learjet Corp., Wichita, KS). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0183.* 8 p. 21 refs.

Gates Learjet Corporation recently received the type certificate for the Model 55 Longhorn, its newest and largest business jet aircraft. During the certification effort, the aircraft flight characteristics, as well as the horizontal tail airloads and elevator hinge moments, were evaluated from inflight response data. The purpose of these analyses were to verify the design airloads used in the documentation required for FAA certification. Two parameter identification computer programs developed by NASA were used. One was developed by Taylor and Iliff in 1972. The other was developed by Maine and Iliff in 1980. (Author)

A82-17828 # **A binary matrix technique for aircraft collision threat recognition and avoidance.** M. N. Wagdi (Riyadh, University, Riyadh, Saudi Arabia). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0184.* 9 p.

A new technique is presented for aircraft collision threat recognition and avoidance. The lateral plane of the airspace in front of own aircraft is represented by a square binary matrix, whose central element coincides with the own aircraft body axes system. Each element of the binary matrix defines an airspace cell with known area. The elements representing the flight domains of own and threat aircraft have digits 1 while all other elements are zeros. The binary matrix approach enables one to project the three dimensional threat information onto a two dimensional indicator. This is done through the introduction of the threat signal intensity concept. A possible collision threat is recognized when the digit in one of the cells bounding the own aircraft domain changes from 0 to 1. The location of such cell in the binary matrix indicates the threat bearing angles. An evasive maneuver based on such information is thus initiated. (Author)

A82-17831 # **3 DOF gyro analysis from measured and derived rates.** G. T. Chrusciel and N. J. French (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0189.* 13 p. 5 refs.

Hypersonic three degree-of-freedom (3DOF) angular motion reentry simulation tests were performed using telemetry of onboard rate gyro signals for direct extraction of the aerodynamic moments. Conditions are described which produced high quality signals during one test entry and intermittant loss of signal for a subsequent test. Body fixed angular rate data were reconstructed from the 3DOF balance angular position results; these compared well with the gyro data. Feasibility of using the AEDC 3DOF gas bearing angular data for extraction of moments is demonstrated by good agreement of aerodynamic moments extracted using the derived rates and gyro rates. (Author)

A82-17833 * # **Development and operating characteristics of an advanced two-stage combustor.** W. Greene, S. Tanrikut (United Technologies Corp., Commercial Products Div., East Hartford, CT), and D. E. Sokolowski (NASA, Lewis Research Center, Cleveland, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0191.* 14 p. 10 refs.

Results are presented from an experimental program aimed at optimizing the features of an advanced two-stage combustor that currently is being developed as part of the National Aeronautics and Space Administration/Pratt & Whitney Aircraft Energy Efficient Engine program. The combustor is designed to meet stringent goals for performance, emissions, durability and operational characteristics. An overview of the design selection process in light of these goals is discussed. Combustor rig test results, which highlight the techniques used to reduce emissions, development of the pilot and main power zone fuel injection systems, and methods of achieving efficient fuel staging, are presented. (Author)

A82-17838 * # **Water ingestion into jet engine axial compressors.** T. Tsuchiya and S. N. B. Murthy (Purdue University, West Lafayette, IN). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0196*. 11 p. 14 refs. Contract No. F33615-79-C-2401; Grant No. NAG3-02.

An axial flow compressor has been tested with water droplet ingestion under a variety of conditions. The results illustrate the manner in which the compressor pressure ratio, efficiency and surging characteristics are affected. A model for estimating the performance of a compressor during water ingestion has been developed and the predictions obtained compare favorably with the test results. It is then shown that with respect to five droplet-associated nonlinearly-interacting processes (namely, droplet-blade interactions, blade performance changes, centrifugal action, heat and mass transfer processes and droplet break-up), the initial water content and centrifugal action play the most dominant roles. (Author)

A82-17843 # **An experimental investigation of the influence of vertical wind shear on the aerodynamic characteristics of an airfoil.** F. M. Payne (Boeing Commercial Aircraft Co., Seattle, WA) and R. C. Nelson (Notre Dame, University, Notre Dame, IN). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0214*. 10 p. 17 refs. Research supported by the University of Notre Dame; U.S. Department of Transportation Contract No. RC-82010.

An experimental wind tunnel investigation was carried out to determine the influence of a vertical wind shear on the static longitudinal aerodynamic coefficients (i.e., the sectional drag, lift, and moment coefficients) of an airfoil. Force balance and surface pressure measurements were obtained from a NACA 0018 airfoil in a linear velocity gradient. The airfoil was tested in a Reynolds number range from 75,000 to 200,000, with endplates to simulate an infinite wing, and with the outboard endplate removed to simulate a finite wing. The effect of grit on the surface of the airfoil was also investigated. The influence of the velocity gradient on the aerodynamic characteristics of the airfoil was found to be small, especially in comparison to the effects of the grit. (Author)

A82-17844 * # **Simulation of phugoid excitation due to hazardous wind shear.** W. Frost (FWG Associates, Inc.; Tennessee, University, Space Institute, Tullahoma, TN), B. S. Turkel (Peachtree Dekalb Airport, Atlanta, GA), and J. McCarthy (National Center for Atmospheric Research, Boulder, CO). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0215*. 13 p. 11 refs. Contract No. NAS8-33458.

Computer and manned flight simulator studies of the effect of thunderstorm wind shear on the excitation of phugoid oscillations of commercial-type aircraft are reported. Previous studies have suggested that the characteristic scale of thunderstorm wind shear drives commercial-type aircraft at the critical phugoid frequency. To further investigate this phenomenon, aircraft performance in a hypothetical sinusoidal wind shear was investigated. Sinusoidal winds at the phugoid frequency and with frequencies above and below this value were studied both analytically and in manned flight simulators. Results indicate that excessive oscillations in flight path amplitude predicted by computer analyses were not fully collaborated by the manned flight simulator studies. Some resolution of this problem is given and additional research necessary to further identify the discrepancies between the flight simulator and the computer analysis is outlined. (Author)

A82-17855 * # **Three-dimensional flow studies on a slotted transonic wind tunnel wall.** J. M. Wu, F. G. Collins, and M. K. Bhat (Tennessee, University, Space Institute, Tullahoma, TN). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0230*. 12 p. 18 refs. Grant No. NsG-2379.

Three-dimensional flow field measurements were made near a transonic slotted wall. Field velocity vectors and static pressure distributions have been obtained. The boundary layer displacement thickness was found to vary in the transverse plane with its maximum at the slot center line but decreased with increasing suction rate through the slot. The boundary layer characteristics were sensitive to the mass transfer through the slot. The projection on the flow field velocity vectors on the transverse plane reveals a vortex-like flow formation. The center of this secondary flow was located nearly at the edge of the wall shear layer and decreased in strength with applied suction. The secondary vortex motion may be attributed to the mean flow skewing, inhomogeneous transverse plane boundary layer and the wall turbulence anisotropy. (Author)

A82-17856 * # **Vortex lift augmentation by suction on a 60 deg swept Gothic wing.** A. H. Taylor, L. R. Jackson, and J. K. Huffman (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0231*. 8 p. 12 refs.

An experimental investigation was conducted in the Langley high-speed 7- by 10-foot wind tunnel to determine the aerodynamic performance of suction applied near the wing tips above the trailing edge of a 60 deg swept Gothic wing. Movable suction inlets were symmetrically mounted in the proximity of the trailing edge, and the amount of suction was varied to maximize wing lift. Tests were conducted at Mach 0.15, 0.30, and 0.48, and the angle of attack was varied from -4 to 50 deg. The suction augmentation increases the lift coefficient over the entire range of angle of attack. The lift improvement exceeds the unaugmented wing lift by over 20%. Moreover, the augmented lift exceeds the lift predicted by vortex lattice theory to 30 deg angle of attack. Suction augmentation is postulated to strengthen the vortex system by increasing its velocity and making it more concentrated. This causes the vortex breakdown to be delayed to a higher angle of attack. (Author)

A82-17858 * # **Recent sidewall boundary-layer investigations with suction in the Langley 0.3-m Transonic Cryogenic Tunnel.** A. V. Murthy, C. B. Johnson, E. J. Ray, and P. L. Lawing (NASA, Langley Research Center, Transonic Aerodynamics Div., Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0234*. 12 p. 21 refs.

An experimental and theoretical study of the Langley 0.3-m Transonic Cryogenic Tunnel (TCT) sidewall boundary-layer with and without suction, has been made. Without suction, the boundary-layer displacement thickness at a station ahead of the model varied from about 1.6 mm to 1.3 mm over a Reynolds number range of 20 million to 200 million per m at Mach numbers from 0.30 to 0.78. Measured velocity profiles were correlated using the defect law of Hama. The boundary-layer displacement thickness decreased when suction was applied; however, after suction of about 2 percent of test section mass flow, the change in the thickness was small. A comparison of the measured suction effectiveness with finite difference and integral methods of boundary-layer calculation showed that both methods predicted the right trend over the range of suction velocities (up to a suction to free-stream velocity ratio of -0.02). (Author)

A82-17861 * # **Dynamic stability of a buoyant quad-rotor aircraft.** B. L. Nagabhushan and N. P. Tomlinson (Goodyear Aerospace Corp., Defense Systems Div., Akron, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0242*. 10 p. 13 refs. Contract No. NAS2-10777.

Stability characteristics of a buoyant quad-rotor aircraft (BQRA) in hover and forward flight are examined by considering linear, state-variable, and nonlinear flight simulation models of such a configuration. The effects of carrying a sling load on the vehicle dynamics is predicted by considering a coupled model of the two bodies. Inherent stability characteristics of the vehicle are analyzed and compared with those of a helicopter and an airship in free flight. Typical operational conditions that could lead to vehicle instability are described in the flight envelope of interest. (Author)

COMPARISON OF EXPERIMENTAL AND THEORETICAL TURBULENCE REDUCTION CHARACTERISTICS FOR SCREENS, HONEYCOMB, AND HONEYCOMB-SCREEN COMBINATIONS
James Scheiman Dec. 1981 55 p refs
(NASA-TP-1958; L-14628) Avail: NTIS HC A04/MF A01 CSCL 01A

Turbulence reduction research using screens, honeycomb, and combinations thereof was conducted in a half-scale model of a portion of the Langley 8-foot transonic pressure tunnel. It was found that screens alone reduce axial turbulence more than lateral turbulence; whereas, honeycomb alone reduces lateral turbulence more than axial turbulence. Because of this difference, the physical mechanism for decreasing turbulence for screens and honeycomb must be completely different. It is concluded that honeycomb with a downstream screen is an excellent combination for reducing turbulences. E.A.K.

A FLIGHT INVESTIGATION OF BLADE-SECTION AERODYNAMICS FOR A HELICOPTER MAIN ROTOR HAVING 10-64C AIRFOIL SECTIONS
Charles E. K. Morris, Jr. Nov. 1981 181 p refs
(NASA-TM-83226) Avail: NTIS HC A09/MF A01 CSCL 01A

Pressure data at 90 percent blade radius were obtained for a helicopter main rotor with 10-64C blade sections during flight. Concurrent measurements were made of vehicle flight state, performance and some rotor loads. The test envelope included hover, level flight from about 85 to 182 knots, climb and descent, and collective fixed maneuvers. Good agreement is shown between some sets of airfoil pressure distributions obtained in flight and those from two-dimensional wind-tunnel tests or theoretical calculations. A.R.H.

The differences in flow behavior two dimensional airfoils in the critical chordlength Reynolds number compared with lower and higher Reynolds number are discussed. The large laminar separation bubble is discussed in view of its important influence on critical Reynolds number airfoil behavior. The shortcomings of application of theoretical boundary layer computations which are successful at higher Reynolds numbers to the critical regime are discussed. The large variation in experimental aerodynamic characteristic measurement due to small changes in ambient turbulence, vibration, and sound level is illustrated. The difficulties in obtaining accurate detailed measurements in free flight and dramatic performance improvements at critical Reynolds number, achieved with various types of boundary layer tripping devices are discussed. A METHOD OF CHARACTERISTICS SOLUTION FOR A FINITE OSCILLATING SUPERSONIC CASCADE WITH THICKNESS EFFECTS
K. Vogeler *In* Ecole Polytechnique de Lausanne Aeroelasticity of Turbomachines 1981 p 333-347 refs

Avail: Issuing Activity

A method of characteristics approach to a nonlinear oscillating, supersonic cascade is presented. The method is extended to a complete cascade computation for cascades with blades of nonzero thickness on the upper and lower sides. The flow field behind a single oscillating airfoil in a supersonic flow is treated and compared with an analytical flat plate solution. The technique is merged with an existing algorithm. The performance is compared with flat plate and slender blade solutions for infinite cascades. The effect of slender blades in comparison with flat plates on the unsteady aerodynamic response of an oscillating supersonic cascade are calculated for a nonlinear cascade in both the subresonant and superresonant region. Avail: Issuing Activity

A numerical solution to a three-dimensional problem of unsteady vortex-free (in the coordinate system coupled with the cascade) flow of ideal incompressible fluid past a rotating annular cascade, based on propeller vortex and finite wing span theory, is presented. The geometry of blade edge is modeled as an annular cascade whose blades are parts of helical surfaces. Aerodynamic force calculations are given only for a large number of blades since it is essential to this method. Analysis results also show the effect of flow three-dimensionality on aerodynamic forces acting on the annular cascade blade when their number is small. Author (ESA)

THREE-DIMENSIONAL ANALYSIS OF CASCADE FLUTTER IN PARALLEL SHEAR FLOW
S. Kaji, H. Takata, and N. Niwa *In* Ecole Polytechnique de Lausanne Aeroelasticity of Turbomachines 1981 p 357-370 refs

Avail: Issuing Activity

The effect of spanwise nonuniformity of stream velocity as well as that of oscillation amplitude on flutter characteristics were studied. The main stream is assumed incompressible and to be a parallel shear flow with linear velocity profile. Flutter characteristics vary in spanwise direction in accordance with the variation of flow incidence and flow velocity. The cascade model of a semiactuator disk composed of a number of flat plate blades undergoing bending oscillation is used. It is indicated that the flow shear effect becomes noticeable in connection with oscillation modes. For uniform oscillation it is weak and for linear and quadratic modes it is significant. It is found that weak shear deteriorates aerodynamic damping and extends the unstable frequency range. Author (ESA)

THE EFFECT OF ASPECT RATIO ON THE UNSTEADY AERODYNAMIC FORCES INDUCED BY VIBRATION OF A CASCADE BLADE
J. M. R. Graham and I. Kullar *In* Ecole Polytechnique de Lausanne Aeroelasticity of Turbomachines 1981 p 371-381 refs

Avail: Issuing Activity

A correction for three dimensionality made to strip theory when calculating the aerodynamic forces due to vibration of a cascade blade in incompressible flow is discussed. The three dimensional effects arise from the spanwise variation of unsteady velocity induced at the blade by the mode of vibration. Results are presented for simple cantilever type modes of vibration, using a three dimensional unsteady cascade theory for the Fourier transform of the spanwise upwash distribution. An integral equation is formulated which is solved numerically. The integral equation is also used to derive a perturbation solution for the correction terms as a series in inverse powers of the blade aspect ratio. The effect of three dimensionality on the critical reduced frequency for torsional flutter. Author (ESA)

A flow induced vibration problem in gas turbines, the vortex whistles, is discussed. The whistle is caused by high swirl flow and its characteristics are such that the frequency of fluctuation is discrete (a pure tone). The frequency becomes higher as the swirl or flow rate increases. An incident of vortex whistle is cited. Besides dynamic behavior of the flow field, the data reveal an unexpected change in the steady or time averaged flow field when the whistle is present. It is implicated that dynamic flow can affect even the steady flow field in turbomachinery, which causes damage. Author (ESA)

IN-FLIGHT INVESTIGATION OF THE EFFECTS OF PILOT LOCATION AND CONTROL SYSTEM DESIGN ON AIRPLANE FLYING QUALITIES FOR APPROACH AND LANDING *Final Report*
Norman C. Weingarten and Charles R. Chalk Jan. 1982 215 p refs Sponsored jointly by Dryden Flight Research Facility and USAF Flight Dynamics Labs.
(Contract F33615-79-C-3618)
(NASA-CR-163115; CALSPAN-6645-F-7) Avail: NTIS HC A10/MF A01 CSCL 01C

The handling qualities of large airplanes in the approach and landing flight phase were studied. The primary variables were relative pilot position with respect to center of rotation, command path time delays and phase shifts, augmentation schemes and levels of augmentation. It is indicated that the approach and landing task with large airplanes is a low bandwidth task. Low equivalent short period frequencies and relatively long time delays are tolerated only when the pilot is located at considerable distance forward of the center of rotation. The control problem experienced by the pilots, when seated behind the center of rotation, tended to occur at low altitude when they were using visual cues of rate of sink and altitude. A direct lift controller improved final flight path control of the shuttle like configurations.

LONGITUDINAL AND LATERAL STATIC STABILITY AND CONTROL CHARACTERISTICS OF A 1/6-SCALE MODEL OF A REMOTELY PILOTED RESEARCH VEHICLE WITH A SUPERCRITICAL WING
Thomas A. Byrdsong and James B. Hallissy May 1979 118 p refs
(NASA-TP-1360; L-12059) Avail: NTIS HC A06/MF A01 CSCL 01C

An investigation was conducted in the Langley 8-foot transonic pressure tunnel to determine the longitudinal and lateral-directional static stability and control characteristics of a 1/6-scale force model of a remotely piloted research vehicle. The model was equipped with a supercritical wing and employed elevons for pitch and roll control. Test conditions were as follows: Reynolds number of about 6.6 x 10 to the 6th power per meter, variations of sideslip from -6 deg to 6 deg, elevon deflection angle (symmetrically and asymmetrically) from -8 deg to 3 deg, and rudder deflection angle from 0 deg to -10 deg. The model was longitudinally statically stable at angles of attack up to about 7 deg, which is significantly greater than the angle of attack for the cruise condition (approximately 4 deg). In the range of test Mach numbers, the model was directionally stable and had positive effective dihedral, sufficient pitch control, and positive effectiveness of roll and yaw control.

ACCELERATED DEVELOPMENT AND FLIGHT EVALUATION OF ACTIVE CONTROLS CONCEPTS FOR SUBSONIC TRANSPORT AIRCRAFT. VOLUME 1: LOAD ALLEVIATION/EXTENDED SPAN DEVELOPMENT AND FLIGHT TESTS *Final Report*
J. F. Johnston Sep. 1979 261 p refs
(Contract NAS1-14690)
(NASA-CR-159097; LR-29000-I-Vol-1) Avail: NTIS HC A12/MF A01 CSCL 01C

Active wing load alleviation to extend the wing span by 5.8 percent, giving a 3 percent reduction in cruise drag is covered. The active wing load alleviation used symmetric motions of the outboard ailerons for maneuver load control (MLC) and elastic mode suppression (EMS), and stabilizer motions for gust load alleviation (GLA). Slow maneuvers verified the MLC, and open and closed-loop flight frequency response tests verified the aircraft dynamic response to symmetric aileron and stabilizer drives as well as the active system performance. Flight tests in turbulence verified the effectiveness of the active controls in reducing gust-induced wing loads. It is concluded that active wing load alleviation/extended span is proven in the L-1011 and is ready for application to airline service; it is a very practical way to obtain the increased efficiency of a higher aspect ratio wing with minimum structural impact.

ACCELERATED DEVELOPMENT AND FLIGHT EVALUATION OF ACTIVE CONTROLS CONCEPTS FOR SUBSONIC TRANSPORT AIRCRAFT. VOLUME 2: AFT C.G. SIMULATION AND ANALYSIS *Final Report*
D. M. Urie Hampton, Va. NASA Sep. 1979 69 p
(Contract NAS1-14690)
(NASA-CR-159098; LR-29003-Vol-2) Avail: NTIS HC A05/MF A01 CSCL 01C

Relaxed static stability and stability augmentation with active controls were investigated for subsonic transport aircraft. Analytical and simulator evaluations were done using a contemporary wide body transport as a baseline. Criteria for augmentation system performance and unaugmented flying qualities were evaluated. Augmentation control laws were defined based on selected frequency response and time history criteria. Flying qualities evaluations were conducted by pilots using a moving base simulator with a transport cab. Static margin and air turbulence intensity were varied in test with and without augmentation. Suitability of a simple pitch control law was verified at neutral static margin in cruise and landing flight tasks. Neutral stability was found to be marginally acceptable in heavy turbulence in both cruise and landing conditions.

Effect of fuel injector type on performance and emissions of reverse-flow combustor
[NASA-TP-1945] N82-15040

COMBUSTION EFFICIENCY
Development and operating characteristics of an advanced two-stage combustor
[AIAA PAPER 82-0191] A82-17833

COMBUSTION PRODUCTS
Damage of turbine blades due to interaction with fuel resinification products
A82-18479

COMMERCIAL AIRCRAFT
Turboprop resurgence - The next step
A82-17149
Why safety --- fuel conservation through aircraft safety
A82-17277
Accident prevention - A regulators view
A82-17278
Estimate of human control over mid-air collisions
A82-17604
Ruggedized minicomputer hardware and software topics, 1981: Proceedings of the 4th ROLM MIL-SPEC Computer User's Group Conference
[NASA-CP-2206] N82-14829
Natural laminar flow airfoil analysis and trade studies
[NASA-CR-159029] N82-15018

COMMONALITY (EQUIPMENT)
Investigation of functional commonality of avionics systems in naval aircraft
[AD-A105503] N82-14088

COMMUNICATION NETWORKS
PLRS engineering development testing - Early results --- Position Location Reporting System with data communication network for community users in tactical environment
A82-18157
Data communications within the Air Navigation Services system
A82-18272
Modernizing the Egyptian A.T.C. system
A82-18273

COMMUNITIES
Community rotorcraft air transportation benefits and opportunities
[NASA-CR-166266] N82-16008

COMPOSITE MATERIALS
Aircraft composite materials and structures
A82-16143
Advantages and limitations in the use of diverse materials for aircraft construction --- composite versus metallic materials
[SNIAS-811-551-104] N82-15011

COMPOSITE STRUCTURES
Stress intensity factor measurements in composite sandwich structures
A82-17535
Experimental structural testing on a composite aircraft canard and its applications
[AIAA PAPER 82-0409] A82-17930

COMPRESSIBLE FLOW
Calibration of seven-hole probes suitable for high angles in subsonic compressible flows
[AIAA PAPER 82-0410] A82-17931
A contribution to the hodograph method for shock-free transonic airfoil sections
A82-18022
Computer program for aerodynamic and blading design of multistage axial-flow compressors
[NASA-TP-1946] N82-15039

COMPRESSION WAVES
Experimental investigation of a transonic potential flow around a symmetric airfoil
[NASA-TM-76676] N82-14057

COMPRESSOR BLADES
On unsteady aerodynamic forces and moments of the circular cascading blades /Experiments of the outward-flow case/
A82-16040
Design procedures for compressor blades
A82-17135
The use of optimization techniques to design controlled diffusion compressor blading
[NASA-TM-82763] N82-14094
Computer program for aerodynamic and blading design of multistage axial-flow compressors
[NASA-TP-1946] N82-15039

COMPUTATIONAL FLUID DYNAMICS
Supersonic nozzles without shocks
A82-16172
Direct approach to aerodynamic design problems
A82-16404
A summary of jet-impingement studies at McDonnell Douglas Research Laboratories
[AIAA PAPER 81-2613] A82-16904
Computation of the steady viscous flow over a tri-element 'augmentor wing' airfoil
[AIAA PAPER 82-0021] A82-17735
A simple finite difference procedure for the vortex controlled diffuser
[AIAA PAPER 82-0109] A82-17788
Computational treatment of transonic canard-wing interactions
[AIAA PAPER 82-0161] A82-17814
A more-accurate transonic computational method for wing-body configurations
[AIAA PAPER 82-0162] A82-17815
Transonic three-dimension viscous-inviscid interaction for wing-body configuration analysis
[AIAA PAPER 82-0163] A82-17816
Computations of transonic flow over an oscillating airfoil with shock-induced separation
[AIAA PAPER 82-0350] A82-17900
Viscous flow - Nemesis of the theoretician in pursuit of higher order accuracy
[AIAA PAPER 82-0389] A82-17919
Responses of oscillating wings in weak shear flow
A82-18021
A contribution to the hodograph method for shock-free transonic airfoil sections
A82-18022
Experimental investigation of a transonic potential flow around a symmetric airfoil
[NASA-TM-76676] N82-14057
Aeroelasticity in turbomachines --- conference proceedings
[EPFL-ITA-10] N82-15042
Aerodynamic response of a blade in pitching oscillation with partial and full separation --- measurement of the instantaneous pressure distribution around a vibrating blade surface in a wind tunnel
N82-15047
Calculation of quasi-stationary aerodynamic force acting on a cascade of oscillating airfoils in subsonic flow
N82-15051

Numerical experiments on unsteady flows through vibrating cascades
N82-15052

Computer aided investigation of turbomachine aerodynamics and aeroelasticity
N82-15053

A method for force determination from vibration response measurements --- application to turbomachine blades
N82-15055

COMPUTER COMPONENTS
A prototype interface unit for microprocessor based Loran-C receiver
[NASA-CR-164887] N82-14078

COMPUTER GRAPHICS
A prototype interface unit for microprocessor based Loran-C receiver
[NASA-CR-164887] N82-14078
Interactive-graphic flowpath plotting for turbine engines
[NASA-TM-82756] N82-15041

COMPUTER PROGRAMS
The application of programmable pocket calculators for computations during survey flights
A82-16164

Transonic three-dimension viscous-inviscid interaction for wing-body configuration analysis
[AIAA PAPER 82-0163] A82-17816
Numerical computation of optimal atmospheric trajectories involving staged vehicles
[AIAA PAPER 82-0360] A82-17902
'Integral Noise': An automatic calculation model for the prediction and control of fixed-wing aircraft noise. I - General considerations, theoretical bases and model analysis
A82-18274

Analysis of two air traffic samples in the terminal area of Frankfurt/Main, August 4th 1978
[DFVLR-MITT-81-12] N82-14073

COMPUTER STORAGE DEVICES
Ruggedized minicomputer hardware and software topics, 1981: Proceedings of the 4th ROLM MIL-SPEC Computer User's Group Conference
[NASA-CP-2206] N82-14829

COMPUTER SYSTEMS PROGRAMS
Real time simulation of computer-assisted sequencing of terminal area operations
[NASA-CR-166195] N82-14817
Airborne data analysis/monitor system
N82-14830

Development of Integrated Programs for Aerospace-Vehicle Design (IPAD) - IPAD user requirements
[NASA-CR-2985] N82-15034

COMPUTER TECHNIQUES
VOR waveform synthesis and calibration
A82-16563

Air traffic control problems and solutions
A82-17283

Flight crew management and cockpit performance systems
A82-17285

Computer flight planning for fuel efficiency
A82-17289

The NASA MERIT program - Developing new concepts for accurate flight planning
[AIAA PAPER 82-0340] A82-17894

COMPUTERIZED DESIGN
An aerodynamic and signature shaping technique for developing advanced supersonic missile concepts
[AIAA PAPER 82-0373] A82-17912
Modeling and Analysis of Power Processing Systems (MAPPS). Volume 1: Technical report
[NASA-CR-165538] N82-14447
High lift selected concepts
[NASA-CR-159093] N82-15017
Computer program for aerodynamic and blading design of multistage axial-flow compressors
[NASA-TP-1946] N82-15039
Interactive-graphic flowpath plotting for turbine engines
[NASA-TM-82756] N82-15041

COMPUTERIZED SIMULATION
Computation of the steady viscous flow over a tri-element 'augmentor wing' airfoil
[AIAA PAPER 82-0021] A82-17735
A simple finite difference procedure for the vortex controlled diffuser
[AIAA PAPER 82-0109] A82-17788

Computational treatment of transonic canard-wing interactions
[AIAA PAPER 82-0161] A82-17814
Simulation of phugoid excitation due to hazardous wind shear
[AIAA PAPER 82-0215] A82-17844
Digital test pilot concept
[AIAA PAPER 82-0259] A82-17867
The influence of turbulence models on computer-simulated aircraft landing
[AIAA PAPER 82-0342] A82-17896
JTIDS RELNAV network off-line simulation
A82-18153

The electromagnetic theta gun and tubular projectiles
A82-18182

'Integral Noise': An automatic calculation model for the prediction and control of fixed-wing aircraft noise. I - General considerations, theoretical bases and model analysis
A82-18274

Real time simulation of computer-assisted sequencing of terminal area operations
[NASA-CR-166195] N82-14817
On-board computer progress in development of A 310 flight testing program
N82-14833

CONFERENCES
Safe and efficient management of energy; Proceedings of the Thirty-third Annual International Air Safety Seminar, Christchurch, New Zealand, September 15-18, 1980
A82-17276

PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record
A82-18126

Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, North Carolina State University, Raleigh, NC, June 8-10, 1981
A82-18726

Ruggedized minicomputer hardware and software topics, 1981: Proceedings of the 4th ROLM MIL-SPEC Computer User's Group Conference
[NASA-CP-2206] N82-14829
Aeroelasticity in turbomachines --- conference proceedings
[EPFL-ITA-10] N82-15042
Technical evaluation report on the Aeroelasticity in Turbomachines Symposium
N82-15070

Optical Information Processing for Aerospace Applications
[NASA-CP-2207] N82-15094

CONFIGURATION MANAGEMENT
The shape of the air traffic control system of the future - A U.S. perspective
A82-17280

CONTRACT MANAGEMENT
Trends in maintainability and reliability of avionics systems with particular reference to DCAD Technical Publication 1/77
A82-16561

CONTROL
Control of vibration in aeroelastic cascade experiments
N82-15056

CONTROL CONFIGURED VEHICLES
Flight mechanics - Modern aircraft design and control concepts --- German book
A82-17951

CONTROL SIMULATION
Real-time simulation of helicopter IFR approaches into major terminal areas using RNAV, MLS, and CDTI
[AIAA PAPER 82-0260] A82-17868
A general aviation simulator evaluation of a rate-enhanced instrument landing system display
[NASA-TP-1960] N82-14085

CONTROL STABILITY
Flutter mode suppression using hyperstable feedback
[AIAA PAPER 82-0368] A82-17906
In-flight investigation of the effects of pilot location and control system design on airplane flying qualities for approach and landing
[NASA-CR-163115] N82-15074

MLS - A new generation landing guidance system is here A82-18145

The DME-based Azimuth System /DAS/ A82-18146

Helicopter decelerated steep approach and landing to confined areas under instrument meteorological conditions A82-18161

MLS vertical guidance and navigation for a STOL airplane landing on an elevated STOLport [NASA-TM-81338] N82-14101

MIDAIR COLLISIONS
Estimate of human control over mid-air collisions A82-17604

MILITARY AIR FACILITIES
Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 1: Color measurements [IZF-1980-1-VOL-1] N82-15081
Optical properties of airfield lighting fixtures of the Royal Netherlands Airforce. Part 2: Intensity measurements [IZF-1980-12-VOL-2] N82-15082

MILITARY AIRCRAFT
Head-up displays - The integrity of flight information A82-16562

Type 'A' V/STOL - One aircraft for all support missions [AIAA PAPER 81-2661] A82-16917
The application of bifurcation theory to the study of loss of control over combat aircraft [ONERA, TP NO. 1981-100] A82-18837
Investigation of functional commonality of avionics systems in naval aircraft [AD-A105503] N82-14088

MILITARY TECHNOLOGY
A low cost maritime control aircraft-ship-weapons system --- antiship missile defense [AIAA PAPER 81-2660] A82-16916
PLRS engineering development testing - Early results --- Position Location Reporting System with data communication network for community users in tactical environment A82-18157

MISSILE CONFIGURATIONS
Aerodynamics of tactical weapons to Mach number 8 and angle-of-attack of 180 deg [AIAA PAPER 82-0250] A82-17864
Performance considerations in the design of subsonic cruise missiles [AIAA PAPER 82-0371] A82-17911
An aerodynamic and signature shaping technique for developing advanced supersonic missile concepts [AIAA PAPER 82-0373] A82-17912
Evaluation of supersonic missile aerodynamic prediction techniques [AIAA PAPER 82-0390] A82-17920

MISSILE CONTROL
Target acceleration modeling for tactical missile guidance [AIAA PAPER 82-0370] A82-17910

MISSILE DEFENSE
Performance considerations in the design of subsonic cruise missiles [AIAA PAPER 82-0371] A82-17911

MISSILE DESIGN
Performance considerations in the design of subsonic cruise missiles [AIAA PAPER 82-0371] A82-17911
An aerodynamic and signature shaping technique for developing advanced supersonic missile concepts [AIAA PAPER 82-0373] A82-17912
Evaluation of supersonic missile aerodynamic prediction techniques [AIAA PAPER 82-0390] A82-17920

MISSILE SIGNATURES
An aerodynamic and signature shaping technique for developing advanced supersonic missile concepts [AIAA PAPER 82-0373] A82-17912

MISSILES
Viscous flow - Nemesis of the theoretician in pursuit of higher order accuracy [AIAA PAPER 82-0389] A82-17919

MISSION PLANNING
Type 'A' V/STOL - One aircraft for all support missions [AIAA PAPER 81-2661] A82-16917

MODULATION TRANSFER FUNCTION
The Modular Automated Weather System (MAWS) concept --- airfield weather support N82-14763

MOISTURE CONTENT
Water ingestion into jet engine axial compressors [AIAA PAPER 82-0196] A82-17836

MOMENTS OF INERTIA
A method for measuring takeoff and landing performance of aircraft, using an inertial sensing system [NLR-MP-80036-U] N82-14084

MRCA AIRCRAFT
A high strength ejector release unit for the Tornado A82-16025

MULTIPHASE FLOW
Infrared emissions from turbofans with high aspect ratio nozzles A82-16092

N

NACELLES
J58/SR-71 propulsion integration or the great adventure into the technical unknown A82-17418

NASA PROGRAMS
NASA V/STOL Propulsion Control Analysis - Phase I and II program status [AIAA PAPER 81-2632] A82-16908
Index to NASA News Releases and Speeches, 1980 N82-15985

NATIONAL AVIATION SYSTEM
Modernizing the Egyptian A.T.C. system A82-18273

NAVIER-STOKES EQUATION
A simple finite difference procedure for the vortex controlled diffuser [AIAA PAPER 82-0109] A82-17788
Relaxation solution for viscous transonic flow about fighter-type forebodies and afterbodies [AIAA PAPER 82-0252] A82-17865
ACTA Mechanica Sinica (selected articles) [AD-A107322] N82-14060

NAVIGATION AIDS
The application of programmable pocket calculators for computations during survey flights A82-16164

PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record A82-18126

Selecting the post 1990 civil aviation radionavigation system A82-18141

Solid-state VORTAC with remote maintenance and monitoring A82-18144

Flight measurements of Area Navigation System performance using various combinations of ground aids and airborne sensors A82-18147

Evaluation of Loran-C enroute navigation and non-precision approaches within the State of Vermont A82-18160

NAVSTAR SATELLITES
NAVSTAR Global Positioning System A82-17310

Navigation system integrity and reliability for civil aviation A82-18159

Enhanced noise immunity and error control in a fully integrated JTIDS/GPS receiver --- Joint Tactical Information Distribution System A82-18171

NAVY
Investigation of functional commonality of avionics systems in naval aircraft [AD-A105503] N82-14088

NICKEL ALLOYS
Damage of turbine blades due to interaction with fuel resinification products A82-18479

NOISE GENERATORS
- Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, North Carolina State University, Raleigh, NC, June 8-10, 1981 A82-18726

NOISE INTENSITY
- Quantification of airport community noise impact in terms of noise levels, population density, and human subjective response A82-18732

NOISE MEASUREMENT
- Noise control measures in the new Singapore International Airport A82-16746
- The effect of non-linear propagation in jet noise [AIAA PAPER 82-0416] A82-17936
- Noise monitoring in airport communities A82-18731

NOISE POLLUTION
- Noise monitoring in airport communities A82-18731
- Quantification of airport community noise impact in terms of noise levels, population density, and human subjective response A82-18732
- Effects of aircraft noise on the equilibrium of airport residents: Supplementary analyses to the study carried out around Orly [NASA-TM-76627] N82-14673
- Taking into account nighttime annoyance in the calculation of the psophic index [NASA-TM-76580] N82-14674

NOISE PREDICTION
- An iterative finite element-integral technique for predicting sound radiation from turbofan inlets in steady flight [AIAA PAPER 82-0124] A82-17796

NOISE PREDICTION (AIRCRAFT)
- 'Integral Noise': An automatic calculation model for the prediction and control of fixed-wing aircraft noise. I - General considerations, theoretical bases and model analysis A82-18274

NOISE PROPAGATION
- The effect of non-linear propagation in jet noise [AIAA PAPER 82-0416] A82-17936

NOISE REDUCTION
- Noise control measures in the new Singapore International Airport A82-16746
- Current investigations regarding noise research in the Braunschweig Center of the German Institute for Research and Experimentation in Aeronautics and Astronautics A82-17137
- Screech suppression in supersonic jets [AIAA PAPER 82-0050] A82-17753
- Enhanced noise immunity and error control in a fully integrated JTIDS/GPS receiver --- Joint Tactical Information Distribution System A82-18171
- 'Integral Noise': An automatic calculation model for the prediction and control of fixed-wing aircraft noise. I - General considerations, theoretical bases and model analysis A82-18274
- Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, North Carolina State University, Raleigh, NC, June 8-10, 1981 A82-18726
- Reduction of the acoustic environment in an F100-PW-100 engine test cell A82-18727
- Development of a transmission loss test facility for light aircraft structures A82-18728
- Noise control plan for a new airplane manufacturing facility A82-18730

NOISE SPECTRA
- Prediction of flyover jet noise spectra from static tests [NASA-TM-83219] N82-14880

NONDESTRUCTIVE TESTS
- Inclusions and service induced cracks in a mature population of gas turbine engine bearings [ASME PAPER 81-LUB-48] A82-18444
- Control methodology: Nondestructive testing in the aeronautics industry [SNIAS-812-551-110] N82-14527

NONLINEARITY
- Linear and nonlinear analysis of vortex whistle: Another blade buster N82-15067

NONUNIFORM FLOW
- Recent improvements in prediction techniques for supersonic weapon separation [AIAA PAPER 82-0170] A82-17820

NOZZLE DESIGN
- Ground test of a large scale 'D' vented thrust deflecting nozzle [AIAA PAPER 81-2630] A82-16907
- Development and operating characteristics of an advanced two-stage combustor [AIAA PAPER 82-0191] A82-17833

NOZZLE FLOW
- Supersonic nozzles without shocks A82-16172
- ADEN plume flow properties for infrared analysis --- Augmented Deflecting Exhaust Nozzle A82-17606

NOZZLE GEOMETRY
- A summary of V/STOL inlet analysis methods [AIAA PAPER 81-2628] A82-16902
- Ground test of a large scale 'D' vented thrust deflecting nozzle [AIAA PAPER 81-2630] A82-16907
- Screech suppression in supersonic jets [AIAA PAPER 82-0050] A82-17753

NOZZLES
- Development of improved high temperature coatings for IN-792 + HF [NASA-CR-165395] N82-14333

NUMERICAL ANALYSIS
- Numerical computation of optimal atmospheric trajectories involving staged vehicles [AIAA PAPER 82-0360] A82-17902
- Lifting surface theory for wings in low frequency small amplitude yawing and side slipping oscillating motions at low speeds N82-14061

NUMERICAL CONTROL
- The Modular Automated Weather System (MAWS) concept --- airfield weather support N82-14763

NUMERICAL INTEGRATION
- Application of integration algorithms in a parallel processing environment for the simulation of jet engines [NASA-TM-82746] N82-14849

O

OBSTACLE AVOIDANCE
- Techniques for overhead-wire detection --- to prevent helicopter wirestrikes A82-16560

OIL ADDITIVES
- Corrosion inhibiting engine oils [AD-A106127] N82-14099

OIL POLLUTION
- Pollution of the soil by aviation gasoline [PSL-1979-41] N82-15596

OMEGA NAVIGATION SYSTEM
- Results of a Differential Omega experiment A82-18094

ONBOARD DATA PROCESSING
- Ruggedized minicomputer hardware and software topics, 1981: Proceedings of the 4th ROLM MIL-SPEC Computer User's Group Conference [NASA-CP-2206] N82-14829
- airborne data analysis/monitor system N82-14830
- ADAMS executive and operating system N82-14831
- On-board computer progress in development of A 310 flight testing program N82-14833

ONBOARD EQUIPMENT
- 3 DOF gyro analysis from measured and derived rates --- hypersonic reentry simulation test [AIAA PAPER 82-0189] A82-17831
- Helicopter model studies for on-board electrostatic sensors [AD-A105511] N82-14089

Research on an induction driven cryogenic wind tunnel
N82-14394

WIND TUNNEL TESTS
Grumman Tomcat - In a class of its own
A82-16800
Advanced technology airfoil development for the XV-15 tilt-rotor vehicle
[AIAA PAPER 81-2623] A82-16906
The German-Dutch wind tunnel as aeroacoustic experimental installation
A82-17136
Effect on surface pressures of trapezoidal holes in a T-38 stabilator
A82-17602
Propeller tip vortex - A possible contributor to aircraft cabin noise
A82-17603
Wind tunnel investigations for the flat spin of slender bodies at high angles of attack
[AIAA PAPER 82-0054] A82-17755
Trailing edge flap influence on leading edge vortex flap aerodynamics
[AIAA PAPER 82-0128] A82-17799
An experimental investigation of the influence of vertical wind shear on the aerodynamic characteristics of an airfoil
[AIAA PAPER 82-0214] A82-17843
Vortex lift augmentation by suction on a 60 deg swept Gothic wing
[AIAA PAPER 82-0231] A82-17856
Wind tunnel tests of engine-equipped models: Comparison of two jet wash simulation methods
[NASA-TM-76764] N82-14091
Relations for the thermodynamic and transport properties in the testing environment of the Langley hypersonic CF4 tunnel
[NASA-TM-83220] N82-15359

WIND TUNNEL WALLS
Three-dimensional flow studies on a slotted transonic wind tunnel wall
[AIAA PAPER 82-0230] A82-17855

WIND TUNNELS
La Recherche Aerospatiale, Bi-monthly Bulletin No. 1981-2, March - April 1981 --- aerodynamic research
[ESA-TT-713] N82-14388

WING LOADING
Investigation of the stress-strain state of a rectangular wing section of variable thickness under concentrated loads and heating
A82-18588
Development of an efficient procedure for calculating the aerodynamic effects of planform variation
[NASA-CR-3489] N82-14529
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15076

WING OSCILLATIONS
A method for locating aircraft wing damage by nonlinear vibration analysis
A82-17116
Instantaneous turbulence profiles in the wake of an oscillating airfoil
[AIAA PAPER 82-0353] A82-17901
Responses of oscillating wings in weak shear flow
A82-18021
Torsional vibrations of a wing carrying a concentrated load /asymptotic behavior/
A82-18620
Lifting surface theory for wings in low frequency small amplitude yawing and side slipping oscillating motions at low speeds
N82-14061
A theoretical investigation of wing rocking
[NASA-CR-165058] N82-15031

WING PANELS
Multilevel optimum design of structures with fiber-composite stiffened-panel components
[AIAA PAPER 80-0723] A82-17594
Development of an efficient procedure for calculating the aerodynamic effects of planform variation
[NASA-CR-3489] N82-14529

WING PLANFORMS
Development of an efficient procedure for calculating the aerodynamic effects of planform variation
[NASA-CR-3489] N82-14529

WING PROFILES
Determination of the trimmed drag of an aircraft
A82-18583

WING SLOTS
Computation of the steady viscous flow over a tri-element 'augmentor wing' airfoil
[AIAA PAPER 82-0021] A82-17735

WING SPAN
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15076

WING TIP VORTICES
Vortex lift augmentation by suction on a 60 deg swept Gothic wing
[AIAA PAPER 82-0231] A82-17856

WING TIPS
Optimization and performance calculation of dual-rotation propellers
[NASA-TP-1948] N82-14049

WIRE
Techniques for overhead-wire detection --- to prevent helicopter wirestrikes
A82-16560

WORKLOADS (PSYCHOPHYSIOLOGY)
Electronic master monitor and advisory display system, operational fuctions report
[AD-A105516] N82-14087

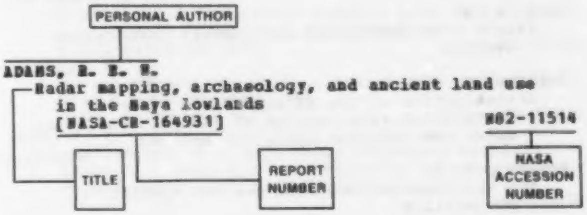
X

XV-15 AIRCRAFT
Advanced technology airfoil development for the XV-15 tilt-rotor vehicle
[AIAA PAPER 81-2623] A82-16906

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING / *A Continuing Bibliography (Suppl. 147)* **APRIL 1982**

Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

A

ABLA, M. H.
Determination of Learjet Longhorn airplane horizontal tail load and hinge moment characteristics from flight data
[AIAA PAPER 82-0183] A82-17827

ABRAMS, L. E.
Results of a Differential Omega experiment
A82-18094

ADACHI, T.
On the numerical analysis of stall flutter in turbine cascades

years, of nine piston and eight turbofan and turbojet engines as installed in 22 different transport aircraft. Attention is given to the contribution of engine design to improvements in overall aircraft performance, as highlighted by such contrasting figures as (1) the 600-800 hour overhaul periods considered acceptable during the Second World War and the 10,000-hour periods typical of present transport aircraft, and (2) the 150 mph speeds and 2400-mile ranges of 84,000-lb aircraft carrying 20 passengers by comparison to 550 mph, 4500-mile range figures for 800,000-lb aircraft carrying 450 passengers. Performance figures are given for engines representative of the state-of-the-art at pivotal points of engine and airframe design development. O.C.

A82-16147 **Digital active control system for load alleviation for the Lockheed L-1011.** G. E. Bendixen (Rockwell International Corp., Cedar Rapids, IA), R. F. O'Connell, and C. D. Siegert (Lockheed-California Co., Burbank, CA). *Aeronautical Journal*, vol. 85, Nov. 1981, p. 430-436. 5 refs.

A digital active control system (ACS) is described which is used to reduce maneuver and gust loads in the extended-wing L-1011 TriStar, permitting improved aircraft performance with minimal wing structure changes. Reliability requirements aimed at high system availability are satisfied by means of a dual-dual, fail operational system architecture in which each of the two ACS computers contains two digital processors. The digital computer provides for control of the aileron servos, self-test capability and redundancy management. Attention is given the compatibility of automatic and primary flight control systems, the digital sensor data transfer functions of the ACS computer and its Algol-like software configuration, redundancy management, and servo and computer monitoring. O.C.

A82-16148 **Scattering of sound by a vortex ring.** T. Kambe and U. M. Oo (Kyushu University, Fukuoka, Japan). *Physical Society of Japan, Journal*, vol. 50, Oct. 1981, p. 3507-3516. 13 refs.

The scattering of a plane acoustic wave by a vortex ring is analyzed in terms of the Lighthill theory of aerodynamic sound generation. A formula for the scattered pressure is obtained from the term representing the interaction of the sound wave with the flow in the source terms of the inhomogeneous wave equation, and is applied to the case of scattering by a circular vortex ring in translational motion. Scattering amplitudes and cross sections are evaluated numerically for the case of slow motion. The total scattering cross section is found to depend not only on the wavelengths of the incident wave, but on the Mach number and direction of a vortex motion. A comparison reveals the scattering power of the vortex ring to be small in relation to that of a solid sphere of the same size. S.C.S.

A82-16153 **Effect of fleet size on estimates of safety against airframe fatigue (Vliv velikosti flotily na odhad unavove spolehlivosti draku letounu).** V. Nejedly. *Zpravodaj VZLU*, no. 3, 1981, p. 111-126. 22 refs. In Czech.

A method is proposed for determining the effect of fleet size on the values of safety coefficients used for aircraft service life estimation. The proposed theoretical solution is based on a statistical analysis of the fatigue damage sequence. Results are presented in a graphical form convenient for practical applications. V.L.

A82-16164 **The application of programmable pocket calculators for computations during survey flights.** H. C. Zorn (International Institute for Aerial Survey and Earth Sciences, Enschede, Netherlands). *ITC Journal*, no. 3, 1981, p. 308-333.

Computation during survey flights can be effectively achieved using a programmable pocket calculator such as the Hewett-Packard C41 model. Using this calculator, formulas and programs have been developed for computing survey turns; wind star; heading and ground speed, given wind vector and required course; pressure altitude required to reach required true altitude, and true airspeed given indicated airspeed, air temperature, and pressure altitude. Other potential applications include the conversion of latitude and longitude to UTM zone and coordinates, and great circle and loxodrome computations. S.C.S.

A82-16172 **Supersonic nozzles without shocks.** M. Burnat (Warszawa, Uniwersytet, Warsaw, Poland). *Archiwum Mechaniki Stosowanej*, vol. 33, no. 1, 1981, p. 117-132. 7 refs.

The Busemann hodograph technique is extended to three-dimensional flows of ideal gases. By using the proposed method of Bernoulli manifolds, it is shown that there exists a wide class of nozzles which transform one uniform supersonic flow into another one without shock. The present analysis can provide a basis for a numerical method aimed at constructing nozzles with specified characteristics. V.L.

A82-16174 **Improvement of the first-ply-failure strength in laminates by using softening strips.** C. T. Sun (Purdue University, West Lafayette, IN) and P. M. Voit. *Composites Technology Review*, vol. 3, Fall 1981, p. 109-113. U.S. Department of Transportation Contract No. RC-92004.

Results of a study of softening strips for various laminates are reported. Baseline systems, all graphite/epoxy laminates, were subjected to stress analysis by means of a finite element program using equivalent elastic constants, with a maximum stress criterion of the first ply failure. Softening strips were added and the tests were repeated. The strip reduced the stress concentration in notched laminated composites and increased the load carrying capability for the first ply failure. It is noted that stresses in individual plies must be calculated to determine the ply failure strength, and also that the width of the softening strip significantly affects the load-carrying capability of laminates. The results are applicable to aircraft structures with fastener holes subject to stress concentrations. M.S.K.

A82-16178 **The Federal Radionavigation Plan.** W. K. Mey (U.S. Coast Guard, Washington, DC). *(Institute of Navigation, Annual Meeting, Annapolis, MD, June 9-11, 1981.) Navigation*, vol. 28, Fall 1981, p. 231-246.

Policies and plans for the U.S. radionavigation services which are delineated by the Federal Radionavigation Plan are described. Areas of authority and responsibility as well as management structure for defining cost requirements and cost-effective operation are provided, along with various navigation phases and current and future requirements for each phase. Federally operated systems with a high degree of common use, both military and civil, including Loran-A, Loran-B, Omega, VOR, VOR/DME, VORTAC, TACAN, ILS, TRANSIT, MLS, Radiobeacons, and the Navstar GPS are examined for a suitable mix to satisfy user requirements. A preliminary recommendation for the future navigation mix will be issued by the DOD/DOT in 1983, and a decision at the national level will be forthcoming in 1986. It is noted that maritime navigation is tending toward a minimum number of systems, while aviation has witnessed heavy investments in VOR/DME. M.S.K.

A82-16187 **Determination of the flammability characteristics of aerospace hydraulic fluids.** C. E. Snyder, Jr. (USAF, Materials Laboratory, Wright-Patterson AFB, OH), A. A. Krawetz, and T. Tovrog (Phoenix Chemical Laboratory, Inc., Chicago, IL). *(American Society of Lubrication Engineers, Annual Meeting, 35th, Anaheim, CA, May 5-8, 1980.) Lubrication Engineering*, vol. 37, Dec. 1981, p. 705-713; Discussion, p. 713, 714.

The hazards associated with the flammability characteristics of aerospace hydraulic fluids are well known. In an effort to reduce these hazards, commercial airlines converted to the use of a phosphate-ester-based, fire-resistant hydraulic fluid with the advent of jet aircraft in the early 1950s. More recently, some of the military aircraft were converted to a compatible, synthetic-hydrocarbon-based hydraulic fluid for the same reason. The flammability characteristics of these and other aerospace hydraulic fluids and test methods used to determine them are discussed. Since a deficiency exists in the area of determination of the flame and/or fire-propagation characteristics of fluids and lubricants, a new test method was developed and is described. The degree of correlation of the data from this test method with other flammability tests is discussed. (Author)

A82-16267 † **An experimental study of the combustion of liquid hydrocarbon fuel sprayed into a diffusion hydrogen-air jet (Eksperimental'noe issledovanie goreniia zhidkogo uglevodorodnogo topliva raspylennogo v diffuzionnom vodorodno-vozdushnom fakele).** Iu. M. Annushkin and G. F. Maslov. *Fizika Goreniia i Vzryva*, vol. 17, Sept.-Oct. 1981, p. 34-38. 7 refs. In Russian.

Simultaneous combustion of liquid hydrocarbon fuel and gaseous hydrogen has been investigated experimentally using a coaxial jet placed in an air stream along the central axis of a subsonic wind tunnel of 160 mm diameter. It is shown that when the liquid fuel is sprayed into the stream, stable combustion with moderate flame lengths is achieved in a high-velocity air stream even at low hydrogen concentrations. V.L.

A82-16289 † **Mechanism for the elimination of instability in a shimmy problem (Mekhanizm ustraneniia neustoichivosti v zadache o shimmi).** L. G. Lobas and N. V. Nikitina (Akademiia Nauk Ukrainskoi SSR, Institut Mekhaniki, Kiev, Ukrainian SSR). *Matematicheskaia Fizika*, no. 30, 1981, p. 24-28. In Russian.

A theoretical study is presented of a square-law damper suitable for reducing the shimmy of a landing gear strut. Numerical integration shows that the square-law damper leads to the stabilization of self-oscillations, which are then reduced by dry friction. B.J.

A82-16290 † **Self-oscillations of the front caster wheel strut for a given track width under the assumption of the wheel drift hypothesis (Avtokolebaniia orientiruiushcheisia stoiki shassi pri zadannoi vysote kolesa v predpolozhenii gipotezy uvoda).** L. G. Lobas (Akademiia Nauk Ukrainskoi SSR, Institut Mekhaniki, Kiev, Ukrainian SSR). *Matematicheskaia Fizika*, no. 30, 1981, p. 28-34. In Russian.

A theoretical analysis of the self-oscillations of a front caster wheel strut is presented. The dependence of the limit-cycle amplitude on the characteristics of a square-law damper connected in parallel to the elastic element is determined. Numerical results are presented on the occurrence of self-oscillations at velocities above the critical one. B.J.

A82-16335 **FILE-IB aircraft flight test program.** H. M. Thomas (Martin Marietta Aerospace, Denver, CO). In: Guidance and control 1981; Proceedings of the Annual Rocky Mountain Guidance and Control Conference, Keystone, CO, January 31-February 4, 1981. San Diego, CA, Univelt, Inc., 1981, p. 363-378. 5 refs. (AAS 81-041)

The Feature Identification and Location Experiment (FILE-IB) is an earth observation experiment, which was successfully flown on the NASA CV-990 aircraft. The FILE-IB classifies earth scenes into four categories: water, bare land, vegetation, and cloud/snow. The FILE system consists of three major elements: electronics for experiments control, sensors to provide multispectral image data, and a buffer memory and magnetic tape recorder for data storage. The sensors have two silicon-charged coupled device television cameras, one for the 650 nanometer (VR) band, and the other for the 850 nanometer (NIR) band. The data, obtained during eight flight missions over low altitude regions of the U.S. west coast, were analyzed on both a micro and a macro scale: the micro scale analysis, which concentrates on individual scenes, identifies specific classification problems; the macro scale analysis, operating on the statistics for the population of all the scenes, ensures that the algorithm performs well over a variety of scenes. J.F.

A82-16404 # **Direct approach to aerodynamic design problems.** W. C. Chin. *ASME, Transactions, Journal of Applied Mechanics*, vol. 48, Dec. 1981, p. 721-728. 11 refs.

'Direct' small disturbance approaches to inviscid aerodynamic 'inverse' or 'design' problems in two- and three-dimensional subsonic, supersonic, and transonic flow are presented which extend the stream function method of Chin and Rizzetta (1979). The shape solutions generally involve nonlinear differential equations of mixed type for scalar 'streamlike' functions. Dualities relating the analysis problem for camber to the design problem for thickness and the design problem for camber to the analysis problem for thickness are given for planar flow; both closed trailing edges and cusped ones, which are generally opened and which model the displacement effects of viscous wakes, are treated. C.R.

A82-16417 # **Resonant whirling of aircraft propeller-engine systems.** S. H. Crandall and J. Dugundji (MIT, Cambridge, MA). *ASME, Transactions, Journal of Applied Mechanics*, vol. 48, Dec. 1981, p. 929-935. 8 refs.

At a critical speed, a light aircraft can experience severe vibrations in steady flight in which the propeller blades vibrate at one frequency while the engine block vibrates at a lower frequency. A model is presented which explains this phenomenon. A three-bladed propeller-engine system is considered to have six rigid-body degrees of freedom plus six blade vibration degrees of freedom. This system is analyzed and simplified by introducing a constraint based on observation of the flight phenomenon. Multiblade coordinates are introduced and a linear eigenvalue problem is derived which describes whirling motions of the engine coupled to progressive waves of blade deformation which circle the propeller disk. These whirling motions are excited by harmonics of the transverse forces on the engine due to the explosion gas pressures in the cylinders. The effects of varying the propeller blade pitch angle are studied and a high-speed instability mechanism is examined. (Author)

A82-16428 # **Cavitation inception in spool valves.** C. S. Martin (Georgia Institute of Technology, Atlanta, GA), H. Medlarz (Karlsruhe, Universitaet, Karlsruhe, West Germany), D. C. Wiggert (Michigan State University, East Lansing, MI), and C. Brennen (California Institute of Technology, Pasadena, CA). *ASME, Transactions, Journal of Fluids Engineering*, vol. 103, Dec. 1981, p. 564-575; Discussion, p. 575, 576. 40 refs. Contract No. F33615-77-C-2036.

Cavitation has been investigated in directional control valves in order to identify damage mechanisms characteristic of components of aircraft hydraulic systems. Tests have been conducted in a representative metal spool valve and in a model three times larger. Data taken under noncavitating conditions with both valves showed that the position of the high-velocity annular jet shifts orientation, depending upon valve opening and Reynolds number. By means of high-frequency response pressure transducers strategically placed in the valve chamber cavitation could be sensed by the correlation of noise with a cavitation index. The onset of cavitation can be detected by comparing energy spectra for a fixed valve opening and a constant discharge. Another sensitive indicator of cavitation inception is the ratio of cavitating to noncavitating spectral densities. The incipient cavitation number as defined in this investigation is correlated with the Reynolds number for both valves. (Author)

A82-16432 # **Aerodynamic effects of shape, camber, pitch, and ground proximity on idealized ground-vehicle bodies.** A. R. George (Cornell University, Ithaca, NY). *ASME, Transactions, Journal of Fluids Engineering*, vol. 103, Dec. 1981, p. 631-637; Discussion, p. 637, 638. 17 refs.

A82-[illegible] **Applications for hypersonic Waverider spacecraft.** D. Lunan. *British Interplanetary Society, Journal (Space Chronicle)*, vol. 35, Jan. 1982, p. 46-47. 11 refs.

The use of the Waverider concept for an atmospheric entry vehicle is discussed. The Waverider has a flat upper surface, a straight leading edge, and anhedral 'V' shaped wings. Entering an atmosphere at near-orbital speed, the craft would fly with nose-up at a high angle of incidence, riding a plasma shock wave, heating to an equilibrium temperature of 1500 C, and offer the opportunity for a low-speed landing at a wider choice of sites than the Shuttle. The flat upper surface protects against radio black-out and can be used as a platform for planetary exploration instruments. Martian aerographic, and Venus and Jupiter missions are examined, noting that the Waverider would probably never land on Venus and Jupiter due to its aerodynamic characteristics and the densities and wind speeds of the two planets' atmospheres. The use of mass-driver launched Waveriders to deliver raw materials directly from the moon to earth is also explored. D.H.K.

A82-16527 **Management of a large avionics project.** H. R. Sandilands (Marconi Avionics, Ltd., Hemel Hempstead, Herts., England) and B. Taylor (Marconi Avionics, Ltd., St. Albans, Herts., England). *IEE Proceedings, Part F - Communications, Radar and Signal Processing*, vol. 128, pt. F, no. 7, Dec. 1981, p. 408-411.

The management of a major avionics project is discussed, using as an example the Airborne Early Warning Nimrod Mission System Avionics project, sponsored by the UK Ministry of Defence. A multilayer project family tree is outlined; the family tree structure is the basis for the identification and interrelation of all the elemental and incremental tasks which must be performed to implement the project. It serves to allocate managerial responsibility for conduct and achievement on a direct, one-to-one basis. It is fundamental to all management and control activities, such as cost and timescale estimation and attribution, preparation of program networks, identification of milestones and key events, allocation of resources high angles of attack subject to finite-amplitude disturbances in pitch is studied using bifurcation theory, taking account of the interactions between the pitching motion and the unsteady flow. The aerodynamic responses to large-amplitude slow oscillations of the aircraft are obtained from that of infinitesimal amplitude case. Increasing the angle of attack past some critical angle for which the damping vanishes, the steady flight becomes unstable and Hopf bifurcation sets in, resulting in a periodic motion. A simple criterion in terms of the aerodynamic coefficients is given for determining the stability of the bifurcating period motion. For supersonic/hypersonic flat plate airfoils the bifurcating periodic motion is found to be unstable. This implies that when the angle of attack is increased past that of neutral damping, there will be drastic changes of the motion of the aircraft from its steady flight condition at the critical angle, including, e.g. hysteresis. (Author)

A82-17864 # **Aerodynamics of tactical weapons to Mach number 8 and angle-of-attack of 180 deg.** L. Devan, L. A. Mason, and F. G. Moore (U.S. Navy, Naval Surface Weapons Center, Dahlgren, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0250.* 13 p. 14 refs. Army-sponsored research. Navy Task RF32-391-801; SEA Task SF32392-591; SEA Task SR02302.

The Naval Surface Weapons Center Aeroprediction Code has been extensively applied to the prediction of static and dynamic aerodynamics of missile configurations. Major extensions have recently been made to the code to extend its capability to freestream Mach number between 0 and 8 and angles of attack between 0 and 180 deg, and also to improve the transonic, inviscid, body-alone, static, aerodynamic predictions and the dynamic derivative predictions for all Mach numbers. The theoretical basis for the code extensions are outlined and previous methods are briefly reviewed. The code is evaluated through comparisons of computational examples with experiment for body-alone, body-tail and body-tail-canard configurations. The speed and accuracy of the code are ideal for use in preliminary design. (Author)

A82-17865 # **Relaxation solution for viscous transonic flow about fighter-type forebodies and afterbodies.** R. R. Cosner (McDonnell Aircraft Co., St. Louis, MO). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0252.* 10 p. 12 refs.

The velocity-splitting method for solving the Navier-Stokes equations has been formulated into a procedure to predict external 3-D flowfields at subsonic and transonic speeds. A wide range of geometry can be treated, including realistic fighter-type forebody and afterbody configurations. Accurate results for pressure and drag have been obtained for several configurations at transonic speeds, including cases in which the pressure field is modified substantially by boundary layer separation. The procedure has demonstrated the needed accuracy, versatility, reliability, and economy to be a practical engineering tool. (Author)

A82-17866 # **Performance calibration results for a Compact Multimission Aircraft Propulsion Simulator.** C. D. Wagenknecht, G. E. Hoff (General Electric Co., Cincinnati, OH), and T. J. Norbut (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0254.* 12 p. 9 refs.

Experimental performance data were obtained for a Compact Multimission Aircraft Propulsion Simulator configured with dry and reheat exhaust nozzles simulating a broad range of advanced multimission aircraft propulsion system cycles. Exhaust nozzles, pancake mixers, and circular arc venturi flow meters were calibrated over the expected range of operation prior to simulator testing. Agreement of the C-MAPS performance results with the calibration data are presented in order to assess methods for determining installed simulator inlet airflow. Installed operability considerations with regard to cycle simulation, model scaling, and aircraft integration are discussed. The C-MAPS test program demonstrated a 20 percent improvement in engine pressure ratio simulation capability relative to a prototype design. This was accomplished for the 1.65 lb/sec. C-MAPS in a compact size equivalent to a 36 percent overall length reduction and a 21 percent maximum diameter reduction. (Author)

A82-17867 # **Digital test pilot concept.** W. J. Bezdek (McDonnell Aircraft Co., St. Louis, MO) and R. T. Galloway (U.S. Navy, Naval Training Equipment Center, Orlando, FL). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0259.* 12 p. 9 refs.

A series of automated digital tests have been developed to verify the fidelity of aircraft systems, performance, and flying qualities for aircraft models developed for man-in-the-loop simulation. The aircraft digital tests include time to accelerate/decelerate, level turning performance, time to climb/descend, steady state trim, dynamic longitudinal stability, static and dynamic lateral-directional stability, lateral control effectiveness, and engine operation. The implementation of the test driver equations, verification of the test methods and comparisons with other validation methods are described. Examples using F-4J/S flight test data are used to demonstrate the concept. (Author)

A82-17868 * # **Real-time simulation of helicopter IFR approaches into major terminal areas using RNAV, MLS, and CDTI.** L. Tobias, H. Q. Lee, L. L. Peach (NASA, Ames Research Center, Moffett Field, CA), F. M. Willett, Jr., and P. J. O'Brien (FAA, Technical Center, Atlantic City, NJ). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0260.* 13 p. 11 refs.

Helicopter IFR routes at hub airports have been investigated in an air-traffic-control system simulation involving a piloted helicopter simulator, computer-generated air traffic, and air traffic controllers. Problems studied included: (1) pilot acceptance of the approach procedure and tracking accuracy; (2) ATC procedures for handling a mix of helicopter and fixed-wing traffic; and (3) utility of the Cockpit Display of Traffic Information (CDTI) for the helicopter. Results indicate that the helicopter routes were pilot acceptable and were noninterfering with fixed-wing traffic. Merging and spacing maneuvers using CDTI were successfully carried out by the pilots, but controllers had some reservations concerning CDTI. (Author)

A82-17874 # **Icing analysis of an unprotected aircraft radome.** J. Stone and R. Ross (Ross Aviation Associates, Sedgwick, KS). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0281.* 6 p.

Artificial icing tests were conducted to determine the rate of ice accretion on an unprotected aircraft radome. These data are correlated with accepted means of calculating water catch rate. The theoretical method of calculating water catch rate is subsequently modified to produce a more accurate prediction technique. A method is also developed to predict the thickness distribution of the accumulated ice on the radome. Since fully descriptive icing tunnel data does not exist for radome shapes, assumptions are made concerning the shape of the forward fuselage in the determination of the average collection efficiency. Other assumptions, such as ice density and the amount of water catch that freezes, are made to give the highest ice accumulation. (Author)

A82-17875 # **A Microwave Ice Accretion Measurement Instrument - MIAMI.** B. Magenheim and J. K. Rocks (Ideal Research, Inc., Rockville, MD). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0285.* 9 p.

A Microwave Ice Accretion Measurement Instrument (MIAMI), controlled by a microprocessor, has been developed that can: (1) detect the presence of ice and sound an alarm; (2) measure and digitally display the ice thickness and ice accretion rate; (3) plot the ice thickness and accretion rate on a pen recorder; (4) log and printout a permanent record of the ice thickness and ice accretion rate versus time; and (5) store data for delayed time statistical analysis and printout. The MIAMI was tested in the NASA Lewis Research Center's Icing Research Tunnel, demonstrating its ability to measure ice growth on a two-dimensional air foil. The MIAMI transducer is constructed from solid-state components, all of which have a low mass and are ruggedly built. The device may be mounted nonintrusively on any part of the aircraft skin, including the rotor blades and engine inlets. J.F.

A82-17894 * # **The NASA MERIT program - Developing new concepts for accurate flight planning.** R. Steinberg (NASA, Lewis

Research Center, Cleveland, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0340*. 8 p.

It is noted that the rising cost of aviation fuel has necessitated the development of a new approach to upper air forecasting for flight planning. It is shown that the spatial resolution of the present weather forecast models used in fully automated computer flight planning is an important accuracy-limiting factor, and it is proposed that man be put back into the system, although not in the way he has been used in the past. A new approach is proposed which uses the application of man-computer interactive display techniques to upper air forecasting to retain the fine scale features of the atmosphere inherent in the present data base in order to provide a more accurate and cost effective flight plan. It is pointed out that, as a result of NASA research, the hardware required for this approach already exists. C.R.

A82-17895 # **Minimum cost atmospheric cruise control - Most efficient airspeed for a given wind component.** C. L. Chandler and C. J. Emmons (Delta Air Lines, Inc., Atlanta, GA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0341*. 4 p.

Attention is called to the fact that many airlines overlook the effect of winds when setting the cruise speeds that will produce the most economical speed schedule for a flight. It is shown through calculations that as a headwind gets stronger the Mach number should be increased or at least maintained. Conversely, as the tailwinds increase in strength, the Mach number should be reduced. Another advantage of the method proposed is the improvement that would be seen in on-time performance by compensating for the winds with the wider use of Mach numbers. C.R.

A82-17896 * # **The influence of turbulence models on computer-simulated aircraft landing.** W. Frost (Tennessee, University, Tullahoma, TN), S.-T. Wang (FWG Associates, Inc., Tullahoma, TN), and D. W. Camp (NASA, Marshall Space Flight Center, Huntsville, AL). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0342*. 4 p. 9 refs. Contract No. NAS8-32692.

Three models of simulated atmospheric turbulence were used to determine their respective influence on a computer-simulated, DC-8 type, aircraft landing. Statistical results based on a sample of 20 simulated landings illustrate the influence of turbulence simulated by the different models. For the same spectrum function, a non-Gaussian turbulence model produces the higher degree of touchdown variability. When different spectrum functions are used the von Karman model induces a smaller standard deviation in position error than the Dryden model. The turbulence energy contained by the higher frequency fluctuation has little effect on the landing position. (Author)

A82-17900 * # **Computations of transonic flow over an oscillating airfoil with shock-induced separation.** W. J. Chyu and K. Kuwahara (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0350*. 11 p. 22 refs.

A numerical study is presented on unsteady transonic flow over an airfoil in pitching oscillation at a moderately high incidence. The study was focused on the effects of unsteady shock-wave/boundary-layer interactions and subsequent flow separations. An implicit finite-difference scheme was used to solve the full time-dependent compressible Navier-Stokes equations in conservation-law form. The algorithm adapted for this study is the Beam-Warming spatially factored scheme. It is, however, constructed in a body-fitted curvilinear coordinate system for efficient unsteady flow computations. The computational results are compared with experimental data measured in the Ames 11- by 11-Foot Transonic Wind Tunnel. (Author)

A82-17901 # **Instantaneous turbulence profiles in the wake of an oscillating airfoil.** J. De Ruyck and C. Hirsch (Brussel, Vrije Universiteit, Brussels, Belgium). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0353*. 13 p. 18 refs. Research supported by the Fonds National de la Recherche Scientifique; Grant No. DAJA37-80-C-0367.

Instantaneous velocity and turbulence profiles are measured in the wake of a NACA 0012 oscillating airfoil. All non-zero Reynolds stresses are determined using a single slanted rotating hot wire measurement technique. Data acquisition is performed through an on-line sampling, digitizing and recording facility. Measurements are made at 0.7, 2, 5, 10 and 20% chord downstream of the trailing edge. The frequency coefficient ranges from 0 to 1.23. Four mean incidences are considered corresponding to no stall, stall onset and light dynamic stall. Results are discussed and compared with steady state results. (Author)

A82-17902 # **Numerical computation of optimal atmospheric trajectories involving staged vehicles.** C. R. Hargraves (Boeing Co., Seattle, WA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0360*. 6 p. 5 refs.

A trajectory optimization procedure is described which can solve practical problems involving staged vehicles or discontinuous equations of motion. It is an extension of a computer code called CTOP (Chebychev Trajectory Optimization Program) which was described by Hargraves et al. (1981). With CTOP, the state and control variables are described as functions of time by patched polynomials. A subset of the patch points (including initial and final time) may be designated as free parameters called events. It is pointed out that discontinuities may occur at events and that the payoff may depend on them. The values of the events are adjusted in order to achieve the desired optimum. Numerical examples are presented. C.R.

A82-17904 # **Constant L/D glide trajectories.** J. L. Raymond (Hughes Aircraft Co., Missile Systems Group, Canoga Park, CA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0362*. 7 p.

The present paper reviews the phenomenon of constant L/D glide trajectories with the result that new, simple and accurate closed-form expressions are derived. They include relations between glide path angle, altitude, time, velocity, density, and dynamic pressure. Results obtained compare well with those obtained by a digital computer using step-by-step integration of the equations of motion for a point mass. The relations may be used for rapid preliminary design estimates of constant L/D trajectories. (Author)

A82-17905 # **Optimum configuration for a 10 passenger business turbofan jet airplane.** M. Aronson. *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0365*. 11 p. 7 refs.

The optimum external configuration for an airplane which will meet specific design and performance requirements is determined by use of an analytical method which considers systematic variations of wing sweep, thickness ratio, fuselage fineness ratio, cruising speed and design weight. Relationships between the various structural, weight and aerodynamic parameters used in the method are derived. Evaluation of the parameters is then based on limits imposed by current experience and assumptions. The specific design objective in this study was to minimize take-off weight and maximize the cruising speed for a specific range with a designated power plant. The optimum configuration resulting from this study has 38 deg wing sweep and 14.6% wing section thickness, a ramp weight of 21,575 pounds and a range of 2500 n. miles with 10 passengers. Besides providing an optimum design and an analytical method for its determination, the method and a number of the curves can be used to determine configurations which will meet other specific performance requirements. (Author)

A82-17906 # **Optimal trajectories in supersonic flight.** [illegible] Lin (Applied Dynamics International, Ann Arbor, MI). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0366*. 10 p. 5 refs.

A discussion emphasizing the analytic aspect of the theory of the optimal trajectories is presented, beginning with an overview of optimal trajectories in two dimensions. Solving the general problem of optimal trajectories in three dimensions is discussed in detail. Included here are the general properties of optimal trajectories consisting of the integrals of motion and the characteristic features in engine and aerodynamic controls. In addition, the optimality of the wing are investigated in detail. In the case of low frequency oscillations, numerical solution is obtained by the non-steady vortex-lattice method which can be used to calculate the rolling moment aerodynamic derivatives of the wing due to yaw and side slip. Some of the computed results are compared with the experimental results. Author

THE USE OF FLIGHT MANAGEMENT COMPUTERS IN AIR CARRIER OPERATIONS IN THE 1980S Interim Report
I. Gershkoff Washington FAA Aug. 1981 113 p refs
(Contract DTFA01-80-C-10030)
(AD-A105621; Rept-1378-11-1-2482; FAA-EM-81-10) Avail: NTIS HC A06/MF A01 CSCL 09/2

The use of on-board flight management computers (FMCs) in air carrier operations has the potential for significant fuel savings. This report assesses the general capabilities of the FMCs currently available. From this information, economic benefits and rates at which aircraft would be equipped were developed. Minimum-cost flight profiles were analyzed for various common conditions to determine the problems associated with incorporating the capabilities of FMCs into a heavy traffic Air Traffic Control environment. ADVANCED CRASH SURVIVABLE FLIGHT DATA RECORDER AND ACCIDENT INFORMATION RETRIEVAL SYSTEM (AIRS) Final Report, Oct. 1978 - Dec. 1980
Henry R. Ask, Donald L. White, and Kent E. Berwick Fort Eustis, Va. Army Research and Technology Labs. Aug. 1981 166 p refs
(Contract DAAK51-78-C-0025; DA Proj. 1L1-62209-AH-76)
(AD-A105510; ESP-8109; USAAVRADCOM-TR-81-D-20) Avail: NTIS HC A08/MF A01 CSCL 01/3

The Accident Information Retrieval System, (AIRS) development program consisted of four phases. Design concepts were formulated based on selection and definition of aircraft parameters to be monitored by the AIRS, selection of memory technology, circuit definitions for aircraft interfacing, and studies and tests related to the development of an armored module to protect the memory device. Brassboard electronics were fabricated and tested and software which proved the feasibility of data collection and storage in a solid-state memory device utilizing unique data compression techniques to reproduce critical aircraft flight information was developed and tested. Flight-worthiness assurance tests were performed on the AIRS brassbroad. The hardware was installed in a Sikorsky UH-60A BLACK HAWK helicopter. The system was reviewed for final configuration, risk areas, final size (207 cu. in. or less), weight (less than 9.3 lbs.), and life cost (greater than 10,000 hours MTBF). GRA

ANALYSIS OF TWO AIR TRAFFIC SAMPLES IN THE TERMINAL AREA OF FRANKFURT/MAIN, AUGUST 4TH 1978
Uwe Voelckers, Manfred Schubert, and Albrecht Seyfried 1981 127 p refs In GERMAN
(DFVLR-Mitt-81-12) Avail: NTIS HC A07/MF A01

Two 'arrival peaks' are analyzed. Computer programs used to combine data recorded from several sources are discussed. Traffic analysis includes quantitative evaluation of traffic density, studies of air traffic distributions relating to space and time, investigation of air traffic control procedures, determination of the approach control planning strategies, and a basic investigation of traffic vectoring in the terminal area. The similarities and differences of the two traffic samples are discussed. N.W.

IN-SERVICE TESTING OF THE PRECISION APPROACH PATH INDICATOR (PAPI) AT NEWARK INTERNATIONAL AIRPORT, NEW JERSEY Interim Report, Dec. 8, 1980 - Apr. 8, 1981
Bret B. Castle Dec. 1981 11 p
(DOT-081-502-510)
(DOT/FAA/RD-81/95; DOT/FAA/CT-81/79) Avail: NTIS HC A02/MF A01

The Precision Approach Path Indicator (PAPI) tests involving four months of inservice testing at Newark International Airport, New Jersey are presented. Basically, the PAPI was compared against the standard red/white Visual Approach Slope Indicator (VASI) system at a large airport and on a runway with an Instrument Landing System (ILS). The PAPI system was installed in a manner to take care of aircraft of all sizes: that is, different wheel to eye distances. Information was obtained from pilots of large commercial aircraft. Results show that under these conditions about 60 percent of the pilots prefer the PAPI over the VASI system. S.L.

REQUIREMENTS FOR INSTRUMENT APPROACHES TO TRIPLE PARALLEL RUNWAYS
T. N. Shimi, W. J. Swedish, and L. C. Newman Jul. 1981 148 p refs
(Contract DTFA01-81-C-10001)
(AD-A105622; MTR-81W146; FAA-EM-81-12) Avail: NTIS HC A07/MF A01 CSCL 01/2

Current ATC procedures do not consider instrument approaches to more than two parallel runways. This document discusses the engineering results of an analysis that examined the technical feasibility of conducting triple parallel instrument approaches as a means of increasing the aircraft flow at congested airports. The technical criteria that were subjected to analysis include the physical characteristics of the airfield, airspace and aircraft mix, surveillance (the radar and display systems), and control (procedures for normal and abnormal operations. The expected performance in safety and capacity was estimated for alternative landing concepts. An analysis was conducted of blunders and evasion strategies. It was found that, for a given configuration, a single blunder recovery strategy could be specified that would produce acceptable separations between aircraft. Missed approaches on triple parallels and pilot acceptance of triple approaches are also discussed. Lastly, recommended requirements and control procedures for triple parallel instrument approaches are presented. Author (GRA)

REQUIREMENTS FOR INDEPENDENT AND DEPENDENT PARALLEL INSTRUMENT APPROACHES AT REDUCED RUNWAY SPACING
A. L. Haines and W. J. Swedish Washington FAA May 1981 182 p refs
(Contract DTFA01-81-C-10001)
(AD-A105673; MTR-81W15; FAA-EM-81-8) Avail: NTIS

HC A09/MF A01 CSCL 01/2

Independent parallel instrument approaches are conducted today only if the runway centerlines are 4300 ft apart or more. The rationale behind this criterion is reviewed, and the requirements for reducing the criterion to 3000 ft are evaluated. Although some benefit is derived from improvements in navigational accuracy, the performance of the surveillance system has the greatest impact on the required runway spacing. Dependent alternating instrument approaches to parallel runways are also evaluated. Currently such approaches require a runway spacing of 3000 ft or more. The effects of reducing this runway spacing are discussed, especially with regard to blunder recovery. Reducing the runway spacing required for these approaches could increase the arrival capacity and reduce delays at certain airports and would provide increased flexibility for planning new runways. A METHOD FOR MEASURING TAKEOFF AND LANDING PERFORMANCE OF AIRCRAFT, USING AN INERTIAL SENSING SYSTEM

A. Pool, J. L. Simons, G. J. H. Wensink, and A. J. L. Willekens 26 Sep. 1980 10 p refs Presented at AGARD Flight Mech. Panel Symp. on Subsystem Testing and Flight Test Instrumentation, Geilo, Norway, 27-30 Oct. 1980
(NLR-MP-80036-U) Avail: NTIS HC A02/MF A01

An inertial sensing system, STALINS, used to provide trajectory data for takeoff and landing measurement instrument design, is presented. The system specifications based on certification requirements for civil transport aircraft are defined for continuous and rejected takeoff, minimum unstick speed, minimum control speed on the ground, and landing. Calculations are performed using a computer program supplemented by a manual check, giving horizontal distance and height measurements. Data are made available within 24 hours. The method is accurate and is suitable for tests at several airfields, since instrumentation is either onboard already, or easily transported by the aircraft. Author (ESA)

A GENERAL AVIATION SIMULATOR EVALUATION OF A RATE-ENHANCED INSTRUMENT LANDING SYSTEM DISPLAY

David A. Hinton Dec. 1981 44 p
(NASA-TP-1950; L-13911) Avail: NTIS HC A03/MF A01 CSCL 01D

A piloted-simulation study was conducted to evaluate the effect on instrument landing system tracking performance of integrating localizer-error rate with raw localizer and glide-slope error. The display was named the pseudocommand tracking indicator (PCTI) because it provides an indication of the change of heading required to track the localizer center line. Eight instrument-rated pilots each flew five instrument approaches with the PCTI and five instrument approaches with a conventional course deviation indicator. The results show good overall pilot acceptance of the display, a significant improvement in localizer tracking error, and no significant changes in glide-slope tracking error or pilot workload. B.W.

A TRUE AIR SPEED SENSOR FOR MINIATURE UNMANNED AIRCRAFT

J. A. C. Beattie Jun. 1981 11 p refs
(RAE-TM-SPACE-287; BR80018) Copyright. Avail: Issuing Activity

A prototype sensor with digital output is described. Vortex shedding principles are exploited by using a bluff body with end-plates to produce a stable set of vortices alternately from the edges of the body. Vortex production frequency is directly proportional to the speed of the fluid past the body. A pair of printed thick film thermistors detect the vortices. Tests show excellent linearity of response, although sensor geometry, and signal processing electronics can be improved. Author (ESA)

OPTICAL PROPERTIES OF AIRFIELD LIGHTING FIXTURES OF THE ROYAL NETHERLANDS AIRFORCE. PART 1: COLOR MEASUREMENTS
P. Padmos and R. vanLeeuwen 1980 20 p In DUTCH; ENGLISH summary 2 Vol.
(Contract A78/KLu/085)
(IZF-1980-1-Vol-1; TDCK-73414) Avail: NTIS HC A02/MF A01

Airfield lighting fixtures in use in the Royal Netherlands' Airforce were sampled and used to measure to what extent the chromaticity coordinates are corresponding to the NATO-Standardization Agreements. For the yellow and red filters, especially, it is important to measure the chromaticity of the mounted lamp-filter combinations, because heating may cause a considerable shift in chromaticity. For each fixture the measurements were performed at nominal maximum luminous intensity. Moreover, for a number of representative colors, measurements were made at the reduced intensity settings normally in use. Conclusions regarding, rejecting, or accepting are tabulated. Author

OPTICAL PROPERTIES OF AIRFIELD LIGHTING FIXTURES OF THE ROYAL NETHERLANDS AIRFORCE. PART 2: INTENSITY MEASUREMENTS
P. Padmos and R. vanLeeuwen 1980 38 p In DUTCH; ENGLISH summary 2 Vol.
(Contract A78/KLu/085)
(IZF-1980-12-Vol-2; TDCK-75011) Avail: NTIS HC A03/MF A01

Most lighting fixtures did not fulfill NATO-Standardization requirements in one or another way. The most conspicuous error was found in a taxiway fixture, where the beam maximum appeared to be directed downwards. Many red filters have a deep red color, which lessens the light output. In most cases a considerable improvement in light output can be obtained by applying a more orange-red-color, for which the color requirements give room. It appears that for some red glass filters the transmission is lowered considerably by heating. Author

DEVELOPMENT AND TRIAL OF A ROTARY BALANCE FOR THE 3 m-LOW SPEED WIND TUNNELS IN THE FEDERAL REPUBLIC OF GERMANY Final Report, Dec. 1979
Bernd Schulze Bonn Bundesministerium fuer Forschung und Technologie Jul. 1981 70 p refs In GERMAN, ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-81-022; ISSN-0170-1339) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 14,70

A rotary balance was developed for determining aerodynamic damping due to rolling by means of a stationary measuring procedure. Due to the uniform rotation around the wind tunnel axis, vortex relaxation effects that might result from oscillatory balances are avoided. Layout, instrumentation, and data processing are described. Results obtained by using the apparatus during different wind tunnel tests with a calibration model correlate well with existing reference data and flight test data. Dynamic stability derivates due to rolling can be measured for angles of attack up to 90 deg and for extreme angles of inclination. Author (ESA)

SENSOR FOOTPRINTS AND HOMING RANGE OF TERMINAL GUIDANCE MUNITION [SENSOR-FOOTPRINT UND NACHLENKBEREICH BEI ENDPHASENGELENKTER MUNITION]
K.-D. Leuthaeuser and H. Wessel Bonn Bundesministerium der Verteidigund 1981 56 p refs In GERMAN Sponsored by Bundesministerium der Verteidigung
(BMVg-FBWT-81-5) Avail: NTIS HC A04/MF A01; DOKZENTBw, Bonn DM 30

The footprints of terminal guidance projectiles were analyzed. These footprints, which correspond to the accessible target range on the surface, depend on the vision range of the sensor and on the homing range of the projectile. The sensor vision range is calculated as a function of trajectory parameters, sensor aperture, and sensor range. The extent of the homing range is determined for the special case of circular trajectories, i.e., proportional navigation, in dependence of flight height, angle of incidence, and maximal transverse acceleration. The resulting footprints are represented in overlay diagrams. Author (ESA)

HIGH TEMPERATURE ELECTRONIC REQUIREMENTS IN AEROPROPULSION SYSTEMS
William C. Nieberding and J. Anthony Powell *In its* Proc. of The Conf. on High-Temp. Electron. 1981 p 13-16 refs

(E-708) Avail: NTIS HC A07/MF A01 CSCL 09C

The needs for high temperature electronic and electro-optic devices as they would be used on aircraft engines in either research and development applications, or operational applications are discussed. The conclusion reached is that the temperature at which the devices must be able to function is in the neighborhood of 500 to 600 C either for R&D or for operational applications. In R&D applications the devices must function in this temperature range when in the engine but only for a moderate period of time. On an operational engine, the reliability requirements dictate that the devices be able to be burned-in at temperatures significantly higher than those at which they will function on the engine. The major point made is that semiconductor technology must be pushed well beyond the level at which silicon will be able to function. M.G.

RELATIONS FOR THE THERMODYNAMIC AND TRANSPORT PROPERTIES IN THE TESTING ENVIRONMENT OF THE LANGLEY HYPERSONIC CF4 TUNNEL
Kenneth Sutton Oct. 1981 40 p refs
(NASA-TM-83220) Avail: NTIS HC A03/MF A01 CSCL 20D

Thermodynamic and transport properties of gaseous CF4 that can be used in flow field computer codes and theoretical analyses for comparison of results with experimental data from the Langley Hypersonic CF4 Tunnel are presented. The thermodynamic relations which are based on thermally perfect but calorifically imperfect gas are adequate for the testing environment of the CF4 tunnel and are simpler to use than the imperfect gas relations required to define the complete expansion from the tunnel reservoir. Relations for the transport properties are based on the kinetic theory of gases in which published experimental data are used in the derivation of the relations. Extensive experimental data were located for viscosity and the derived relation should provide values for viscosity with errors of less than 1 percent. The experimental data for thermal conductivity were limited with significant disagreement between the various sources. The derived relation will probably provide values for the thermal conductivity with errors of no more than 5 percent which is within the accuracy of the experimental data. M.D.K.

A GLOBAL ATLAS OF GEOS-3 SIGNIFICANT WAVEHEIGHT DATA AND COMPARISON OF THE DATA WITH NATIONAL BUOY DATA
J. D. McMillan Wallops Island, Va. NASA. Wallops Flight Center Nov. 1981 163 p refs

(Contract NAS6-2639)
(NASA-CR-156882) Avail: NTIS HC A08/MF A01 CSCL 08C

The accuracy of the GEOS-3 significant waveheight estimates compared with buoy measurements of significant waveheight were determined. A global atlas of the GEOS-3 significant waveheight estimates gathered is presented. The GEOS-3 significant waveheight estimation algorithm is derived by analyzing the return waveform characteristics of the altimeter. Convergence considerations are examined, the rationale for a smoothing technique is presented and the convergence characteristics of the smoothed estimate are discussed. The GEOS-3 data are selected for comparison with buoy measurements. The GEOS-3 significant waveheight estimates are assembled in the form of a global atlas of contour maps. Both high and low sea state contour maps are presented, and the data are displayed both by seasons and for the entire duration of the GEOS-3 mission. E.A.K.

POLLUTION OF THE SOIL BY AVIATION GASOLINE
A. Verweij Aug. 1979 26 p ref In DUTCH; ENGLISH summary
(Contract A78/KL4/146)
(PML-1979-41; TDCK-73390) Avail: NTIS HC A03/MF A01

A literature search was conducted to determine the effects of aviation gasoline spills and more general oil spills on the environment and on the condition of oil storage tanks. Remedial measures are presented. Attention is given to natural restoration processes as well as to actions to speed up these processes. Author

OPTICAL INFORMATION PROCESSING FOR AEROSPACE APPLICATIONS
Dec. 1981 347 p refs Conf. held in Hampton, Va., 18-19 Aug. 1981
(NASA-CP-2207; L-15016) Avail: NTIS HC A15/MF A01 CSCL 20F

Current research in optical processing is reviewed. Its role in future aerospace systems is determined. The development of optical devices and components demonstrates that system concepts can be implemented in practical aerospace configurations.

N82-15997*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
ROLE OF OPTICAL COMPUTERS IN AERONAUTICAL CONTROL APPLICATIONS
Robert J. Baumbick *In* NASA. Langley Research Center Opt. Inform. Process. for Aerospace Appl. Dec. 1981 p 33-43

Avail: NTIS HC A15/MF A01 CSCL 20F

The role that optical computers play in aircraft control is determined. The optical computer has the potential high speed capability required, especially for matrix/matrix operations. The optical computer also has the potential for handling nonlinear simulations in real time. They are also more compatible with fiber optic signal transmission. Optics also permit the use of passive sensors to measure process variables. No electrical energy need be supplied to the sensor. Complex interfacing between optical sensors and the optical computer is avoided if the optical sensor outputs can be directly processed by the optical computer. S.L.

THE OPTICAL RECOGNITION OF SEA TARGETS AS A FUNCTION OF SURROUNDING AND OBSERVATION PARAMETERS IN AIR TO WATER OBSERVATIONS
Hans-Eberhard Hoffmann Bonn Bundesministerium der Verteidigung 1981 41 p refs In GERMAN; ENGLISH summary
(BMVG-FBWT-81-10) Avail: NTIS HC A03/MF A01; DOKZENTBW, Bonn DM 30

The influence of environmental and observation parameters on visibility ranges, maximum detection range, and maximum identification range were determined. The determination of the visibility ranges and the measurements of environmental parameters took place from helicopters. On the basis of the test results the influence of the following parameters on visibility ranges is shown: visual range, illumination, flight altitude, and environmental brightness as environmental parameters; and naked eye, light-intensifier, night goggles, limitation of field of view as observation parameters. T.M.

THE INFLUENCE OF AERONAUTICAL R&D EXPENDITURES UPON THE PRODUCTIVITY OF AIR TRANSPORTATION Final Report, 1926-1976
Ralph C. Lenz, John A. Machnic, and Anthony W. Elkins Jul. 1981 248 p refs
(Grant NSF SRS-79-10087)
(PB81-247140; UDR-TR-81-72; NSF/SIU-81-1) Avail: NTIS HC A11/MF A01 CSCL 05A

The impact which aeronautical R&D expenditures have had upon productivity growth in the air transportation industry over the 50-year period from 1926 to 1976 is examined. Quantitative analyses of the returns on U.S. investments in aeronautical R&D show that the net gains from such investments are very large in comparison with standard commercial opportunities during the same period. The gains were distributed primarily to the traveling public and, to a lesser extent, to the airline employees. Author

COMMUNITY ROTORCRAFT AIR TRANSPORTATION BENEFITS AND OPPORTUNITIES Final Report, Dec. 1981
Glen A. Gilbert, Darral J. Freund, Robert M. Winick, Nicholas J. Cafarelli, Richard F. Hodgkins, Tirey K. Vickers et al Dec. 1981 181 p refs
(Contract NAS2-10788)
(NASA-CR-166268) Avail: NTIS HC A09/MF A01 CSCL 01C

Information about rotorcraft that will assist community planners in assessing and planning for the use of rotorcraft transportation in their communities is provided. Information useful to helicopter researchers, manufacturers, and operators concerning helicopter opportunities and benefits is also given. Three primary topics are discussed: the current status and future projections of rotorcraft technology, and the comparison of that technology with other transportation vehicles; the community benefits of promising rotorcraft transportation opportunities; and the integration and interfacing considerations between rotorcraft and other transportation vehicles. Helicopter applications in a number of business and public service fields are examined in various geographical settings. R.J.F.

AERONAUTICS AND SPACE REPORT OF THE PRESIDENT, 1980 ACTIVITIES
1981 108 p
(NASA-TM-84078) Avail: NTIS HC A06/MF A01 CSCL 05A

The year's achievements in the areas of communication, Earth resources, environment, space science, transportation, and space energy are summarized and current and planned activities in these areas at the various departments and agencies of the Federal Government are summarized. Tables show U.S. and world spacecraft records, spacecraft launchings for 1980, and scientific payload and probes launched 1975-1980. Budget data are included. A.R.H.

CONTROL SURFACES
Stress intensity factor measurements in composite sandwich structures
A82-17535
Concerning the calculation of the aerodynamic characteristics of mechanized wings
A82-18589
CONTROL VALVES
Cavitation inception in spool valves
A82-16428
CONTROLLABILITY
In-flight investigation of the effects of pilot location and control system design on airplane flying qualities for approach and landing
[NASA-CR-163115] N82-15074
CONVECTION
Gas turbine ceramic-coated-vane concept with convection-cooled porous metal core
[NASA-TP-1942] N82-14090
CONVECTIVE FLOW
Mesoscale convective weather systems and aviation operations
[AIAA PAPER 82-0015] A82-17733
The Joint Airport Weather Studies project --- investigation of convective microbursts
[AIAA PAPER 82-0017] A82-17734

preparation of management information, as well as progress, cost and performance reporting. It may even play a future role in forming the contract with the customer. J.F.

A82-16558 **Special problems associated with aircraft radomes.** D. A. Conti (British Aerospace Public, Ltd., Co., Dynamics Group, Stevenage, Herts., England). *IEE Proceedings, Part F - Communications, Radar and Signal Processing,* vol. 128, pt. F, no. 7, Dec. 1981, p. 412-418. 13 refs.

The paper discusses the design and manufacturing aspects of nose radomes for high-speed aircraft. Aircraft radomes are an acceptable comprise of the conflict between the electrical, structural, environmental and aerodynamic requirements. The paper reviews the requirements placed on the design and summarizes the basic radome design and construction methods, as applied in current radome technology, concluding with an examination of the shortcomings of existing radomes and an indication of possible solutions to current problems. (Author)

A82-16559 **Advanced cockpit for tactical aircraft.** G. Roe (British Aerospace Public, Ltd., Co., Aircraft Group, Brough, Humberside, England). *IEE Proceedings, Part F - Communications, Radar and Signal Processing,* vol. 128, pt. F, no. 7, Dec. 1981, p. 419-426. 8 refs.

The progressive development of aircraft systems and changes in their requirements over the past 20 years are shown to have affected the cockpit of the Harrier aircraft. Several mature technologies, as well as several which are likely to mature within the next ten years are described. Ways in which these technologies may be used to redesign an all-electronic cockpit, while still meeting the pilot's basic need to remain in overall control of the aircraft and its system, are discussed. A final advanced cockpit design is offered: it consists of a side-mounted flight controller and sliding-throttle arrangement, with the appropriate controls and switches to facilitate a hands-on-throttle-and-stick operation. All once-aflight-type switches are located on the right console, reducing hands-off stick operation, while all major system panels are located on the left console. When possible, all controls are located on a priority and frequency-of-use basis. J.F.

A82-16560 **Techniques for overhead-wire detection.** K. E. Potter (Royal Signals and Radar Establishment, Malvern, Worcs., England). *IEE Proceedings, Part F - Communications, Radar and Signal Processing,* vol. 128, pt. F, no. 7, Dec. 1981, p. 427-432.

The paper describes three wire detection techniques. A millimetre-wave pulsed radar system operating on the grating returns from wires with a regular mechanical structure is discussed. Experimental evidence at 35 GHz proves the operational philosophy of the system and suggests that higher frequencies would produce more successful results. A passive 50 Hz system operating on the magnetic flux produced by live overhead power cables is shown to be capable of indicating the presence and direction of such wires at ranges in excess of 500 m. Finally, a CO2 pulsed laser radar is discussed together with a processing algorithm to highlight wire presence. It is shown that identification of a 1/8 in. diameter wire at 200 m range and in a visibility of 200 m is possible using only 4 W of laser power. (Author)

A82-16561 **Trends in maintainability and reliability of avionics systems with particular reference to DCAD Technical Publication 1/77.** A. F. Loy (Ministry of Defence /Procurement Executive/, London, England). *IEE Proceedings, Part F - Communications, Radar and Signal Processing,* vol. 128, pt. F, no. 7, Dec. 1981, p. 433-439. 6 refs.

The procurement situation with respect to reliability and maintainability (R&M), prior to the DCAD Technical Publication 1/77 (1978), is reviewed first. The general contents of the document and the translation of the document's principles into a form suitable for contracts are then discussed. Application of the publication is outlined, and an indication is given of the direction R&M activity should proceed in order to meet the challenges of future systems. Particular attention is given to the reliability parameter, which has presented a more serious problem during the design, development, and production phases. J.F.

A82-16562 **Head-up displays - The integrity of flight information.** L. L. Dopping-Hepenstal (British Aerospace Public, Ltd., Co., Aircraft Group, Kingston-upon-Thames, Surrey, England). *IEE Proceedings, Part F - Communications, Radar and Signal Processing,* vol. 128, pt. F, no. 7, Dec. 1981, p. 440-442.

Single-pilot military aircraft are usually designed with head-up displays (HUD), which enhance the safe operational flight envelope and the flexibility of weapons delivery. The shortcomings of the self-monitoring circuits in these HUD systems require the pilot to continually cross-check the display with the conventional head-down instruments. A fully integrated approach to the system design is required which would tackle the subject as a whole, and not as a set of individual equipment-related problems. Sensor redundancy is the most straightforward way to improve system integrity, but is likely to have the highest cost, weight, and installation penalty. A general solution will probably not be found, since each aircraft system will have to be studied with respect to its equipment fit, as well as its operational task and environment. J.F.

A82-16563 **VOR waveform synthesis and calibration.** R. W. White, R. N. Clarke, and R. W. Yell (National Physical Laboratory, Teddington, Middx., England). *IEE Proceedings, Part F - Communications, Radar and Signal Processing,* vol. 128, pt. F, no. 7, Dec. 1981, p. 443-450. 9 refs.

The development and assessment of two standard VHF omni-range radial systems (VOR) waveform synthesizers and a VOR waveform decoder are considered. The synthesizers are designed to regenerate waveforms for calibrating aircraft receivers on the ground. One synthesizer, a computer-controlled system, is excellent for producing imperfect waveforms; the second synthesizer standard is a compact portable unit suitable for field system testing and standards dissemination. The decoder design is based on digital sampling and storage of one cycle of the composite audio waveform; the data is then Fourier transformed and analyzed to determine the FM depth and the differential phase of the two 30 Hz modulating signals, the VOR bearing angle. The standard synthesizer and decoder standards have demonstrated uncertainties not exceeding the 95% confidence level. The sensitivity of the detection method to digitization uncertainties, asynchronism between decoder and generator, anharmonic 9.96 kHz subcarriers, and random amplitude and phase noise is also investigated. J.F.

A82-16564 **Design and performance of airborne radomes - A review.** G. A. E. Crone (ESA, European Space Research and Technology Centre, Noordwijk, Netherlands), A. W. Rudge (ERA Technology, Ltd., Leatherhead, Surrey, England), and G. N. Taylor (Royal Signals and Radar Establishment, Malvern, Worcs., England). *IEE Proceedings, Part F - Communications, Radar and Signal Processing,* vol. 128, pt. F, no. 7, Dec. 1981, p. 451-464. 68 refs.

Radomes for airborne amplification can be classified as either (1) large aircraft radomes of the nose-cone or under-fuselage type, (2) small aircraft radomes flush-mounted to the airframe, or (3) missile radomes. The geometry of the radome often leads to severe degradation of the electrical performance of any enclosed antenna. The requirement for a good aerodynamic shape is shown to influence the electromagnetic design of the radome, and the choice of dielectric materials is limited by the needs for structural strength, low weight, thermal stability, and rain erosion resistance. The radome performance may also be compromised by the scattering of electromagnetic waves from metallic pilot tubes and lightning protection strips outside the radome, as well as dielectric pressure tubes within it. The electromagnetic design of the three types of radomes are reviewed, sources of degradation of the enclosed antenna radiation pattern are examined, and the design requirements of the radomes, with respect to their operational environment, are discussed. J.F.

A82-16692 **A method for predicting the lifetime of gas turbine blades.** H. Policella and J.-P. Culié (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *Fatigue of Engineering Materials and Structures,* vol. 4, no. 2, 1981, p. 157-172. 17 refs.

The article describes a method developed at ONERA for predicting the lifetime of gas turbine blades. This method makes use of non-linear viscoplastic constitutive laws, the problem being solved from a plane cross section assumption and through a time-step linearization. The initiation of the first macroscopic crack is calculated from a stabilized cycle condition. A blade test rig has been developed for checking the method under load and temperature conditions that are as close as possible to operational ones. The results of two series of test on convection cooled IN100 blades prove the method to be acceptable to design engineers. (Author)

A82-16734 Technological innovation for success - Liquid hydrogen propulsion. J. L. Sloop (International Consultants on Energy Systems, Bethesda, MD). In: Between Sputnik and the Shuttle - New perspectives on American astronautics. San Diego, CA, Univelt, Inc., 1981, p. 225-239. 23 refs.

Hydrogen produces the highest exhaust velocity of all chemical fuels, thus producing the highest rocket velocities, but also has a low density, only one-quarter that of water. The development of hydrogen as a rocket fuel was begun in the early 1900s, though experiments were few due to the difficulty of obtaining liquid hydrogen. Para- and orthohydrogen were discovered in 1926, and catalysts to prevent the natural conversion of para to ortho, which tended to boil away liquefied hydrogen, were invented in the 1950s. Rocket testing using liquid hydrogen began in the 1940s, and the demand for liquid hydrogen increased for testing of thermonuclear weapons, although the supply of LH did not grow until the possibility for its use as a fuel for high altitude reconnaissance planes was investigated. Once NASA was created, the progress of an LH fueled stage for the Atlas rocket accelerated LH research, and led to NASA control of the development of the Saturn CV launch vehicle. An alternative use of liquid hydrogen as an automotive fuel is indicated. M.S.K.

A82-16746 Noise control measures in the new Singapore International Airport. R. B. W. Heng (National University of Singapore, Kent Ridge, Singapore). *Applied Acoustics,* vol. 14, Nov.-Dec. 1981, p. 439-453. 9 refs.

Noise control designs for the passenger terminal building of the Singapore International Airport are discussed. Three internal noise level areas were defined: noncritical public areas, general office areas, and conference rooms and the VIP lounge. Overall facade sound insulation comprised 27 mm of laminated glass. Rockwool blankets and perforated metal sheets were used in ceilings to lower reverberation levels in public areas. All contracted components were laboratory tested as a quality control procedure. Sound insulation requirements ranged from 32-45 dB, including doors, and an articulation loss level of 20% was set as a maximum for the distributed speaker public address system. M.S.K.

A82-16800 Grumman Tomcat - In a class of its own. R. M. Braybrook. *Air International,* vol. 22, Jan. 1982, p. 23-30.

Design, performance, and operational features of the F-14A Tomcat fighter are discussed. The validity of the variable geometry wings was established by NASA in wind tunnel tests which defined hinge points far enough away from the fuselage to stabilize the aerodynamic center in its rearward movement during a swept back mode. The Tomcat has a maximum mission weight of 70,426 lb with six Phoenix missiles, a maximum speed over Mach 2, can take off in 1300 ft, and land at 122 kt in 2000 ft. The wings sweep from 20-68 deg, roll is provided by differential tailplane movements, and the plane flies with no angle-of-attack restrictions. The weapons and target detection systems are described, noting the presence of an IR sensor to offset radar deficiencies in a jamming environment. Future versions of the F-14 will feature television for long range visual target identification, an improved Phoenix missile with longer range and better target resolution in a cluttered environment, and an expanded computer radar memory. M.S.K.

A82-16901 # Experience with high performance V/STOL fighter projects at MBB. F. Aulehla and G. K. Kissel (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2614.* 16 p. 9 refs.

Flight control systems and aerodynamic aspects of experimental V/STOL aircraft are discussed. The VJ 101 C featured tilting engines for increased thrust, reheat for takeoff, simple translation, triangular decentralization of the engines for thrust modulation, and moderate ground effects. Two experimental aircraft were built, with and without reheat, capable of Mach 2 and Mach 1.04, respectively. The mechanical flight control system and tests are outlined, both for hover rig and flight configurations. Ground suction, acoustic and thermal loading, sodium silicate coatings to avoid ground corrosion, and recirculation are considered. Results of the follow-on project to the VJ 101 C, the AVS, which was developed by NASA, are reviewed, and it is noted that trends toward thrust-to-weight ratios exceeding one, in concert with low wing loading, favor the development of V/STOL aircraft. M.S.K.

A82-16902 * # A summary of V/STOL inlet analysis methods. D. P. Hwang and J. H. Diedrich (NASA, Lewis Research Center, Cleveland, OH). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2628.* 8 p. 21 refs.

Methods to analyze the aerodynamic performance of V/STOL inlets at the NASA Lewis Research Center are discussed with emphasis on recent extensions and applications. Methods include the specification of the Kutta condition for a slotted inlet, the calculation of suction and tangential blowing for boundary layer control, and the analysis of auxiliary inlet geometries at angles of attack. An optimum diffuser velocity distribution is also developed, which can result in the shortest no-boundary layer control inlet and the lowest loss for the required amount of diffusion. D.L.G.

A82-16903 # Development and validation of the V/STOL aerodynamics and stability and control manual. C. Henderson and M. M. Walters (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2611.* 8 p. 13 refs.

A V/STOL Aerodynamics and Stability and Control Manual was developed to provide prediction methods which are applicable to a wide range of V/STOL configurations in hover and transition flight, in and out of ground effect. Propulsion-induced effects have been combined with unpowered aerodynamics in a buildup of total forces and moments for the jet-lift concept, so that total aerodynamics can be used to predict aircraft stability, control, and flying qualities characteristics. Results of longitudinal aerodynamic predictions have been compared with test data, and indicate that the methods are fast, inexpensive, and within the desired accuracy for the objective preliminary design stage. D.L.G.

A82-16904 # A summary of jet-impingement studies at McDonnell Douglas Research Laboratories. W. W. Bower, K. R. Saripalli, and R. K. Agarwal (McDonnell Douglas Research Laboratories, St. Louis, MO). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2613.* 13 p. 12 refs. Contracts No. N00014-76-C-0494; No. N00014-79-C-0836.

It has been the primary objective of the considered studies to determine and describe, through calculation, measurement, and visualization of the flowfields, the basic character of isolated and interacting impinging jets. The secondary objective has been to provide computed and experimental flow properties which can be used in the development and verification of empirically based prediction methodologies for complex aircraft configurations. The studies have resulted in the solution of the Reynolds-averaged Navier-Stokes and Jones-Launder turbulence model equations for two- and three-dimensional configurations and in the acquisition of an extensive data base and flow-visualization photographs for these configurations. C.R.

A82-16905 # An investigation of the use of a propulsive wing/canard concept for improved maneuvering. V. R. Stewart (Rockwell International Corp., Columbus, OH). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2622.* 9 p.

The propulsive wing concept is an extension of the flap boundary layer control utilized on several aircraft configurations. Several studies have been made regarding the benefits of the propulsive wing in STOL operation. However, the propulsive wing/canard provides performance benefits also in areas other than STOL. It is expected to improve the maneuvering capability by providing reduced drag at high lift coefficients without appreciable singular thrust control and the optimal junction of different subarcs are analyzed. It is noted that with the normalizing of the control variables, that is, the thrust-to-weight ratio, the bank angle, and the load factor, the results can be applied to any supersonic aircraft. C.R.

A82-17907 # **An application of invariance principle to pilot model for NT-33 aircraft with variable coefficients and delays.** A. S. C. Sinha (Purdue University, Indianapolis, IN). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0367*. 7 p. 13 refs. Contract No. F49620-79-C-0038.

A method is presented for analyzing pilot-induced oscillations (PIO) for the NT-33 closed-loop pilot model when retardations and coefficients are not constant. The variation of retardations and coefficients results from the effect of wind shear and the neuromuscular dynamics of the pilot reported in available data. Nonlinearities in the model are also considered. The method is based on the use of a new description of such systems in terms of convolution equations. Spectral factorization is applied to the entire functions of exponential order. The result is a criterion for the PIO-system with variable coefficients and variable delays. The criterion assumes continuity and boundedness of the coefficients and delays. A Lyapunov functional is constructed which gives a criterion on the roots of a certain 'quasi-polynomial,' i.e., a polynomial in a variable and the exponential of that variable. The largest domain of attraction is obtained from the Invariance Principle. (Author)

A82-17908 # **Flutter mode suppression using hyperstable feedback.** G. L. Slater (Cincinnati, University, Cincinnati, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0368*. 11 p. 9 refs.

The stability properties of hyperstable systems are explained and a synthesis procedure for multivariable feedback control laws is formulated and applied to the flutter control problem. The feedback controller is determined by: (a) constructing a state variable feedback law using a simplified model of the actual system dynamics, and (b) constructing a Luenberger observer for this system where the observer gain matrix is determined based on the hyperstable criterion. The procedure is applied to two design cases, one which is open-loop stable and the second which is open loop unstable. Results indicate that the hyperstability conditions can be utilized conveniently to develop a stable, robust elastic mode suppression system. (Author)

A82-17909 * # **The residue-measure criterion for model reduction in the analysis of the NASA Space Shuttle's digital flight control system.** D. P. Gluch (Honeywell, Inc., Clearwater, FL). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0369*. 9 p. 8 refs. Research supported by the Honeywell, Inc., Rockwell International Corp., and NASA.

A residue-measure criterion model reduction technique is applied to the vehicle dynamics model used in the design and analysis of the NASA Space Shuttle's digital flight control system. As implemented in this study the residue-measure technique involved an a priori residue calculation with control system biasing. The predictions of the reduced model are compared to vehicle level dynamic stability test data. These comparisons show an excellent correlation of the dominant spectral and response features between the model and test data. In addition, the application of the reduction technique to various Shuttle mission flight phases is demonstrated. (Author)

A82-17910 # **Target acceleration modeling for tactical missile guidance.** P. L. Vergez (USAF, Armament Laboratory, Eglin AFB, FL). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0370*. 13 p. 8 refs.

This paper addresses the critical problem of estimating the missile-to-target position, velocity, and acceleration (required by the linear optimal guidance law) when only passive (angle only) seeker information is available on-board a highly maneuverable bank-to-turn missile concept. More specifically, the problem is how to model the target acceleration to achieve improved missile performance. Four target acceleration models coupled with an extended Kalman filter are presented and evaluated on a six degree-of-freedom missile simulation to determine their estimation effectiveness and their influence on missile guidance. (Author)

A82-17911 # **Performance considerations in the design of subsonic cruise missiles.** R. L. Hanson and M. H. Kiehle (Boeing Aerospace Co., Seattle, WA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0371*. 11 p.

The recent introduction of advanced radar-controlled defenses to the territory of potential enemies has altered the requirements of both strategic and tactical cruise missiles, which have previously included only low specific fuel consumption and low vehicle weight. After a historical survey of cruise missile design practices, and an assessment of the capabilities of the current Harpoon, ALCM and Tomahawk systems, consideration is given to the impact of cruise missile radar cross section (RCS) and infrared signature in the emerging enemy defenses scenario. It is shown that the avoidance of fuselage, wing and control surface configurations with sharp points and tips that increase RCS leads to deltoid and saucer-like designs whose aerodynamic characteristics are not strictly in keeping with the efficient, high-speed cruise requirement. The construction of airframes from radar-absorbing materials is recommended. O.C.

A82-17912 # **An aerodynamic and signature shaping technique for developing advanced supersonic missile concepts.** R. J. Krieger (McDonnell Douglas Astronautics Co., St. Louis, MO). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0373*. 10 p. 13 refs.

A technique has been developed for optimizing the aerodynamic and signature characteristics of advanced, non-circular supersonic missile concepts. Sensitivity equations which guide configuration shaping are derived for the aerodynamic coefficients of axial force, normal force, pitching moment and lift-to-drag ratio; and for the signature characteristics of radar cross section and shadowing of surfaces. The implementation of the procedure in the computer aided design process is presented. Characteristics of the resulting shapes are verified by comparison with wind tunnel and high range resolution radar data. Applications are given for forebodies, boattail/base/nozzle integration and a complete configuration. (Author)

A82-17919 # **Viscous flow - Nemesis of the theoretician in pursuit of higher order accuracy.** L. E. Ericsson (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0389*. 13 p. 60 refs.

A review of viscous flow effects shows that the effects of large regions of separated flow on the vehicle dynamics cannot be mistaken for higher order inviscid flow effects because of their magnitude and nature. The effects of a thick boundary layer or of a small local separated flow region is less drastic; they may often be mistaken for a higher order inviscid flow effect. It is noted that because viscous effects are often large, even for attached hypersonic flow, great care is needed when comparing inviscid theory with experiment. An example is furnished by the effect of nose bluntness on slender cone unsteady aerodynamics. It is thought that for the foreseeable future the only practical means of obtaining the full scale unsteady viscous flow characteristics will be by the interactive use of experimental and theoretical results to obtain 'dynamic solution through analytic extrapolation'. C.R.

A82-17920 # **Evaluation of supersonic missile aerodynamic prediction techniques.** J. E. Williams (McDonnell Douglas Astronautics Co., St. Louis, MO). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0390*. 12 p. 30 refs.

Qualitative and quantitative analyses performed by comparing predictions with test data, and evaluating method accuracy according to a novel criterion, are presented for the case of ten methods used in the prediction of missile aerodynamic characteristics at supersonic speeds. It is found that: (1) while adequate predictions can be obtained for missile configurations in the conventional, airbreathing, and cruise missile classes, improvements are needed to address the lifting-body missile class; (2) of the two method categories considered, component-buildup and paneling techniques, that composed of methods employing configuration component-buildup may be enhanced by existing techniques that would result in greater accuracy or capability; and (3) the Datcom, NSWC, Missile 2, Aerodyn, and S/HABP component-buildup methods are found useful in the complete longitudinal aerodynamic analysis of missiles. O.C.

A82-17928 # **The feasibility of turnback from a low altitude engine failure during the takeoff climb-out phase.** B. W. Jett (U.S. Naval Academy, Annapolis, MD). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0406.* 12 p.

A new procedure is proposed for responding to engine failures in single-engine aircraft that occur at a low altitude during the takeoff/climb-out phase of flight. The procedure involves a 180-deg turn back to the vicinity of the airfield. Here, the pilot must find the optimum bank angle and airspeed for the turn; this can be done by applying aerodynamic principles to a steady state power-off gliding turn. The feasibility of this maneuver is investigated here by testing a wide range of pilots under controlled conditions using a variable stability flight simulator. It is noted that the theoretical optimum bank angle and airspeed can also be verified experimentally. Data are acquired in real time during the test flights using an automated, computer-controlled data acquisition system. The combination of theoretical analysis and experimental data yields an optimum procedure for a turn back to the airfield and demonstrates that the maneuver is within the capability of a typical private pilot. C.R.

A82-17930 # **Experimental structural testing on a composite aircraft canard and its applications.** K. S. Caldwell, Jr. (Texas, University, Arlington, TX). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0409.* 9 p.

This paper presents the results and discussion of several structural tests performed on the canard of The University of Texas at Arlington's experimental aircraft, the Varieze. From various tests the influence and the c-cubed coefficients of the bending and twisting matrixes were obtained. From these results one can accurately determine the bending and twisting of the canard that will result for any force and moment applied. Applications of these coefficients to graphics computers and swept-wing design are discussed. Two canards that were failed to destruction due to an excess bending load are also discussed, documenting radical structural differences in the final homebuilt products when both canards employed the same amount of material and were constructed from the same set of plans. (Author)

A82-17931 # **High temperature in situ experimentation in HVEM instrumentation and application to materials science.** R. Valle, B. Genty, A. Marraud (CNRS and ONERA, Laboratoire de Microscopie THT, Châtillon-sous-Bagneux, Hauts-de-Seine, France), and J. Cadoz (CNRS, Laboratoire de Physique des Matériaux, Meudon, Hauts-de-Seine, France). *ONERA, TP* no. 1981-77, 1981. 5 p.

The design and construction of high temperature specimen holders for experimentation on superalloys and ceramics is discussed. A double tilting holder, a double tilting straining holder, and the composition and surface finishes are described. The holders can withstand up to 1500 K, using optically smooth tungsten jaws held in a golden molybdenum tip. Gold-coated shield, either tantalum or silica, have been chosen because of low emissivity when used as thermal shields, in addition to the mechanical property of remaining flat at elevated temperatures. A heating system has been devised comprising tungsten heating elements radiating in long holes machined directly in the jaws. Mention is made of experiments already performed on NiO single crystals at 1400 K. M.S.K.

A82-17932 # **Highlights of a design concept for a close ground support fighter.** D. J. Dacquino (Lockheed-California Co., Burbank, CA) and R. J. Raffaele (Arizona State University, Tucson, AZ). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0411.* 12 p. 9 refs.

The design concept makes use of recent technological developments in order to improve payload and endurance capabilities. The preliminary design is based on a study of gross weight, airfoil and wing design, weight and balance, and performance analysis. A computer simulation of such standard performance requirements as takeoff and initial climb, climb performance, and range and endurance indicates a successful integration of these techniques. C.R.

A82-17934 # **Pressure distribution on an ogee wing in supersonic flow.** M. E. Vaughn, Jr. (Auburn University, Auburn, AL). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0414.* 11 p. 22 refs. Research sponsored by Auburn University; Grant No. DAAG29-78-G-0036.

An approximate method is developed which extends pressure distribution theories for wings of constant sweep to wings with curvilinear leading edges. Two cases are considered. In the first case of a predominantly subsonic leading edge, and analogy is made to a wing in conical flow. In the second case of a supersonic/subsonic leading edge, physical reasoning is used to approximate the flow regions on the wing with line-source solutions. An application is made to a wing of ogee planform and comparisons with experimental data prove very favorable. Each case typically required under 7 seconds of computer time (IBM 3031). (Author)

A82-17936 * # **The effect of non-linear propagation in jet noise.** J. A. Gallagher. *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0416.* 9 p. 10 refs. Grant No. NAG1-10.

An experimental investigation of the nonlinear propagation effects which occur in the noise radiated from low and moderate Reynolds number supersonic jets has been performed. An array of three condenser microphones was used to measure the waveforms propagated by axisymmetric, cold model jets of Mach numbers 2.1 and 2.5. Relatively low Reynolds numbers were obtained by exhausting the jets into a low pressure anechoic test chamber. The results show that phenomena normally associated with nonlinear acoustic propagation, such as wave steepening, harmonic generation and wave merging, are measurable in the high speed model jets. (Author)

A82-17951 **Flight mechanics - Modern aircraft design and control concepts (Flugmechanik - Moderne Flugzeugentwurfs- und Steuerungskonzepte).** X. Hafer (Darmstadt, Technische Hochschule, Darmstadt, West Germany) and G. Sachs (München, Hochschule der Bundeswehr, Munich, West Germany). Berlin, Springer-Verlag, 1980. 282 p. 199 refs. In German. $34.26.

The state-of-the-art of aircraft design and control concepts are presented. Design features of aircraft of natural and artificial stability are discussed, with emphasis on the tail unit, trim drag and maximum lift, as well as the dynamics of unregulated, unstable aircraft. Various aspects of direct force control are then outlined: direct lift control, direct side force control, and direct drag control. Finally, other possible uses for active control technology are discussed, including artificial lateral stability, automatic maneuvering flaps, variable cambers, maneuver load control for large aircraft, gust load alleviation, and active flutter suppression. J.P.

A82-18021 # **Responses of oscillating wings in weak shear flow.** A. Sasaki (Mitsubishi Electric Co., Ltd., Amagasaki, Japan) and M. Kobayakawa (Kyoto University, Kyoto, Japan). *Japan Society for Aeronautical and Space Sciences, Transactions,* vol. 24, Nov. 1981, p. 139-151. 10 refs.

In this paper, a theory on wings which are oscillating in a weak shear flow is presented. The potential lifting surface theory is extended to the shear flow case by successive approximations. An integral equation is derived by the singularity method to the first order approximation, and it is solved numerically by the mode function method. For examples of calculations, oscillating wings with heaving and pitching modes in a shear flow are treated. Generalized forces which can easily be related with unsteady lift forces and moments are obtained. Results show that the shear flow decreases all forces in amplitudes, and moreover, a slight phase-lag and a phase-lead appear in heaving and pitching oscillations, respectively. (Author)

A82-18022 # **A contribution to the hodograph method for shock-free transonic airfoil sections.** T. Shigemi (National Aerospace Laboratory, Tokyo, Japan). *Japan Society for Aeronautical and Space Sciences, Transactions,* vol. 24, Nov. 1981, p. 152-168. 13 refs.

Hovering helicopters accumulate excessive charge as a result of triboelectrification, surrounding space charge, and external electric fields that result in high electrostatic potentials on the aircraft. Electrostatic energy stored on the helicopter can cause electrical discharges to occur from the cargo hook when contact is made with the ground or ground personnel. Laboratory model studies were conducted under electrostatic conditions simulating hovering aircraft to show that on-board instrumentation capable of measuring electric field intensity and charge density can provide the basis for indirectly inferring the correct potential relative to ground of a spherical model test body. Potential of the model was inferred for three cases involving electrostatic instrumentation located (1) on the ground below the model, (2) installed at the south pole of the model, and (3) mounted at the end of the simulated cargo hook. Analysis of laboratory test data resulted in empirical derivations of unique electric field curves for each of the three cases studied. The first two cases were also studied analytically by solving Poisson's equation for a sphere between two parallel plates, and the mathematical expressions substantiated the laboratory results. Methodology for developing a full-scale helicopter electrostatic discharger system to eliminate hazardous potentials on helicopter aircraft is described.

GAS TURBINE CERAMIC-COATED-VANE CONCEPT WITH CONVECTION-COOLED POROUS METAL CORE

Albert F. Kascak (AVRADCOM Research and Technology Labs., Cleveland), Curt H. Liebert, Robert F. Handschuh, and Lawrence P. Ludwig Dec. 1981 14 p refs Sponsored in part by U.S. Army Aviation Research and Development Command, St. Louis
(NASA-TP-1942; AVRADCOM-TR-81-C-7; E-732) Avail: NTIS HC A02/MF A01 CSCL 21E

Analysis and flow experiments on a ceramic-coated-porous-metal vane concept indicated the feasibility, from a heat transfer standpoint, of operating in a high-temperature (2500 F) gas turbine cascade facility. The heat transfer and pressure drop calculations provided a basis for selecting the ceramic layer thickness (to 0.08 in.), which was found to be the dominant factor in the overall heat transfer coefficient. Also an approximate analysis of the heat transfer in the vane trailing edge revealed that with trailing-edge ejection the ceramic thickness could be reduced to (0.01 in.) in this portion of the vane. WIND TUNNEL TESTS OF ENGINE-EQUIPPED MODELS: COMPARISON OF TWO JET WASH SIMULATION METHODS

J. P. Becle and R. Perin Dec. 1981 43 p ref Transl. into ENGLISH of 'Essais en Soufflerie de Maquetter Motorisees. Comparison de Deux Methodes de Simulation des Jets des Reacteurs'' rept. T.P. 1981-42, France, 1981 p 1-18 Presented at the AGARD/FDP Symp. Aerodynamics of Power Plant Installation, Toulouse, 11-14 May 1981 Original language document was announced as A81-39245 Transl. by Scientific Translation Service, Santa Barbara, Calif. Original doc. prep. by ONERA, Toulouse
(Contract NASw-3542)
(NASA-TM-76764; TP-1981-42) Avail: NTIS HC A03/MF A01 CSCL 21E

The optimization of performance factors in state of the art civil aircraft was studied by using powered models in wind tunnels. In cooperation with ONERA, two methods of cold simulation of jet engine washes were developed. The first, called 'blown jet', benefitted from the previously perfected test set-ups made for studies of the CONCORDE. The second, which utilized small air-turbines, were recently put into operation for the AIRBUS family of aircraft. The facilities, the measurement equipment and the methods of exploiting the results are described. The relative value of each of the methods of motorization is analyzed: complexity of equipment, duration, precision of measurements and comparison of results are also discussed. A.R.H.

THE USE OF OPTIMIZATION TECHNIQUES TO DESIGN CONTROLLED DIFFUSION COMPRESSOR BLADING

Nelson L. Sanger 1982 18 p refs Proposed for presentation at the 27th Ann. Intern. Gas Turbine Conf., London, Apr. 18-22, 1982; sponsored by ASME
(NASA-TM-82763; E-1084) Avail: NTIS HC A02/MF A01 CSCL 21E

A method for automating compressor blade design using numerical optimization, and applied to the design of a controlled diffusion stator blade row is presented. A general purpose optimization procedure is employed, based on conjugate directions for locally unconstrained problems and on feasible directions for locally constrained problems. Coupled to the optimizer is an analysis package consisting of three analysis programs which calculate blade geometry, inviscid flow, and blade surface boundary layers. The optimizing concepts and selection of design objective and constraints are described. The procedure for automating the design of a two dimensional blade section is discussed, and design results are presented. E.A.K.

POLLUTION REDUCTION TECHNOLOGY PROGRAM SMALL JET AIRCRAFT ENGINES, PHASE 3 Final Report

T. W. Bruce, F. G. Davis, T. E. Kuhn, and H. C. Mongia Dec. 1981 180 p refs
(Contract NAS3-20819)
(NASA-CR-165386; AiResearch-21-3615) Avail: NTIS HC A09/MF A01 CSCL 21E

A series of Model TFE731-2 engine tests were conducted with the Concept 2 variable geometry airblast fuel injector combustion system installed. The engine was tested to: (1) establish the emission levels over the selected points which comprise the Environmental Protection Agency Landing-Takeoff Cycle; (2) determine engine performance with the combustion system; and (3) evaulate the engine acceleration/deceleration characteristics. The hydrocarbon (HC), carbon monoxide (CO), and smoke goals were met. Oxides of nitrogen (NOx) were above the goal for the same configuration that met the other pollutant goals. The engine and combustor performance, as well as acceleration/deceleration characteristics, were acceptable. The Concept 3 staged combustor system was refined from earlier phase development and subjected to further rig refinement testing. The concept met all of the emissions goals. E.A.K.

ERBS FUEL ADDENDUM: POLLUTION REDUCTION TECHNOLOGY PROGRAM SMALL JET AIRCRAFT ENGINES, PHASE 3 Final Report

T. W. Bruce, F. G. Davis, T. E. Kuhn, and H. C. Mongia [1982] 47 p refs
(Contract NAS3-20819)
(NASA-CR-165387; AiResearch-21-3619) Avail: NTIS HC A03/MF A01 CSCL 21E

A Model TFE731-2 engine with a low emission, variable geometry combustion system was tested to compare the effects of operating the engine on Commercial Jet-A aviation turbine fuel and experimental referee broad specification (ERBS) fuels. Low power emission levels were essentially identical while the high power NOx emission indexes were approximately 15% lower with the EBRS fuel. The exhaust smoke number was approximately 50% higher with ERBS at the takeoff thrust setting; however, both values were still below the EPA limit of 40 for the Model TFE731 engine. Primary zone liner wall temperature ran an average of 25 K higher with ERBS fuel than with Jet-A. The possible adoption of broadened proprties fuels for gas turbine applications is suggested. E.A.K.

OPTIMIZATION OF COMPRESSOR VANE AND BLEED SETTINGS Final Report, May 1979 - May 1981

J. E. Garberoglio, J. O. Song, and W. L. Boudreaux Wright-Patterson AFB, Ohio AFWAL Jun. 1981 83 p refs
(Contract F33615-79-C-2018; AF Proj. 2307)
(AD-A108059; PWA-FR-14487; AFWAL-TR-81-2046) Avail: NTIS HC A05/MF A01 CSCL 21/5

This report evaluates optimization methods for their effectiveness in relating multistage axial compressor test data to the decision to vary a selected vane or bleed to reach a predetermined performance goal. Compressor simulations were used in a comparative evaluation and each method was judged on the basis of the number of tests required to achieve an optimum performance goal. The influence of measurement errors and finite vane travel were also prime considerations. Based on this evaluation, the COPES/CONMIN approximate optimization technique was chosen most suitable. The Fluids, Lubricants, and Elastomers Branch of the Materials Laboratory, AFWAL, established the requirements for a MIL-L-7808H operational oil with corrosion inhibition characteristics at least equal to those of MIL-C-8188C. The new oil formulation is to provide corrosion inhibition under long-term storage conditions of the ALCM F107 turbine engine. During the initial fifteen-month effort, several approaches were evaluated as candidate methods for determining the effectiveness of corrosion inhibiting oil additives. A screening procedure was developed after preliminary modifications were made to the Corrosion Rate Evaluation Procedure (CREP). Using the CREP together with compatibility and miscibility screening of oil/inhibitor blends, a total of 67 candidate corrosion inhibitors (CCI) were evaluated. These included CCI obtained from Bray Oil Company, El Monte, California, as part of a subcontract to synthesize candidate corrosion inhibitors. Additional tests were completed on a preliminary physical and chemical property evaluation of the oil/inhibitor blends in regard to MIL-L-7808H and MIL-C-8188C specifications. GRA

MLS VERTICAL GUIDANCE AND NAVIGATION FOR A STOL AIRPLANE LANDING ON AN ELEVATED STOLPORT
David N. Warner, Jr. Nov. 1981 27 p refs
(NASA-TM-81338) Avail: NTIS HC A03/MF A01 CSCL 01C

In contrast to CTOL landing operations, STOL airplanes landing on short STOLport runways typically begin the flare maneuver before reaching the runway surface. Vertical guidance procedures were developed to allow an autoland flight control system for a STOL airplane to use Microwave Landing System (MLS) signals as altitude and sink rate references for flare initiation, with a transition to radar altimeter after the airplane is over the runway. The implementation has minimum impact on the control system and landing performance. Data are presented which show validation of the concepts in a simulator. Author

THE DESIGN OF A JET CATCHER
K. G. Winter and L. F. East Feb. 1981 11 p refs
(RAE-TM-AERO-1891; BR78882) Copyright. Avail: Issuing Activity

A device for catching and dissipating the kinetic energy of a jet used in a boundary layer tunnel to eliminate unwanted air currents is described. A dished front face and a large outlet catch the jet, avoiding spillage, and pass it through a screen set normal to the flow in order to reduce kinetic energy. The screen is inclined so as to take advantage of refraction. An additional muslin screen reduces noise. Final outlet velocity is 1/8 of the jet velocity, although there is slight spillage. Author (ESA)

N82-14103 Royal Aircraft Establishment, Farnborough (England).
AN AFTERBODY DRAG BALANCE
A. G. Kurn Mar. 1981 12 p ref
(RAE-TM-AERO-1887; BR78348) Copyright. Avail: Issuing Activity

A strain gage drag balance was made to fit into the jet blowing rig in a transonic wind tunnel. Differences in the drag of various axisymmetric boattailed afterbodies surrounding an engine exhaust nozzle were determined. Three sets of four flexures are spaced equally along the x axis, with strain gages on the middle set. The gages on the center flexures form bridges, compensated for thermal induced drift. Calibration shows that signals are linear with drag force. Output signals can be monitored from two separate strain gage circuits. The device can withstand components of force and moment that might be applied during model assembly. Drag values up to 20N can be measured. Author (ESA)

STUDY OF FIBER OPTICS TO ENHANCE AN ENVIRONMENTAL LIGHTING LABORATORY Final Report, Nov. 1979 - Mar. 1981
J. Connelly Wright-Patterson AFB, Ohio AFWAL Aug. 1981 154 p Prepared in cooperation with Galileo Electro-Optics Corp., Sturbridge, Mass.
(Contract F33615-79-C-3629; AF Proj. 2403)
(AD-A106117; AFWAL-TR-81-3098) Avail: NTIS HC A08/MF A01 CSCL 13/1

This report documents the results of an investigation to determine how fiber optic materials can be utilized to substantially increase the simulation capabilities of an Environmental Lighting Laboratory. This Laboratory must provide the capability to dynamically simulate the ambient environmental illumination conditions encountered in day, night and high threat/high risk aircraft missions. Three cockpit lighting simulator concepts were studied. Two of these concepts utilized a spherical lighting enclosure with a visual scene being projected at the inner surface via a remote projection input surface; fiber optics carry the image from input surface to output surface. In one concept, the pilot views a back-projected image on a translucent spherical screen via a spherical output surface with imbedded fiber optics. In the other concept, the pilot views the spherical fiber optic output surface directly. Both concepts were considered possible to implement, each concept having appropriate cost vs. performance tradeoffs. No useful solution was found using the third concept, a fiber optic input to mirrored ellipsoidal enclosure. It was found that the spherical enclosure concept with an internal translucent projection screen offers the best combination of illumination level and resolution; however, the cost of implementing this concept is substantial. DETERMINATION OF SELECTED DISTILLATE BLENDING SOLVENTS IN SIMPLE AND COMPLEX AIRCRAFT FUEL MATRICES VIA GLASS CAPILLARY GAS CHROMATOGRAPHY Final Report, Jan. - Dec. 1979
Paul C. Hayes, Jr. Jun. 1981 44 p refs
(AF Proj. 3048)
(AD-A105586; AFWAL-TR-80-2082) Avail: NTIS HC A03/MF A01 CSCL 07/4

A study was initiated to accurately determine the volume percent of various hydrocarbon distillate solvents present in blends with aircraft jet fuels JP-4 and JP-8. These modified fuels were an integral part of a combustion program to elucidate the effect altered fuel properties had on selected combustion parameters. A method of analysis was desired to check the accuracy of both in-house and contractual blending work. The effort was further expanded to even determine the amount of JP-4 present in the event of gross cross-contamination. Author (GRA)

[illegible]

POLLUTION OF THE SOIL BY AVIATION GASOLINE

[illegible]

ROLE OF OPTICAL [illegible] CONTROL APPLICATIONS

[illegible]

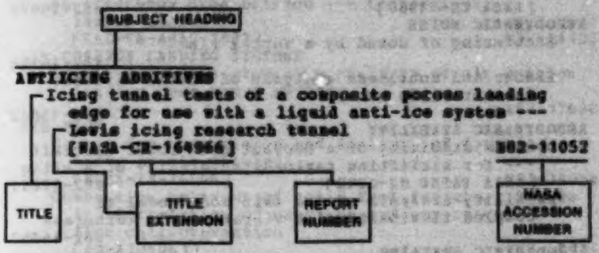
THE OPTICAL RECOGNITION OF SEA TARGETS AS A FUNCTION OF SURROUNDING AND OBSERVATION PARAMETERS IN AIR TO WATER OBSERVATIONS

[illegible]

SUBJECT INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 147)* **APRIL 1982**

Typical Subject Index Listing



SUBJECT HEADING
ANTIICING ADDITIVES
Icing tunnel tests of a composite porous leading edge for use with a liquid anti-ice system --- Lewis icing research tunnel
[NASA-CR-164966] N82-11052
TITLE
TITLE EXTENSION
REPORT NUMBER
NASA ACCESSION NUMBER

The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, a title extension is added, separated from the title by hyphens. The NASA or AIAA accession number is included in each entry to assist the user in locating the abstract in the abstract section of this supplement. If applicable, a report number is also included as an aid in identifying the document.

A

ACCELERATION (PHYSICS)
Take-off ground roll of propeller driven aircraft
A82-17607
Acceleration response of fuselage sidewall panels on a twin-engine, light aircraft
A82-18729

ACCELERATION PROTECTION
Advanced crash survivable flight data recorder and Accident Information Retrieval System (AIRS)
[AD-A105510] N82-14072

ACCIDENT PREVENTION
Why safety --- fuel conservation through aircraft safety
A82-17277
Accident prevention - A regulators view
A82-17278

ACOUSTIC ATTENUATION
Noise-Con 81; Proceedings of the National Conference on Noise Control Engineering, North Carolina State University, Raleigh, NC, June 8-10, 1981
A82-18726

ACOUSTIC PROPAGATION
The effect of non-linear propagation in jet noise
[AIAA PAPER 82-0416] A82-17936

ACOUSTIC SCATTERING
Scattering of sound by a vortex ring
A82-16148

ACOUSTIC VELOCITY
Taking into account nighttime annoyance in the calculation of the psophic index
[NASA-TM-76500] N82-14670

ACRYLONITRILES
Effects of elastomeric additives on the mechanical properties of epoxy resin and composite systems
A82-17538

ACTIVE CONTROL
Digital active control system for load alleviation for the Lockheed L-1011
A82-16187
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 1: Load alleviation/extended span development and flight tests
[NASA-CR-159097] N82-15076
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 2: AFT C.G. simulation and analysis
[NASA-CR-159098] N82-15077

ADAPTIVE CONTROL
Role of optical computers in aeronautical control applications
N82-15697

ADDITIVES
Effects of elastomeric additives on the mechanical properties of epoxy resin and composite systems
A82-17538

ADHESIVE BONDING
Aeronautical applications of bonding
[SNIAS-812-551-102] N82-15010

AERIAL RECONNAISSANCE
The optical recognition of sea targets as a function of surrounding and observation parameters in air to water observations
[BMVG-FBWT-81-10] N82-15930

AEROACOUSTICS
Workshop report for the AIAA 6th Aeroacoustics Conference

[NASA-TM-84079] N82-16022

RESEARCH FACILITIES
NASA Dryden Flight Loads Research Facility
[NASA-TM-81368] N82-15079

RESIN MATRIX COMPOSITES
Tensile fatigue assessment of candidate resins for use in fibre reinforced composite repair schemes
A82-17531

RESONANT FREQUENCIES
Application of the finite element method to the calculation of the modes and frequencies of natural vibrations of aircraft structures
A82-18612

RESONANT VIBRATION
Resonant whirling of aircraft propeller-engine systems
A82-16417
Stochastic control and identification of helicopter dynamic modes
[NASA-CR-165057] N82-15032

RESOURCE ALLOCATION
Management of a large avionics project
A82-16557

REYNOLDS NUMBER
Low Reynolds number airfoil survey, volume 1
[NASA-CR-165803-VOL-1] N82-14059

REYNOLDS STRESS
The structure of a separating turbulent boundary layer. I - Mean flow and Reynolds stresses. II - Higher-order turbulence results
A82-18776

RIGID STRUCTURES
Multilevel optimum design of structures with fiber-composite stiffened-panel components
[AIAA PAPER 80-0723] A82-17594

RING LASERS
Laboratory and flight test of a new RLG strapdown INS
A82-18150

ROLL
Development and trial of a rotary balance for the 3 m-low speed wind tunnels in the Federal Republic of Germany
[BMFT-FB-W-81-022] N82-15083

ROTARY GYROSCOPES
3 DOF gyro analysis from measured and derived rates --- hypersonic reentry simulation test
[AIAA PAPER 82-0189] A82-17831

ROTARY WINGS
A flight investigation of blade-section aerodynamics for a helicopter main rotor having 10-64C airfoil sections
[NASA-TM-83226] N82-14058
Flag-lag-torsional dynamics or extensional and inextensional rotor blades in hover and in forward flight

affecting the low lift drag. An increase in the buffet free load factor can also be expected with the blown wing and canard. Attention is given to a program to investigate the wing/canard at maneuvering conditions, and tests at ranges of blowing coefficients equivalent to STOL operation. G.R.

A82-16906 # Advanced technology airfoil development for the XV-15 tilt-rotor vehicle. J. C. Narramore (Bell Helicopter Textron, Fort Worth, TX). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2623.* 10 p. 15 refs.

Advances in the state-of-the-art of aerodynamics, dynamics, and structures suggest that the flight envelope of the tilt-rotor VTOL vehicle XV-15 can be expanded by an improved rotor blade design. A description is presented of an intensive airfoil development study which has been conducted in connection with the conceived possibilities. State-of-the-art design techniques were used to produce the new sections, and a wind tunnel 'fly-off' between the best airfoils was held. Advanced technology airfoils demonstrated significant improvements in aerodynamic characteristics compared to existing XV-15 blade airfoils. G.R.

A82-16907 * # Ground test of a large scale 'D' vented thrust deflecting nozzle. E. W. Rosenberg (McDonnell Aircraft Co., St. Louis, MO) and R. S. Christiansen (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2630.* 10 p.

Future V/STOL aircraft will require efficient techniques for changing the thrust vector from the vertical direction for VTOL operation to the horizontal direction for conventional flight. Most V/STOL concepts utilize thrust vectoring nozzles to provide this variation in the thrust vector direction. An experimental test program was initiated to demonstrate the capabilities of a large scale 'D' vented thrust deflecting system coupled with a high bypass ratio turbofan engine. Data were obtained for a 'D' vented nozzle mounted behind a YTF-34-F5 turbofan engine. Preliminary data are presented for a variety of test conditions. Attention is given to aspects of 'D' vented nozzle design, the test apparatus, engine-nozzle compatibility, exit area variation, longitudinal vectoring performance, nozzle temperature distribution, and large scale - small scale comparisons. G.R.

A82-16908 # NASA V/STOL Propulsion Control Analysis - Phase I and II program status. R. J. Miller, S. P. Roth, and W. B. Kerr (United Technologies Corp., Government Products Div., West Palm Beach, FL). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2632.* 11 p.

NASA-Lewis Research Center initiated the V/STOL Propulsion Control Analysis Program in 1979 in order to take advantage of advanced electronic control technology for the next generation of V/STOL aircraft. The rationale, methods, and criteria developed during Phase I and Phase II of the program are discussed first. The development of an integrated flight and propulsion control system is then described. Most V/STOL aircraft under consideration depend on reaction thrusters or separate lift engines for attitude control and on engine thrust variations for height control. S/CTOL aircraft vector-thrust for pitch control during low speed operation. The baseline propulsion control system provides a thrust level response of 10 rad/sec and a vectoring response of 22 rad/sec. The requirements of the control components include: (1) redundant electronic control computers with minimum software and 100% Fault Coverage; (2) prime reliable electromechanical actuator interfaces; (3) miniature, digitally compatible sensors with easily detected failure modes; and (4) dual element, fail operational fuel pumps. J.F.

A82-16909 * # V/STOL propulsion control technology. H. Brown (General Electric Co., Cincinnati, OH). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2634.* 10 p. Contract No. NAS3-22057.

Results of a NASA sponsored study of V/STOL Propulsion Control Analysis are presented. The study involved propulsion control requirements, design concepts and procedures, and control designs for supersonic V/STOL. A variable cycle engine with a remote augmented lift system was used as a basis for establishing typical operating requirements and control concepts, and a nonlinear engine model was developed for control development as a precursor to a real-time simulation capability. A simplified aircraft model was also used to investigate transition requirements, and a long-range technology plan was developed to define subsequent program requirements for achieving a real-time piloted simulation capability. D.L.G.

A82-16910 * # Piloted simulation of hover and transition of a vertical attitude takeoff and landing aircraft. G. C. Hill (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2636.* 8 p. 9 refs.

Piloted simulation studies of candidate control systems for VATOL aircraft were conducted on a six degree of freedom simulator. Hover and transitions from wing-born to hovering flight were performed, with and without turbulence, on a representative high performance fighter configuration. Deflection of the rear engine nozzle provided pitch and yaw control moments in concert with reaction controls for roll. Unique motion cues in hover result from the vertical displacement of the cockpit and the thrust vectoring nozzles. Abundant control power available with moderate engine nozzle deflection combined with rate feedback for stability augmentation provided very satisfactory control. (Author)

A82-16911 * # Thrust reversing effects on twin-engine aircraft having nonaxisymmetric nozzles. F. J. Capone, R. J. Re, and E. A. Bare (NASA, Langley Research Center, Transonic Aerodynamics Div., Hampton, VA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2639.* 15 p. 21 refs.

The effects of thrust reversing on stability, control and vertical tail loads of advanced fighter aircraft are reviewed. Several static test stand and wind tunnel investigations of nonaxisymmetric nozzles with integral thrust reversers are presented, and it is found that base drag on the aft face of reverser panels of blockers provides a significant contribution to in-flight thrust reverser performance. The location of tail surfaces relative to the thrust reverser has significant impact on control surface effectiveness, and depending on thrust reverser location, large vertical tail side force can result from the use of in-flight thrust reversers. It is concluded that highly effective nonaxisymmetric nozzle reversers can be designed to achieve a 50% static reverse thrust. D.L.G.

A82-16912 # Greenlandair VTOL transportation study. R. R. Reber (Bell Helicopter Textron, Fort Worth, TX). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2642.* 6 p.

An operational and economic analysis was conducted on Greenlandair, a large helicopter commuter operation. Results indicate that the airline could realize a significant increase in available seat miles with a decrease in total cost by replacing the fleet of helicopters and fixed-wing aircraft with Tiltrotors. The Tiltrotor can fly 2.5 times faster than the helicopters, and 25% faster than the presently used turboprop aicraft. Fuel consumption could be reduced by one half, and with additional savings on maintenance, crew costs, and ground support costs, plus expanded flight schedules, the airline could achieve a net yearly savings of over 2 million dollars. D.L.G.

A82-16913 # V/STOL status from the engine technology viewpoint. G. M. Lewis and W. J. Lewis (Rolls-Royce, Ltd., Bristol, England). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2648.* 10 p.

Directions for designs and powerplant configurations for V/STOL aircraft are explored. The Harrier is the only V/STOL aircraft in service, having performed for over 12 yr. Rolls-Royce has studied engines with powered lift separation from forward propulsion, and engines with composite lift/propulsion modes, resulting in concentration on vectored thrust using rotating or deflected nozzles. The necessity for higher combat performance creates a need for higher specific thrust for supersonic flight (Mach 2), which is achievable with plenum chamber burning. The core flows are exhausted through separate nozzle systems for independent control. Intake in a V/STOL follows a short path and results in nonuniform flow, and testing is described to account for the effects of nonuniform static pressures and temperatures. M.S.K.

A82-16914 *# **Helical helicopter approaches with microwave landing system guidance.** L. A. McGee, J. D. Foster, and D. C. Dugan (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2654.* 13 p. 8 refs.

It is desirable that the landing approach of helicopters and V/STOL aircraft into a congested airport equipped with a microwave landing system (MLS) can take place essentially independent of CTOL traffic. The helical approach has been proposed as one way to provide aircraft separation while requiring minimum airspace. A helical descent makes it possible for the helicopter to lose altitude in a confined airspace without descending along an excessively steep glide slope. This avoids helicopter handling problems which occur at slow airspeeds. Preliminary flight-test data are presented regarding the operational feasibility of the helical approach under IFR conditions where the primary guidance information is from an MLS. G.R.

A82-16915 # **Maintenance problems associated with the operation of the F402 /Pegasus/ engine in the AV-8A /Harrier/ aircraft.** C. W. Stanley and W. E. Hood (U.S. Navy, Cherry Point, NC). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2656.* 8 p.

The U.S. Marine Corp (USMC) has been operating the only V/STOL attack aircraft in the western world since 1971. Some of the maintenance problems experienced are related to the unique V/STOL design criteria of the Pegasus engine. However, the major part of the required maintenance effort is found to involve the more conventional engine problems. A description of the aircraft engine is provided and the problems resulting from V/STOL design demands are examined. Attention is given to the fuel system control, the engine air bleed, foreign object damage to the hp compressor, and the engine exhaust system. G.R.

A82-16916 # **A low cost maritime control aircraft-ship-weapons system.** H. Fluk (U.S. Naval Air Engineering Center, Lakehurst, NJ). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2660.* 10 p. 7 refs.

It is pointed out that the long-range antiship standoff missile is emerging as the foremost threat on the seas. Delivered by high speed bombers, surface ships, and submarines, a missile attack can be mounted against selected targets from any point on the compass. An investigation is conducted regarding the configuration of a system which could most efficiently identify and destroy standoff threats before they launch their weapons. It is found that by using ships for carrying and launching missiles, and employing aircraft with a powerful radar only for search and missile directing operations, aircraft cost and weight can be greatly reduced. The employment of V/STOL aircraft in preference to other types of aircraft makes it possible to use ships of smaller size for carrying the aircraft. However, in order to obtain an all-weather operational capability for the system, ships are selected which are still big enough to display the required stability in heavy seas. G.R.

A82-16917 # **Type 'A' V/STOL - One aircraft for all support missions.** W. H. Adelt (McDonnell Aircraft Co., St. Louis, MO). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2661.* 14 p. 5 refs.

An investigation is conducted regarding the feasibility of developing a single support aircraft type for the Navy, taking into account the current naval inventory of utility aircraft types. Support mission characteristics are examined, giving attention to antisubmarine warfare, airborne early warning, marine assault, carrier on board delivery/vertical on board delivery, the aerial tanker mission, long-range rescue, surface attack, and aspects of combat, search, and rescue. With the aid of a sample design for a V/STOL aircraft with a medium disc loading lift system it is demonstrated that it is now possible to design an aircraft which, with minor modifications, can meet the wide variety of support missions. G.R.

A82-16972 # **Airbus - Perspectives for the future (Airbus - Perspectivas para el futuro).** K. Schleicher Tafel (Construcciones Aeronáuticas, S.A., Madrid, Spain). *IAA/Ingeniería Aeronáutica y Astronáutica*, vol. 33, Nov. 1981, p. 5-16. In Spanish.

The derivation of future commercial aircraft in the 150-300 seat range from the A-300 and A-310 design, according to a staged program of development and technology transfer, is described. After brief consideration of the distribution of program responsibilities among the members of the Airbus consortium, and the derivation of the A-310 from the A-300, attention is given to the features of the A-300-600 series aircraft, which incorporates and A-310 rear fuselage and will replace the A-300 toward the end of 1984. Also considered are (1) the long-term replacements of the A-300 and A-310, the twin-aisle TA-9 and TA-11, respectively, and (2) the single- aisle A-320, which is to be a new design for the short-range market and the precursor of a new family of aircraft in the 125-175 seat range. The A-320 is compared to the 737, DC9 and 757 aircraft. O.C.

A82-16973 # **The justification of the need for ILS by means of cost/benefit methods (Justificacion de la necesidad de un ils mediante tecnicas costo/beneficio).** E. Lallemand Abella. *IAA/Ingeniería Aeronáutica y Astronáutica*, vol. 33, Nov. 1981, p. 33-38. In Spanish.

FAA criteria for the establishment of an Instrument Landing System (ILS) at a given airport have been applied since 1977 in light of cost/benefit studies. The criteria apply to airports with regular jet aircraft traffic which are open to use by general aviation aircraft, and are applicable to other airports in which (1) the number of yearly landing approaches under instrument-only control is greater than a minimum figure and (2) the cost/benfit ratio is better than unity. Attention is given to benefits both annually and in the long term, as well as investment and operating costs. Benefits are defined in terms of regularity of operations and the statistical reduction of accident rates. O.C.

A82-17118 # **A method for locating aircraft wing damage by nonlinear vibration analysis (Ob odnom metode poiska povrezhdenii kryla samoleta, osnovannom na analize ego nelineinykh kolebanii).** S. L. Tsyfanskii, V. M. Ozhiganov, A. B. Milov, and Iu. N. Novikii. *Voprosy Dinamiki i Prochnosti*, no. 39, 1981, p. 3-10. 7 refs. In Russian.

A procedure is proposed for the electrical modeling of the vibrations of a spar wing with a crack. A diagnostic technique based on the spectral analysis of ultraharmonic vibrations is described. V.L.

A82-17124 **Some aerodynamic aspects of hang gliding.** A. Fischer (Dortmund, Universität, Dortmund, West Germany). *Endeavour*, vol. 5, no. 4, 1981, p. 152-157.

Hang gliding began with experiments for spacecraft return to earth using delta wings for gliding. Manipulation of the steering bar on modern hang gliders is outlined, along with the high-strength, light-weight construction. The pointed nose of early gliders is actually suitable only for supersonic craft, and led to the addition of a permanently adjusted elevator to eliminate flap induced dive. Hang glider wings have a lift coefficient of one, a glide angle of 1:10, and a sink ratio of 0.9 m/sec. A progression toward elliptical wings is noted, and designs for semi-rigid and powered gliders are discussed. The addition of a motor leads to stability and thrust axis considerations as well as weight penalties and greater induced drag. Finally, ultralights are mentioned, including the Gossamer and the solar powered aircraft. M.S.K.

A82-17125 **Design procedures for compressor blades (Entwurfsverfahren für Verdichterschaufeln).** H. Starken (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Antriebstechnik, Cologne, West Germany). *DFVLR-Nachrichten*, Nov. 1981, p. 48-51. In German.

The conventional methods for the design of the blades in the case of axial turbomachines are considered, taking into account difficulties concerning the determination of optimal blade profiles. These difficulties have been partly overcome as a consequence of the

A simple method is developed for the design of transonic shock-free airfoil sections based on the analytical hodograph method. Traditional procedure is used in which a compressible flow is built up by transformation from an incompressible analog which is now called a model flow. In view of the defect in existing models such as a circular- or elliptic-cylinder, a new model, YC-profile, is introduced. (Author)

A82-18094 # **Results of a Differential Omega experiment.** T. M. Watt, L. E. Abrams, and F. G. Karkalik (Systems Control, Inc., Palo Alto, CA). In: Symposium on the Effect of the Ionosphere on Radiowave Systems, Washington, DC, April 14-16, 1981, Preprints. Washington, DC, U.S. Naval Research Laboratory, 1981. (4B-3). 12 p. 6 refs.

An experiment was performed to examine the utility of Differential Omega navigation for general aviation in Alaska and Northwest Canada, with emphasis on operational issues. The performance of a prototype Differential Omega system is evaluated for performance parameters such as maximum range of the data link, mean and variance of navigation error, and range decorrelation error. Mean error was observed to be about 0.5 NM, and the standard deviation error was about 0:25 NM. Ground tests yielded results that were consistent with results of earlier experiments, and random errors agreed well with the minimum range results. D.L.G.

A82-18117 **Introduction to V/STOL airplanes.** D. L. Kohlman (University of Kansas Center for Research, Inc., Lawrence, KS). Ames, Iowa State University Press, 1981. 242 p. 161 refs.

After a brief historical account of V/STOL aircraft requirements and experiments, consideration is given to (1) propulsion system devices, such as ducted propellers and augmenting ejectors, (2) operational problems, including ground effects and terminal area operations, (3) takeoff performance and equations for its description, (4) landing performance, relationships, equations and characteristics, and (5) the transition from hover to forward flight, including its equations of motion. Also covered are (6) blowing and suction boundary layer control and powered lift systems, such as jet flaps and blown flaps, propulsive wings and circulation-control airfoils, (7) stability and control in hover and handling qualities criteria, and (8) V/STOL propulsion considerations including number of engines and trends in speciafic fuel consumption and thrust-to-weight ratio. O.C.

A82-18126 **PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record.** Symposium sponsored by the Institute of Electrical and Electronics Engineers. New York, Institute of Electrical and Electronics Engineers, Inc., 1980. 511 p. Members, $25.; nonmembers, $37.50.

Aspects of satellite navigation are examined, taking into account the nonuniform GPS constellation, differential GPS navigation, navigation processing design for a low-cost GPS navigation system, an ionospheric refraction correction model for single-frequency Doppler navigation, a GPS receiver design for general aviation navigation, and geodetic positioning using a global positioning system of satellites. Questions of undersea navigation are investigated, giving attention to gravity gradiometry in a shipboard environment, stochastic and deterministic modeling of gravity gradiometer data, state-space models of gravity disturbance gradients, the astro-geodetic measurement of vertical deflection, the real-time estimation of vertical deflections using a gravimeter, and the laser gyro potential for long endurance marine navigation. Other topics discussed are related to time and frequency as applied to navigation systems, terrestrial-based radio navigation, self-contained navigation, integrated communications and navigation systems, the emerging civil navigation requirements and applications, the navigation of space vehicles, and mapping, charting, and geodesy for navigation systems. G.R.

A82-18132 **A GPS receiver design for general aviation navigation.** B. D. Elrod (Stanford Telecommunications, Inc., McLean, VA), H. A. Bustamante, and F. D. Natali (Stanford Telecommunications, Inc., Sunnyvale, CA). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 33-41. 6 refs. U.S. Department of Transportation Contracts No. FA77WAI-757; No. FA78WA-4216.

The NAVSTAR Global Positioning System (GPS) will provide RF transmissions from a constellation of satellites for accurate position, velocity and/or time determination by suitably equipped users. An investigation by the FAA is conducted regarding the potential use of the GPS system for civil navigation to supplement or replace VOR/DME in the National Aerospace System. Of the nearly 200,000 civil aviation aircraft in use today, about 30% are equipped with 'low budget' navigation avionics. One of the objectives of the investigation is related to the development of low cost receiver designs for the navigation requirements of civil aviation. A description is presented of a GPS receiver design satisfying the needs of general aviation navigation. G.R.

A82-18139 **Maneuver dependent component error models and synchronized reset filters for inertial navigation systems.** W. H. Fincke and A. J. Kleinman (Dynamics Research Corp., Wilmington, MA). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 107-114.

In many inertial navigation systems (INS), external information in the form of position and/or velocity updates is used in conjunction with an estimation filter to make corrections to the INS to improve accuracy. Attention is given to a design of statistical estimation filters which has been found effective in improving accuracy when there are error sources that are sensitive to vehicle maneuvers. The errors may include reference velocity errors which are speed sensitive, or other errors that may be implemented as part of the navigation reset filter, or as a spacial prenavigate calibration sequence of vehicle maneuvers or platform rotations. G.R.

A82-18141 # **Selecting the post 1990 civil aviation radionavigation system.** J. C. Heurtley and J. W. Bradley (FAA, Office of Systems Engineering Management, Washington, DC). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 177-181.

Investigations are being conducted which are to provide a basis for the selection of the radionavigation system or combination of systems which can best satisfy the requirements of the post 1990 time period. In 1983 the Department of Defense and the Department of Transportation are to make a joint recommendation on the navigation system mix for the post 1995 timeframe. The final area of consideration in selecting the post 1990 Civil Aviation Radionavigation System is the institutional issue. This issue encompasses international acceptance and standards, cost recovery policies, and in the case of NAVSTAR GPS the denial of accuracy, number of satellites, spare satellite policy, and military control of a system used for civil navigation. These issues are still to be resolved. G.R.

A82-18143 **A new end-fire ILS glide slope.** C. B. Watts, Jr. In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 190-197. 8 refs.

The end-fire glide slope described here is a modification of standard ILS ground equipment designed to serve runways where it is not practical to install one of the present conventional systems. The antenna does not use a tower; an array of slotted cable elements is mounted on the runway shoulder, sufficiently low to clear wings and engine nacelles, and is frangible to avoid serious damage to an airplane which might run off the pavement. It is noted that savings in earth movement can amount to many times the cost of the antenna. End-fire development is traced from 1942. C.R.

A82-18144 **Solid-state VORTAC with remote maintenance and monitoring.** A. Lang (ITT Avionics Div., Nutley, NJ) and W. Hundley (Wilcox Electric, Inc., Kansas City, MO). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 198-207.

Because of the widespread use and high capital investments in the VORTAC and VOR/DME system, there are indications that the U.S. and the ICAO will extend these services beyond 1995, the year that protection was to have expired. Owing to problems related to maintenance and the replacement of parts, the FAA let a contract to industry to replace all the old tube-equipped VORs, VOR-DMEs, and VORTACs with a total system architecture that embodies modern technology. The system being produced for the FAA is described. Maintenance costs have been reduced as a result of four improvements: (1) improved reliability of an all solid-state design; (2) improved maintainability through modular construction with automatic fault isolation; (3) reduced maintenance by use of a solid-state and digital circuits; and (4) reduced routine trips by maintenance technicians to each facility, from one or two per week to once per 3 months, as a result of remote certification and maintenance testing. C.R.

A82-18145 **MLS - A new generation landing guidance system is here.** R. M. Cox and J. M. Shirey (Bendix Corp., Communications Div., Baltimore, MD). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 208-215.

The Microwave Landing System (MLS), an air-derived system operating in the C-band, comprises azimuth guidance, elevation guidance, and ranging elements which provide continuous, accurate, three-dimensional position information within a wide coverage volume of the desired landing site. In the Time Reference Scanning Beam (TRSB) MLS, ground-based equipments provide signals to the airborne user from which position information is derived. An important difference between ILS and MLS is angular coverage; ILS is a VHF/UHF system which provides straight-in guidance only on a single fixed glide path. The MLS is a high-frequency microwave system operating at C-band (5031-5090 MHz), providing volumetric coverage over a sector of as much as + or - 60 deg in azimuth and 0-30 deg in elevation. It is noted that a precision DME (L-band, 978-1213 MHz) is available with the MLS to provide accurate range information and thus allow the aircraft to determine its exact position in the prescribed coverage volume. C.R.

A82-18146 **The DME-based Azimuth System /DAS/.** H. Vogel and W. Seith (Standard Elektrik Lorenz AG, Stuttgart, West Germany). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 216-223. 5 refs.

In a competition organized by the ICAO to select a new precision approach and landing system, the DME-based Landing System (DLS) was submitted by the Federal Republic of Germany. Parts of this design were recommended for further development. These elements, which represent the DME-based Azimuth System (DAS), are the L-band precision DME and the 360-deg azimuth service utilizing DLS principles. The DME-based Azimuth System can be regarded as an improved Distance Measuring System (DME) with additional capabilities. The DAS has three essential characteristics: (1) in comparison with the conventional DME, where the measurement errors may amount to several hundred meters, the DAS distance measurement accuracy is considerably improved; (2) the DAS ground station determines with a high degree of accuracy the bearing to the interrogation aircraft and transmits this azimuth information to the airborne station; and (3) the DAS contains a ground-to-air data link. The frequency range is 962-1213 MHz; there are 20 DME frequencies with existing modes and 40 DME frequencies with additional co-channel modes. C.R.

A82-18147 **Flight measurements of Area Navigation System performance using various combinations of ground aids and airborne sensors.** R. A. Harlow (Royal Aircraft Establishment, Bedford, England). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 228-235.

A description is given of flight trials undertaken to determine the accuracy of an Area Navigation (RNAV) System which uses currently available radio aids, and practical aspects of RNAV operation are discussed. Results show that, in an en-route environment, the position-fixing errors made by using Distance Measuring Equipment (DME)/DME navigation were less than half as many as those made in the course of VHF Omnidirectional Range (VOR)/DME navigation. In addition, DME/DME navigation proved to be more accurate than VOR/DME in a Terminal Maneuvering Area (TMA) environment, although the difference was less pronounced in the en-route situation because of the limited ground aids available in the trials area. The trials area was not representative of major European TMAs. The use of inertial velocity information rather than air data signals for the smoothing of RNAV aircraft position estimates was found to give significant accuracy improvements in VOR/DME guidance. O.C.

A82-18150 **Laboratory and flight test of a new RLG strapdown INS.** R. E. Ebner (Litton Systems, Inc., Woodland Hills, CA). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 257-263.

A strapdown inertial navigation system using ring laser gyros is tested. Laboratory data are presented showing gyrocompass heading accuracy under differing gyro random walk disturbances, navigation during three-axis Scorsby motion, and navigation following a 180 deg turn. A dominant error source during the Scorsby motion is described, and test data for preliminary gyros which achieve a CEP of 1.4 nmi/h are presented. A new generation system with missile grade RLGs and a third series with higher performance instruments are tested, and the third series demonstrates a performance under 1 nmi/h with a 4 minute reaction time. D.L.G.

A82-18151 **Position extrapolation quality calculation for inertial and Doppler-AHRS navigation systems.** J. Yoh and R. Dunn (Intermetrics, Inc., Warminster, PA). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 280-284.

The Position Extrapolation Quality (PEQ) is defined as the second mean of the second backward difference of the earth-referenced level position error read from the dead reckoner, sampled every thirty seconds. It is noted that because of truncation error in the outputs, this second difference is not available for all dead reckoners to the precision required. In this case, one takes the second mean of the second difference of the integral of the error in reported velocity. When the reporting interval is short, this quantity is equivalent to the other and is affected to a much lesser extent by truncation. Since certain of the underlying processes encountered in most dead reckoner types are not ergodic, it is not possible to evaluate this covariance matrix with a time average. It is necessary to either average over a number of runs with different equipment of the same type or to compute the PEQ using an established model for the type. It is shown here how it is possible to develop reasonable estimates for the PEQ of three types of dead reckoners from statistical models. C.R.

A82-18152 **JTIDS distributed TDMA /DTDMA/ terminal development results with emphasis on relative navigation performance.** J. Rubin and S. Weit (ITT, ITT Avionics Div., Nutley, NJ). In: PLANS '80 - Position Location and Navigation Symposium, Atlantic City, NJ, December 8-11, 1980, Record. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 285-290. Contract No. N62269-76-C-0106.

Laboratory testing has been completed for Advanced Development Model (ADM) terminals developed for the DOD Joint Tactical Information Distribution System (JTIDS) program. The terminals feature the JTIDS Phase II Distributed Time Division Multiple Access (TDMA) architecture, and include two Class 1 Command and Control terminals, two Class 2 Tactical Fighter terminals, and one JTIDS Environment Simulator. The JTIDS II/D-TDMA operates in Lx-band, from 960 to 1215 MHz, and provides a system that combines spread-spectrum multiple-access command and control functions with conventional TACAN navigation and IFF identification service. Attention is given the Relative Navigation (REL NAV) function of the system, which ties the operations of a tactical community of users to a common relative navigation grid, while optimally blending the fast-response and short-term accuracy of self-contained, dead reckoning navigation with JTIDS-derived position and status reports from multiple users. O.C.

A82-18153 **JTIDS RELNAV network off-line simulation.** J. B. Chadwick (Hughes Aircraft Co., Ground Systems Group, Fullerton, CA). In: PLANS '80 - Position Location and Navigation

A study was initiated to accurately determine the weight percent of pyridine present in pyridine-modified JP-4 used for contractual combustion studies. High Performance Liquid Chromatography (HPLC) was the method of choice. A chromatographic process was developed and systematic quantitative analses performed to substantiate the accuracy and precision of the new test method. A computing integrator interfaced with the HPLC system performed all data collection and calculations automatically, with the results printed on a teletype. Least square curve fitting accentuated the reliability for determining pyridine in the 0.5 to 5.0 weight percent concentration range. Author (GRA)

COMBUSTION BEHAVIOR OF SOLID FUEL RAMJETS. VOLUME 1: CORRELATION OF REACTING AND NON-REACTING FLOW CHARACTERISTICS Final Report
Brian A. Binn, Winston E. Scott, and David W. Wetzer Jul. 1981 68 p refs
(AD-A106061; NPS67-81-010-Vol-1) Avail: NTIS HC A04/MF A01 CSCL 21/2

An experimental investigation was conducted to determine the relationship between the cold flow characteristics of velocity, pressure distribution, and turbulence intensity and the reacting flow performance and combustion characteristics of a solid fuel ramjet. The effects of configuration and air flow changes on the above characteristics were examined. Average regression rates and combustion efficiencies were not significantly affected by changes in configuration. These variations in test conditions significantly affected the centerline turbulence intensity but not the near-wall turbulence intensity in cold flow. Near-wall turbulence profiles in cold flow were found to correlate with the fuel regression profiles in reacting flows. The use of bypass resulted in decreases in regression rate and efficiencies for all cases. Author (GRA)

DEVELOPMENT OF IMPROVED HIGH TEMPERATURE COATINGS FOR IN-792 + Hf Final Report
D. D. Profant and S. K. Naik Jun. 1981 95 p refs
(Contract NAS3-22371; DA Proj. 1L1-62209-AH-76)
(NASA-CR-165395) Avail: NTIS HC A05/MF A01 CSCL 11F

The development for t-55 l712 engine of high temperature for integral turbine nozzles with improved thermal fatigue resistance without sacrificing oxidation/corrosion protection is discussed. The program evaluated to coating systems which comprised one baseline plasma spray coating (12% Al-NiCoCrALY), three aluminide coatings including the baseline aluminide (701), two CoNiCrAly (6% Al) + aluminide systems and four NiCoCrY + aluminide coating were evaluated. The two-step coating processes were investigated since it offered the advantage of tailoring the composition as well as properly coating surfaces of an integral or segmented nozzle. Cyclic burner rig thermal fatigue and oxidation/corrosion tests were used to evaluate the candidate coating systems. The plasma sprayed 12% Al-NiCoCrAlY was rated the best coating in thermal fatigue resistance and outperformed all coatings by a factor between 1.4 to 2.5 in cycles to crack initiation. However, this coatings is not applicable to integral or segmented nozzles due to the line of sight limitation of the plasma spray process. The 6% Al-CoNiCrAlY + Mod. 701 aluminide (32 w/o Al) was rated the best coating in oxidation/corrosion resistance and was rated the second best in thermal fatigue resistance. J.D.H.

EXTERNAL FUEL VAPORIZATION STUDY Final Report
E. J. Szetela and J. A. TeVelde Nov. 1981 92 p refs
(NASA-CR-165513; UTRC-81-915326-15) HC A05/MF A01 CSCL 21D

The feasibility of external fuel vaporization in advanced aircraft gas turbine engines is addressed. Experiments were run to determine key fuel properties including boiling points, dew points, critical temperature, critical pressure, heat transfer coefficients, deposit formation rates, and deposit removal in a flowing system. Of particular concern were the heat transfer rate in the heat exchanger and the performance of the orifice used in the throttling process. Three fuels were utilized in the experiments including Jet-A, Experimental referee broad specification fuel, and a premium No. 2 diesel fuel. Engine conditions representing the NASA Energy Efficient Engine at sea level takeoff, cruise, and idle were simulated in the vaporization system and it was found that single phase flow was maintained in the heat exchanger and downstream of the throttle. Deposits encountered in the heat exchanger represented a thermal resistance as high as .0013 sq M K/watt and a deposit formation rate as high as 600 micro-gC/sq cm hr. These values are equivalent to a buildup of 0.055 cm of thickness in 36 hours resulting in a more severe fouling condition than originally anticipated. It was found that the deposit can be removed by cleaning with air at a temperature of 720 K for 10 minutes. R.J.F.

RESEARCH ON AN INDUCTION DRIVEN CRYOGENIC WIND TUNNEL
Alain Blanchard, Jean-Bernard Dor, Andre Mignosi, and Jean-Francois Breil *In its* La Rech. Aerospatiale, Bi-monthly Bull. No. 1981-2, Mar. - Apr. 1981 (ESA-TT-713) Sep. 1981 p 63-77 refs Transl. into ENGLISH from La Rech. Aerospatiale, Bull. Bimensuel (Paris) No. 1981-2, Mar. - Apr. 1981

Avail: NTIS HC A05/MF A01; original FRENCH report available at ONERA, Paris FF 45

The cryogenitization of an induction driven transonic wind tunnel is discussed. Internal insulation and the design of a liquid nitrogen injection system are considered. A unit of 32 injectors is arranged at the periphery of the first diffuser in two rows. Each injector is controlled by a solenoid valve. Several elements can be brought together at the control point to form a 10 bit digital regulation unit. The nitrogen pulses are kept symmetrical by varying the response time of the solenoid valves. This induction system works well, since the increase in nozzle performance compensates increase of flow in the test, section due to the drop in temperature. It should be suitable with nitrogen gas. Composite and homogeneous insulating materials were repeatedly plunged into liquid nitrogen. All reveal defects when exposed to stress induced by differences in the expansion between their internal and external faces. Internal surfaces must be reinforced with polyurethane. Author (ESA)

Computer aided design and analysis techniques were applied to power processing equipment. Topics covered include: (1) discrete time domain analysis of switching regulators for performance analysis; (2) design optimization of power converters using augmented Lagrangian penalty function technique; (3) investigation of current-injected multiloop controlled switching regulators; and (4) application of optimization for Navy VSTOL energy power system. The generation of the mathematical models and the development and application of computer aided design techniques to solve the different mathematical models are discussed. Recommendations are made for future work that would enhance the application of the computer aided design techniques for power processing systems. A.R.H.

DEVELOPMENT OF AN EFFICIENT PROCEDURE FOR CALCULATING THE AERODYNAMIC EFFECTS OF PLANFORM VARIATION Final Report
J. E. Mercer and E. W. Geller Washington NASA Dec. 1981 36 p refs
(Contract NAS1-15877)
(NASA-CR-3489; FLOW-RR-186) Avail: NTIS HC A03/MF A01 CSCL 20K

Numerical procedures to compute gradients in aerodynamic loading due to planform shape changes using panel method codes were studied. Two procedures were investigated: one computed the aerodynamic perturbation directly; the other computed the aerodynamic loading on the perturbed planform and on the base planform and then differenced these values to obtain the perturbation in loading. It is indicated that computing the perturbed values directly can not be done satisfactorily without proper aerodynamic representation of the pressure singularity at the leading edge of a thin wing. For the alternative procedure, a technique was developed which saves most of the time-consuming computations from a panel method calculation for the base planform. Using this procedure the perturbed loading can be calculated in about one-tenth the time of that for the base solution. Author

(NASA-TM-76580) Avail: NTIS HC A03/MF A01 CSCL 13B

The annoyance factor caused by air traffic noise on the residents of areas near airports is discussed. The psophic index is used to predict the level of overall annoyance suffered on the average by residents around airports. The calculation method differentiates between daytime and nighttime annoyance. E.A.K.

THE MODULAR AUTOMATED WEATHER SYSTEM (MAWS) CONCEPT
Donald A. Chisholm, Richard H. Lynch, and James C. Weyman *In* ESA Nowcasting: Mesoscale Observations and Short-Range Prediction Jun. 1981 p 303-307 refs

Avail: NTIS HC A19/MF A01; ESA, Paris FF 180 Member States, AU, CN and NO (+20% others)

A modular automated weather system (MAWS) which is a supervisory microprocessor that manages, disseminates and archives visibility, wind, temperature, and dew point measurements as well as outputs from ceilometers, transmissometers, digital altimeters, and digital clocks is discussed. Results are assessed for: (1) aviation weather elements and sensors suitable for automation; (2) sensor siting requirements for aviation critical weather elements; (3) performance potential of microprocessor components, display devices and communication systems; (4) the importance of met watch parameters in support of aviation operations; and (5) utility of short range forecast guidance based on simple statistical models. A microprocessor based MAWS system satisfies most automated observation requirements and provides an essential data base for the development of operational prototypes. Author (ESA)

SELF OSCILLATION
Self-oscillations of the front caster wheel strut for a given track width under the assumption of the wheel drift hypothesis
A82-16290
SEMICONDUCTOR DEVICES
High temperature electronic requirements in aeropropulsion systems
[E-708] N82-15313
SEPARATED FLOW
Computations of transonic flow over an oscillating airfoil with shock-induced separation
[AIAA PAPER 82-0350] A82-17900
Low Reynolds number airfoil survey, volume 1
[NASA-CR-165803-VOL-1] N82-14059
Aerodynamic response of a blade in pitching oscillation with partial and full separation --- measurement of the instantaneous pressure distribution around a vibrating blade surface in a wind tunnel
N82-15047
SERVICE LIFE
A method for predicting the lifetime of gas turbine blades
A82-16692
Effects of ultra-clean and centrifugal filtration on rolling-element bearing life
[ASME PAPER 81-LUB-35] A82-18436
SHEAR FLOW
Responses of oscillating wings in weak shear flow
A82-18021
Three-dimensional analysis of cascade flutter in parallel shear flow
N82-15062
SHELL STABILITY
Calculation of the stability of crosswise-reinforced cylindrical shells
A82-18621
SHOCK WAVE INTERACTION
Computations of transonic flow over an oscillating airfoil with shock-induced separation
[AIAA PAPER 82-0350] A82-17900
Calculation of the unsteady loads on the surface of a moving wedge with an incident shock wave
A82-18590
SHOCK WAVES
Experimental investigation of a transonic potential flow around a symmetric airfoil
[NASA-TM-76676] N82-14057
SHORT TAKEOFF AIRCRAFT
An investigation of the use of a propulsive wing/canard concept for improved maneuvering
[AIAA PAPER 81-2622] A82-16905
MLS vertical guidance and navigation for a STOL airplane landing on an elevated STOLport
[NASA-TM-81338] N82-14101
SIGNATURE ANALYSIS
ADEN plume flow properties for infrared analysis --- Augmented Deflecting Exhaust Nozzle
A82-17606
SIMULATORS
Performance calibration results for a Compact Multimission Aircraft Propulsion Simulator
[AIAA PAPER 82-0254] A82-17866
SKIN (STRUCTURAL MEMBER)
Tensile fatigue assessment of candidate resins for use in fibre reinforced composite repair schemes
A82-17531
SLENDER BODIES
Wind tunnel investigations for the flat spin of slender bodies at high angles of attack
[AIAA PAPER 82-0054] A82-17755
Viscous flow - Nemesis of the theoretician in pursuit of higher order accuracy
[AIAA PAPER 82-0389] A82-17919
SLENDER WINGS
A theoretical investigation of wing rocking
[NASA-CR-165058] N82-15031
SLOTTED WIND TUNNELS
Three-dimensional flow studies on a slotted transonic wind tunnel wall
[AIAA PAPER 82-0230] A82-17855
SOIL MECHANICS
C-5A operational utility evaluation soil tests and analysis
[AD-A105555] N82-14083
SOLID PROPELLANT COMBUSTION
Combustion behavior of solid fuel ramjets. Volume 1: Correlation of reacting and non-reacting flow characteristics
[AD-A106061] N82-14316
SOLID STATE DEVICES
Solid-state VORTAC with remote maintenance and monitoring
A82-18144
SOLVENTS
Determination of selected distillate blending solvents in simple and complex aircraft fuel matrices via glass capillary gas chromatography
[AD-A105588] N82-14312
SONIC NOZZLES
Screech suppression in supersonic jets
[AIAA PAPER 82-0050] A82-17753
SOUND FIELDS
An iterative finite element-integral technique for predicting sound radiation from turbofan inlets in steady flight
[AIAA PAPER 82-0124] A82-17796

SOUND PRESSURE
Propeller tip vortex - A possible contributor to aircraft cabin noise
A82-17603

SOUND PROPAGATION
Scattering of sound by a vortex ring
A82-16148

SOUND TRANSMISSION
Noise control measures in the new Singapore International Airport
A82-16746

Development of a transmission loss test facility for light aircraft structures
A82-18728

SOUND WAVES
Scattering of sound by a vortex ring
A82-16148

SPACE MISSIONS
Aeronautics and space report of the President, 1980 activities
[NASA-TM-84079] N82-16022

SPACE SHUTTLE ORBITERS
The residue-measure criterion for model reduction in the analysis of the NASA Space Shuttle's digital flight control system
[AIAA PAPER 82-0369] A82-17909

SPACECRAFT CHARGING
A study of the effect of the flight vehicle body potential on the characteristics of ion attitude transmitters
A82-18596

SPACECRAFT CONTROL
NAVSTAR Global Positioning System
A82-17310

SPACECRAFT DESIGN
Aerospace highlights 1981
A82-16135

SPEED INDICATORS
A true air speed sensor for miniature unmanned aircraft
[RAE-TM-SPACE-287] N82-14086

SPILLING
Pollution of the soil by aviation gasoline
[PML-1979-41] N82-15596

SPIN DYNAMICS
Wind tunnel investigations for the flat spin of slender bodies at high angles of attack
[AIAA PAPER 82-0054] A82-17755

SPIN TESTS
Wind tunnel investigations for the flat spin of slender bodies at high angles of attack
[AIAA PAPER 82-0054] A82-17755

SPLINE FUNCTIONS
Development of an efficient procedure for calculating the aerodynamic effects of planform variation
[NASA-CR-3489] N82-14529

SPOILERS
Unsteady flow patterns associated with spoiler control devices
[AIAA PAPER 82-0127] A82-17798

SPOOLS
Cavitation inception in spool valves
A82-16428

STABILITY AUGMENTATION
Accelerated development and flight evaluation of active controls concepts for subsonic transport aircraft. Volume 2: AFT C.G. simulation and analysis
[NASA-CR-159098] N82-15077

STABILITY DERIVATIVES
Stability and flutter analysis of turbine blades at low speed
N82-15050

Development and trial of a rotary balance for the 3 m-low speed wind tunnels in the Federal Republic of Germany
[BMFT-FB-W-81-022] N82-15083

STABILITY TESTS
The residue-measure criterion for model reduction in the analysis of the NASA Space Shuttle's digital flight control system
[AIAA PAPER 82-0369] A82-17909

STATIC PRESSURE
Subsonic balance and pressure investigation of a 60-deg delta wing with leading-edge devices (data report)
[NASA-CR-165806] N82-15014

STATIC TESTS
Prediction of flyover jet noise spectra from static tests
[NASA-TM-83219] N82-14880

STATIC THRUST
Take-off ground roll of propeller driven aircraft
A82-17607

STEELS
Advantages and limitations in the use of diverse materials for aircraft construction --- composite versus metallic materials
[SNIAS-811-551-104] N82-15011

STRAIN GAGE BALANCES
An afterbody drag balance --- transonic wind tunnel gages
[RAE-TM-AERO-1897] N82-14103

STRAPDOWN INERTIAL GUIDANCE
Laboratory and flight test of a new RLG strapdown INS
A82-18150

Description of a dual fail operational redundant strapdown inertial measurement unit for integrated avionics systems research
N82-14842

STREAM FUNCTIONS (FLUIDS)
Direct approach to aerodynamic design problems
A82-16404

STRESS CONCENTRATION
Improvement of the first-ply-failure strength in laminates by using softening strips
A82-16174

Investigation of the stress-strain state of a rectangular wing section of variable thickness under concentrated loads and heating
A82-18588

STRESS INTENSITY FACTORS
Stress intensity factor measurements in composite sandwich structures
A82-17535

STRESS MEASUREMENT
Stress intensity factor measurements in composite sandwich structures
A82-17535

STRESS-STRAIN RELATIONSHIPS
Investigation of the stress-strain state of a rectangular wing section of variable thickness under concentrated loads and heating
A82-18588

STRUCTURAL ANALYSIS
La Recherche Aerospatiale, Bi-monthly Bulletin No. 1981-2, March - April 1981 --- aerodynamic research
[ESA-TT-713] N82-14388

STRUCTURAL DESIGN
Design procedures for compressor blades
A82-17135

Modern aircraft accident investigation equipment and techniques
A82-17419

Optimal subsonic diffuser wall design for arbitrary entry conditions
[AIAA PAPER 82-0132] A82-17800

Flutter mode suppression using hyperstable feedback
[AIAA PAPER 82-0368] A82-17908

The residue-measure criterion for model reduction in the analysis of the NASA Space Shuttle's digital flight control system
[AIAA PAPER 82-0369] A82-17909

Highlights of a design concept for a close ground support fighter
[AIAA PAPER 82-0411] A82-17932

Design and testing of a new double labyrinth seal
[ASME PAPER 81-LUB-58] A82-18452

The design of a jet catcher --- for wind tunnels
[RAE-TM-AERO-1891] N82-14102

STRUCTURAL DESIGN CRITERIA
Multilevel optimum design of structures with fiber-composite stiffened-panel components
[AIAA PAPER 80-0723] A82-17594

STRUCTURAL INFLUENCE COEFFICIENTS
Experimental structural testing on a composite aircraft canard and its applications
[AIAA PAPER 82-0409] A82-17930

STRUCTURAL RELIABILITY
Special problems associated with aircraft radomes
A82-16558

Modern aircraft accident investigation equipment and techniques
A82-17419

HENDERSON, C.
Development and validation of the V/STOL aerodynamics and stability and control manual
[AIAA PAPER 81-2611] A82-16903

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service, American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

simulation of certain subsystems. The hot bench is a well known development, test, and integration tool for real-time avionics systems. The simulation software portion of the Hot Bench is discussed. G.R.

A82-19245 **Radar environment simulation for software test.** W. D. Horner (Westinghouse Defense and Electronic Systems Center, Baltimore, MD). In: Summer Computer Simulation Conference, Washington, DC, July 15-17, 1981, Proceedings. Arlington, VA, AFIPS Press, 1981, p. 341-343.

Real-time radar environment simulations are used to speed up the software integration and debug phase of radar system development. The entire radar environment can be simulated for the operational flight program (OFP) resident within the fire control radar computer (RC) by physically connecting the RC to a simulation support computer through special purpose hardware interfaces. A description is provided of some of the capabilities of a radar environment simulation used in conjunction with actual embedded radar computer hardware. The real power of the simulation lies in its organization which makes it possible to make use of the hardware freeze capability, within the embedded computer. G.R.

A82-19253 **A fuel control system designers approach to gas turbine engine computer model validation.** R. M. Evans (Aviation Electric, Ltd., Montreal, Canada). In: Summer Computer Simulation Conference, Washington, DC, July 15-17, 1981, Proceedings. Arlington, VA, AFIPS Press, 1981, p. 532-537. Department of Industry, Trade and Commerce Contract No. 9ST79-00058.

A hybrid computer model of a gas turbine driving a helicopter rotor system is assembled and shown to be an accurate simulation in both steady state and transient modes of operation when compared to actual engine data. A fuel controller is designed, which employs innovative control mode concepts using the engine model to define the control mode concepts using the engine model to define the control mode parameters. The basic structure of the model is shown to be sound and applicable to other types of gas turbines. D.L.G.

A82-19256 **SIMATR - An air battle simulation of the USAF Tactical Air Control System /TACS/ with Advanced Tactical Radars.** J. Golub, D. M. Greeley, and B. B. Levy (RCA, Missile and Surface Radar Div., Moorestown, NJ). In: Summer Computer Simulation Conference, Washington, DC, July 15-17, 1981, Proceedings. Arlington, VA, AFIPS Press, 1981, p. 636-641.

The objective of SIMATR (Simulation of Integrated Multiple Advanced Tactical Radars) is to demonstrate the value of a network of Advanced Tactical Radars (ATRs) in an air battle through the increased effectiveness of the interceptors in repulsing the attack. This increased effectiveness is attained by directly controlling and designating the airborne interceptor radar to provide the interceptor a relatively free and unanswered first shot of an air-to-air weapon. The basic SIMATR operation is described, and an example is provided of defensive force reaction to a massive enemy air attack. System enhancements that may further expand its capabilities and increase its effectiveness are discussed. C.R.

A82-19259 **Simulation of advanced cockpits.** J. M. Reising (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) and L. Hitchcock (FAA, Technical Center, Atlantic City, NJ). In: Summer Computer Simulation Conference, Washington, DC, July 15-17, 1981, Proceedings. Arlington, VA, AFIPS Press, 1981, p. 662-665. 5 refs.

The development of advanced digital graphics and displays which utilize the capabilities of full-color, computer generated pictures is described. The transition is being made from electromechanical displays and associated numerical formats to electro-optical displays which employ advanced symbols and special algorithms for real-time projection. Pictorial formats provide intuitive, simple representations of how the aircraft is performing, its situation relative to other traffic, the presence of ground obstacles, and emergencies and remedial procedures. New formats are recommended to be screened in a two stage evaluation involving mock-ups and simulators, and are subjected to pilot scrutiny to determine acceptability. The digital Synthesis Facility is described, including the use of an A-7 cockpit and a PDP-11/50 computer system for real-time simulation of A-7 flight. M.S.K.

A82-19260 * **Real-Time Simulation Computation System.** J. L. Fetter (NASA, Ames Research Center, Moffett Field, CA). In: Summer Computer Simulation Conference, Washington, DC, July 15-17, 1981, Proceedings. Arlington, VA, AFIPS Press, 1981, p. 666-670. 9 refs.

The Real-Time Simulation Computation System, which will provide the flexibility necessary for operation in the research environment at the Ames Research Center is discussed. Designing the system with common subcomponents and using modular construction techniques enhances expandability and maintainability qualities. The 10-MHz series transmission scheme is the basis of the Input/Output Unit System and is the driving force providing the system flexibility. Error checking and detection performed on the transmitted data provide reliability measurements and assurances that accurate data are received at the simulators. D.L.G.

A82-19263 # **Experience with flight simulators - Training effectiveness-future developments.** J. F. Smith (USAF, Human Resources Laboratory, Williams AFB, AZ). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-110.* 12 p.

The progress, development, and effectiveness of flight simulators are examined from the introduction of the Link trainer to predictions of future directions and capabilities. The first six simulators were delivered in 1934 and by WW II congressional reports asserted that armed service savings in manhours and expenses were in millions of hours and hundreds of millions of dollars. Electronic simulation began after WW II, and with the arrival of jet aircraft, simulators were used for instrument and procedures training, as well as weaponry and refueling operations. Visual representations were added in the 1970's, along with low-level flight cuing, manual reversion problems, and remote operation of a simulator from different bases. Recommendations are provided for optimized use of present simulators, and the employment of simulators as testing grounds for pilots, for total environment simulation, and the development of part-task trainer systems in the future are discussed. M.S.K.

A82-19264 # **Cost efficiency versus objective fidelity in flight simulation (Kosteneffektivität gegenüber objektivem Realismus bei der Flugsimulation).** G. Dörfel and H. Distelmaier (Forschungsinstitut für Anthropotechnik, Wachtberg-Werthoven, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-104.* 15 p. 8 refs. In German.

The effect of the objective fidelity level on the simulation cost is considered, taking into account relative cost as a function of motion fidelity and visual scene fidelity levels. Cost considerations make it necessary to conduct an investigation regarding the degree to which an achievement of objective fidelity is desirable for flight simulation processes. It has to be taken into account that the simulator is not an aircraft copy, but any educational device employed to obtain a certain objective regarding the training of a pilot. A study is required regarding the approaches needed to achieve this objective, taking into account the extent of the information which has to be presented and the effect of the various cues on the pilot and his performance. Previous investigations show that subjective fidelity can help to achieve, at a lower cost, training results of the same quality as objective fidelity. These conclusions apply to full-mission simulators and to part-time training devices. G.R.

A82-19265 # **Properties of the new flight and tactics simulators (Eigenschaften der neuen Flug- und Taktiksimulatoren).** H.-J. Balke (Bundesamt für Wehrtechnik und Beschaffung, Koblenz, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-106.* 17 p. In German.

In the 1970s, the Armed Forces of the Federal Republic of Germany have placed orders for many simulators, which are currently being used or which will be received in the next few years. All new simulators employ exclusively digital computers. The combined use of display and computer makes the simulator an efficient training device. A pilot can draw conclusions regarding the flight conditions of the aircraft on the basis of the aircraft motions perceived by him. Facilities are provided which make it possible for the pilot to practice such a utilization of aircraft motions in the simulator. The employed kinematic system performs motion processes involving 6 degrees of freedom. The G-seat in connection with the G-suit can convey to the pilot the impression that he is flying at accelerations greater than 1 g. Attention is also given to equipment used to make the aid of the instructor more effective, aspects of radar simulation, and the simulation of electronic warfare situations. G.R.

A82-19266 # **Procurement of the new flight and tactics simulators - Experience, problems, meaning (Beschaffung der neuen Flug- und Taktiksimulatoren - Erfahrungen, Probleme, Sinn).** H.-J. Balke (Bundesamt für Wehrtechnik und Beschaffung, Koblenz, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-095.* 8 p. In German.

The stationary flight and tactics simulator is used for the training of flight crews. An aircraft cockpit is employed, while electronic computers simulate the behavior of the aircraft, the characteristics of the aircraft equipment, and the operation of the engine. A number of similar appearing names are employed for simulators and other training devices. It is, therefore, sometimes difficult to distinguish between training devices for ground personnel and the simulators for flight crews. A description of the meaning of the various terms employed in this connection is provided as an aid for the appropriate identification of a device. Attention is given to market considerations regarding the purchase of simulators, details concerning the simulator procurement process, and the benefits obtained by an employment of flight and tactics simulators. G.R.

A82-19267 # **Requirements regarding digital external view systems for full mission flight and tactics simulators (Anforderungen an Digitale Aussensichtsysteme für Full Mission Flug- und Taktiksimulatoren).** P. Güldenpfennig (Messerschmitt-Bölkow-Blohm GmbH, Ottobrunn, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-100.* 14 p. In German.

During the time period from 1975 to 1977 a computer-generated image (CGI) system for the training simulator Tornado was developed by an aerospace company in West Germany. A school for the study of weapon systems, four squadrons of the German Air Force, and two squadrons of the German Navy were equipped with flight and tactics simulators for the training of Tornado crews. The principal combat objectives for the Tornado aircraft are related to the performance of battlefield interdiction and strike missions. A CGI system prototype is considered along with an evaluation of the CGI system prototype by pilots of the German Air Force and Navy. The results of the evaluation are discussed, taking into account each of the various types of operation to be performed with the aircraft. The evaluation led to the formulation of requirements for new technical system parameters. The specified requirements are related to an enhancement of the data base storage capacity, image improvement, improved resolution, and the employment of texturing and curved shading. G.R.

A82-19268 # **The procurement of flight simulators at the German Lufthansa (Die Beschaffung von Flugsimulatoren bei der Deutschen Lufthansa).** W.-D. Hass (Deutsche Lufthansa AG, Frankfurt am Main, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-093.* 10 p. In German.

Flight simulators have become indispensable for the training of airline pilots. Questions regarding the requirements for flight simulators arise, therefore, in connection with the introduction of new aircraft types or the enlargement of the fleet of existing aircraft types. Decisions have to be made concerning the placing of an order for a simulator or the purchase of simulator time on devices of the aircraft manufacturer or other companies. It is advisable to specify in the contract covering the purchase of the aircraft that the aircraft manufacturer has to provide data and components to a flight simulator producer. With respect to the Lufthansa, during the last 15 years there was almost always a relationship between the orders for an aircraft and a simulator. Price and delivery information from simulator manufacturers is obtained as soon as the negotiations regarding the purchase of aircraft appear to lead to a concrete agreement. Attention is given to procurement specifications, evaluation criteria, and a point system for an evaluation. G.R.

A82-19269 # **Flight simulation consoles, aid or obstruction - Objective evaluation of control consoles of modern flight and tactics simulators (Flugsimulatorbedienkonsolen, Hilfe oder Behinderung - Objektive Bewertung von Bedienkonsolen moderner Flug- und Taktiksimulatoren).** B. Heger, A. L. Lippay, M. McKinnon, A. Del Mar, and R. Glass (CAE Electronics GmbH, Stolberg, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-097.* 24 p. In German.

An investigation was conducted with the objective to develop a model for the evaluation of control consoles at training simulators, taking into account the function of the console as human-machine interface. The obtained information is to be used in connection with the development of new control consoles. The investigation made use of System Analysis by Integrated Network of Tasks (SAINT) to analyze the operational stress to which an instructor is subjected during the training. The tasks of the instructor were divided with respect to typical activity modules. Each task could be assigned to any arbitrary control device. The described approach makes it possible to determine the time required for the performance of each task. The number of tasks performed or omitted in connction with a lack of time can be obtained along with the causes for an overload. The results obtained indicate various nonoptimal conditions, which are related to existing design characteristics and an inappropriate division of tasks between man and machine. G.R.

A82-19270 # **Data base generation for digital external view systems (Datenbasisgenerierung für digitale Aussensicht-systeme).** U. List (Bundesamt für Wehrtechnik und Beschaffung, Koblenz, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-101.* 14 p. 6 refs. In German.

Flight simulators make increasing use of systems which provide the pilot with a computer-generated image in simulation of the external scene which the pilot would perceive from the cockpit of the aircraft. Realistic impressions of motion are conveyed. The degree of realism achieved in the image is essentially determined by the processing capacity of the employed system. The realism of representation could be improved in connection with advances in electronics and automatic data processing made during the last few years. A computer-generated image system prototype is discussed along with the data base generation system (DBGS) used with it. Attention is given to the DBGS hardware configuration, the automatic transformation procedure, aspects of interactive processing, and questions of data base verification. The DBGS uses as a basis for its operation magnetic tapes with topographic information along with maps, aerial photographs, and other photographs. G.R.

A82-19271 # **Official recognition and the significance of simulators for safe flight operations (Die behördliche Anerkennung und der Stellenwert von Simulatoren für den sicheren Flugbetrieb).** G. Voss (Luftfahrt-Bundesamt, Braunschweig, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-094.* 8 p. In German.

The evolution of the flight simulator since its first introduction in the 1950s is considered. It is pointed out that the performance of modern flight simulators exceeds greatly the requirements for simulators described in the original definition of the International Civil Aviation Organization. The possibilities provided by the simulators for a replacement of flight training led to regulations by the appropriate authorities in the various countries regarding the use of flight simulators in training leading to the licensing of pilots. Attention is also given to the procedures to be followed for the testing of simulators to obtain official recognition. Test guides and, perhaps, even simulator self-test processes developed by the simulator industry would make it possible to reduce the time and work aerodynamic forces and surface blow back, and 200 types of malfunction. Simulator hardware changes to upgrade the computer, the motion simulation, control loading, sound, and visual fidelity are examined. Finally, actual implementation of the Phase II regulations are discussed, noting that the goal is to make the training simulation experience more thorough than will actually be encountered in flight. M.S.K.

A82-20537 **An independent view of where civil simulation should be headed.** J. A. Carrodus (Cathay Pacific Airways, Ltd., Hong Kong). In: Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981. London, Royal Aeronautical Society, 1981. 5 p.

Deficiencies in the optimal use of simulators are discussed and suggestions for improvements in the use of simulators are offered. The inadequacies in validation documents for testing the fidelity of one variable factor against another in a dynamic program are examined, and a remedy is found in obtaining validation data from the aircraft manufacturer. Recommendations are also offered that simulator construction be given the same lead time as the aircraft they simulate, while manufacturers should also supply qualified pilots who can validate the simulator programs for conditions outside of the normal flight envelope. Error checking is emphasized, as are buffet and motion realism, sound reproduction fidelity, meeting development schedules, and provisions for automatic testing. Finally, maintenance in simulators is reviewed, along with government oversight agencies to uphold the integrity of simulator training. M.S.K.

A82-20540 **Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980.** Symposium sponsored by the Royal Aeronautical Society. London, Royal Aeronautical Society, 1980. 99 p.

Topics discussed include the airworthiness of helicopter transmissions, the application of condition monitoring, and the minimum-cost performance monitoring of turboshaft engines. Consideration is also given to single-shot diagnostics, helicopter transmission philosophy, and on-site vibration measurement, dynamic tracking and balancing. J.F.

A82-20541 # **Airworthiness of helicopter transmissions.** P. D. Vinall (Civil Aviation Authority, London, England). In: Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980. London, Royal Aeronautical Society, 1980. 30 p.

The fatal accident rates caused by the rotor and transmission systems of rotorcraft are almost an order of magnitude worse than those of fixed-wing aircraft. This is in part due to the single load path characteristics of the vehicle. Redundancy in the transmission system would mean, however, a change in the current design practice and the possible disadvantages of increased weight and complexity. The standards achieved on rotorcraft transmissions bear comparison with experience on similar dynamic components in turboprop engines. Safety considerations are of greater significance in a helicopter, however, and these aircraft should have higher standards for airworthiness. It is suggested that there be manufacturing control of critical parts for rotorcraft, and that transmissions not be used as a source of power for accessory functions which might reduce the integrity and reliability of the transmissions. Better diagnostic aids should also be established, including an in-flight indicator of transmission condition and a periodic vibrographic oil and sonic analysis. J.B.

A82-20542 # **The application of condition monitoring.** A. T. Dalton (Civil Aviation Authority, London, England). In: Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980. London, Royal Aeronautical Society, 1980. 14 p.

The development in the application and management of in-service maintenance of commercial helicopters has lagged the advancements in design and operation. The Primary Maintenance Process is discussed in detail, emphasizing its three primary maintenance processes: (1) hard time maintenance for known deterioration; (2) on-condition inspection at regular intervals; and (3) condition monitoring, which relies on in-service information analysis. The primary processes (1 and 2) are applied in detail to each item of a helicopter, after which condition monitoring (3) is used as a secondary surveillance activity for engineering management. It is maintained that formalized application of condition monitoring to safely develop maintenance tasks will reduce costs and promote deregulation by delegation of certain activities to the helicopter operator under controlled program conditions. J.F.

A82-20543 # **Quick learning diagnostics.** R. M. Stewart (Southampton, University, Southampton, England). In: Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980. London, Royal Aeronautical Society, 1980. 14 p.

Single-shot diagnostics implies the ability to judge the state or condition of a component on the basis of one measurement and without reliance on past history. Vibration patterns that signal the existence of a fault and the nondimensional numbers to encode them are found; use of both patterns and numbers reduces the data storage requirement, since the diagnosis is independent of past history, machine speed/load and monitoring position. Noise reduction and multiple techniques are developed to permit inspection of more complex machines. Single-shot diagnostics was used to monitor the vibrations of a gear box and a rolling contact bearing. In the former, the pattern recognition procedure resulted in the production of a true nondimensional number; in the latter, mere detection of the pattern was considered sufficient. Both cases required a great deal of computation, first during the primary phase of signal averaging or power spectrum analysis, and then in the secondary phase of reducing the complicated primary signature to a simple statement: acceptable or unacceptable. J.F.

A82-20544 # **Minimum cost performance monitoring of turboshaft engines.** H. I. H. Saravanamuttoo (Carleton University, Ottawa, Canada). In: Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980. London, Royal Aeronautical Society, 1980. 13 p.

A low-cost Engine Health Monitoring system for turboshaft engines is presented, which is suitable for use by small operators who do not have access to computing facilities. Two approaches are discussed, Gas Path Analysis (GPA) and Trend Analysis, according to which measurements are made of the power fuel flow, inlet conditions, pressure levels, and temperatures. GPA is shown to be the more powerful method, but requires extra instrumentation. Fuel flow errors can be detected either by a large increase in airflow or an increase in turbine efficiency. Fuel flow proved to be the most critical measurement (a 1% error gave a 1.4% error in airflow, whereas a 1% error in power only gave a 0.4% error in airflow). This lower sensitivity to power errors results since GPA deduces the airflow from the gross power developed by both turbines, and power absorbed by the compressor is usually greater than that absorbed by the rotor. Trend Analysis, on the other hand, requires no extra instrumentation, but when applied with good judgement, can indicate troubles before they become critical. J.F.

A82-20545 # **On-site vibration measurement, dynamic tracking and balancing.** N. E. Trigg (Helitune, Ltd., Fleet, Hants., England). In: Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980. London, Royal Aeronautical Society, 1980. 10 p.

Undetected vibration can severely damage expensive and often unobtainable major components, resulting in lengthy, costly, and untimely overhauls. Old and new methods of vibration analysis and tracking are compared, and the various techniques and equipment used by these methods are discussed: flag tracking, hand-held vibrograph, the Scientific Atlanta Vibration Signature Analyzer. The latter instrument provides a hard copy of vibration signatures recorded in the vertical, lateral, and fore and aft planes; by relating the peaks of the signatures to a vibration order sheet, the sources of vibration can be found and sharply reduced. Out-of-track and out-of-balance conditions in the main and tail rotors can be pin-pointed with accuracy and eliminated. The future will involve microprocessors to interpret the data more rapidly and give instructions for speedy tuning. J.F.

A82-20546 # **Helicopter transmission philosophy - The way ahead.** B. A. Shotter (Westland Helicopters, Ltd., Yeovil, Somerset, England). In: Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980. London, Royal Aeronautical Society, 1980. 10 p.

Factors influencing the design of a helicopter transmission system are discussed. The power and speed of the slowest output are of primary importance since these define the maximum torques where the highest weights are likely to be found. The physical arrangement of the aircraft usually demands that the engine axis be near-horizontal, while the main rotor axis be near-vertical; one stage of gearing will therefore be concerned with changing the rotation axis. The physical form of the system is also influenced by the rotor control principles and the nature of the forces emanating from the rotor. The system should also have a light weight, high reliability, a minimum amount of maintenance, and a long life. Improvements in materials can contribute to a consistent performance, and a simple system, based on a large number of units of the same design, will make the unit more problem-free. J.F.

A82-20551 **Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981.** Symposium sponsored by the Royal Aeronautical Society, Royal Institution of Naval Architects, and Airship Association. London, Royal Aeronautical Society, 1981. 114 p.

After giving an historical account of the development of rigid and non-rigid airship design, the conference covers the application of airships to offshore military and economic activities such as those defined by the Third U.N. Conference on the Law of the Sea, the incorporation of modern technologies into maritime patrol airships, comparisons of airships and conventional aircraft in maritime roles off the Japanese Archipelago, and possibile military roles for airships of various designs in the Royal Navy. Consideration is also given the airworthiness of airships under severe flight conditions, the design of a surveillance airship for duty in the area of New Zealand, and the design characteristics and operational capabilities of the Skyship 500 airship. O.C.

A82-20552 **An introduction to the airship.** E. Mowforth (Airfloat Transport, Ltd., Guildford, Surrey, England). In: Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981. London, Royal Aeronautical Society, 1981. 8 p.

This paper seeks to indicate some of the principal design parameters and operational characteristics of the airship, making particular reference to those features relevant to maritime applications. The greater part of the presentation is devoted to the traditional airship geometry, typified historically by for example the Goodyear 'blimps' and the Hindenburg'; structural categories for this form will first be described, leading to a survey of selected operational aspects, a brief historical account of the use of airships in a maritime context, and some comments on the performance to be expected from the conventional configuration. The paper will then conclude with a short look at some of the modern proposals deviating from the traditional concept, particularly at 'hybrid' designs. (Author)

A82-20553 **Offshore uses of the airship.** M. B. F. Ranken (Aquamarine International /Fisheries and Ocean Development/, Ltd., London, England). In: Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981. London, Royal Aeronautical Society, 1981. 12 p. 42 refs.

An assessment is made of the application of airships to the maritime surveillance tasks made neccessary by the definition of exclusive economic zones (EEZs) for coastal states by the Third U.N. Conference on the Law of the Sea. It is suggested that the fuel economy, long mission durations, and large horizon for radar use make airships attractive tools in the implementation of surveillance within the EEZs. Attention is given the construction, operation and crew training cost advantages of airships, the ease with which avionics and specialized electronic surveillance equipment can be accomodated in an airship gondola, and the all-weather operational capabilities of modern airships. O.C.

A82-20554 **Studies of modern technology airships for maritime patrol applications.** D. B. Bailey (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA), K. E. Williams, and L. J. Nivert (U.S. Coast Guard, Washington, DC). In: Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981. London, Royal Aeronautical Society, 1981. 12 p. 24 refs.

The energy efficiency of airships has prompted the reexamination of their capabilities in maritime patrol roles, in light of competition from hydrofoil, surface effect, and small waterplane area ship designs. Based on the past performance of airships and the incorporation of modern technology for propulsion, structures, materials and flight controls, it is assumed that the new airships would be capable of hover, VTOL operation, a 90-knot maximum speed, sensor and vessel towing, and all-weather flight. The lifting gas considered is 95% pure helium. Studies concerning vehicle sizing, estimated life cycle costs, and vehicle case studies are invoked by conclusions which recommend that (1) airship flight demonstrations be conducted for technical and operational validation, and (2) that analyses be conducted of such operational and logistic factors as crew training, maintenance, basing and utilization. O.C.

A82-20555 **The airship - Its application and promotional activity.** K. Iinuma (Japan Buoyant Flight Association, Japan). In: Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981. London, Royal Aeronautical Society, 1981. 7 p.

The opportunities for airship operation in the Japanese Archipelago are assessed, with a view toward more economical fulfilment of territorial waters control and maritime surveillance requirements than present YS-11 and 737 conventional aircraft. Attention is given the use of airships in traffic between the main islands and small outlying islands. The airship design assumed in all comparisons and estimates is a four-rotor, helistat-type craft incorporating a buoyant hull with vectorable, helicopter-like propellers. O.C.

A82-20556 **The uses of airships in the Royal Navy.** B. Shaw (Ministry of Defence /Navy/, London, England). In: Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981. London, Royal Aeronautical Society, 1981. 6 p. 7 refs.

An assessment is given of the operational capabilities offered by airships incorporating new materials and novel design concepts, in the context of the NATO roles to which the British Navy is commited in the North Atlantic. In addition to considering ASW, mine warfare, flying command communications center and RPV-carrying functions, attention is given to the structural design of an airship whose service altitude would be 15,000 ft. The structural configuration consists of a carbon fiber-reinforced plastic central beam, which would support the hull envelope by means of circular frames attached to the beam by radial wires. Design suggestions are also made for a low-level airship with four vectorable rotors. Emphasis is placed on the advantages of airships in the airborne early warning role and in the role of logistics support for ships at sea. O.C.

A82-20557 **Airworthiness of airships.** E. J. Niedermayer (Civil Aviation Authority, London, England). In: Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981. London, Royal Aeronautical Society, 1981. 6 p.

Criteria under consideration by the British Civil Aviation Authority with a view of establishing airship airworthiness and safety requirements for certification of future commercial designs are presented. Emphasis is put on the airship hull's ability to withstand storm-strength gust conditions, and of the control surfaces' ability to establish sufficient stability under those conditions. It is noted that the velocities of up- and down-drafts in the center of a severe thunderstorm may reach 3000 ft/min at the 3000 ft altitudes at which airships traditionally cruise. Attention is also given to the free-balloon condition that results from total engine failure, and to the establishment of operational limitations concerning maximum rates of climb and descent, minimum turn radii, and minimum clearance space for take-off and landing. O.C.

A82-20558 **A surveillance airship for the New Zealand environment.** P. W. C. Monk (Airship Industries, Ltd., Isle of Man, *Sinica*, vol. 2, Sept. 1981, p. 84-93. In Chinese, with abstract in English.

The results of a simulation study of a triple redundant flight control system are reported. The system featured the capability of fail-operation and employed three on-line signal selectors, six off-line comparators, and an active standby servomechanism. The signal selector consisted of operational amplifiers, and the triplex system involved the selection of an intermediate voltage transmitted among three input signals. All failure signals were isolated and neglected, while a servo loop was employed to compare a servo model with the active-standby servomechanism. The signal selectors, comparators, and servomechanism provided adequate performance, within the bounds that the active-standby servomechanism be limited to control functions which accept small failure transients. M.S.K.

A82-22198 † **The use of Doppler spectroscopy to study the characteristics of the polydisperse characteristics of emulsion water and solid microimpurities in aviation fuels (Primenenie metoda Doplerovskoi spektroskopii dlia issledovaniia kharakteristik polidispersnosti emul'sionnoi vody i tverdykh mikroprimesei v aviatoplivakh).** A. N. Korolevich, T. V. Oleinik, and A. Ia. Khairullina. *Zhurnal Prikladnoi Spektroskopii*, vol. 35, Dec. 1981, p. 1016-1023. 11 refs. In Russian.

The feasibility of using Doppler spectroscopy to determine drop sizes of emulsion water and particle sizes of solid microimpurities in kerosene flow through a pipe is confirmed. Measured Doppler spectra are used to reconstruct particle size distribution functions for fractions of microparticles beginning with 2 microns. The method makes possible the rapid continuous monitoring of the disperse phase in aviation fuel and may be suitable in the automated analysis of multicomponent disperse media. B.J.

A82-22209 # **Rotating stall in blade rows operating in shear flow.** T. Sekido (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan), I. Sasaki, and H. Takata (Tokyo, University, Tokyo, Japan). *JSME, Bulletin*, vol. 24, Dec. 1981, p. 2074-2081.

The nature of the unsteady small perturbations in a sheared mean flow with a linear velocity profile is investigated. The results are used to analyze the actuator-disk of a rotating stall in three-dimensional blade rows which are placed in cartesian coordinates and are exposed to a spanwise shear flow. It is assumed that the blades have no twist and that the aerofoil section does not vary with radius. The axial velocity is continuous everywhere on the actuator plane, and the exit flow angle is constant as well as independent of both the inlet flow angle and the spanwise position. The total pressure loss is assumed to arise through the blade row, and is related to the flow by the total pressure loss coefficient. It is shown that the three-dimensional effect in shear flow greatly changes the nature of the rotating stall. Spanwise distribution of the disturbances of the rotating stall in shear flow is also examined. J.F.

A82-22222 **Can low-speed jet noise be predicted (Peut-on prédire le bruit d'un jet quelconque de faible fitesse).** J. M. Fitremann (Ecole Nationale Supérieure de Mécanique, Nantes, France). *(Association Aéronautique et Astronautique de France, Colloque d'Acoustique Aéronautique, 7th, Ecole Centrale de Lyon, Ecully, Rhône, France, Nov. 4, 5, 1980.) Revue d'Acoustique*, vol. 14, no. 58, 1981, p. 145-152. 18 refs. In French.

Attempts to analytically define the noise emitted by a turbulent jet and the refraction of noise off the surface of an aircraft are discussed. Modeling turbulent flow for a given geometry is nominally accomplished by applications of theories of radiation and turbulent shear flow, and of three-dimensional refraction phenomena. Turbulent flow is calculated from average flow, energy, dissipation, and time and length scales, with reference to known flows, and by making quadruple correlations; stress, mixed, algebraic, and linear diffusion models are possible. Turbulent spectral quantities are calculated at discrete points volumetrically, and the spatial and temporal characteristics are quantified as the acoustic spectra diverge from the main flow. Inhomogeneous radiation is described by Lighthill's theory. Nonlinear propagation phenomena are quantified in terms of fields of average velocities or densities, of simple or nonlinear, multiple diffusion, for random fluctuations in amplitude and phase, and from spectral broadening of pure frequencies during refraction. M.S.K.

A82-22240 * **Deposit formation in liquid fuels. II - The effect of selected compounds on the storage stability of Jet A turbine fuel.** J. H. Worstell and S. R. Daniel (Colorado School of Mines, Golden, CO). *Fuel*, vol. 60, June 1981, p. 481-484. 30 refs. Grant No. NsG-3122.

The influence of substituted pyridines, pyrroles, indoles, and quinolines on the storage stability of conventional Jet A turbine fuel is evaluated. Significant increases in the amount of deposit formed in accelerated storage tests are found upon addition of these compounds at levels as low as one ppm nitrogen. While the effect is correlated with basicity of the nitrogen compound within a given compound class, the correlation does not hold between classes (pyridines, quinolines, etc.). Steric hindrance at the nitrogen atom greatly inhibits deposit promotion. The characteristics, but not the elemental composition, of deposits vary with the identity of the added nitrogen compound and with deposition temperature. (Author)

A82-22241 * **Deposit formation in liquid fuels. I - Effect of coal-derived Lewis bases on storage stability of Jet A turbine fuel.** K. E. Dahlin, S. R. Daniel, and J. H. Worstell (Colorado School of Mines, Golden, CO). *Fuel*, vol. 60, June 1981, p. 477-480. 24 refs. Grant No. NsG-3122.

The development of reasonably precise techniques for the measurement of storage stability of jet aviation fuel is described. Lewis bases, extracted by ligand-exchange from a coal-derived liquid, are shown to adversely affect storage stability (as determined by an accelerated storage test) when added to Jet A turbine fuel. JFTOT results suggesting slight decreases in thermal stability of fuel 'spiked' (i.e., contaminated with a measured quantity of reagent) with extract are reported. Addition to Jet A turbine fuel of individual heterocyclic nitrogen compounds is shown to produce comparable decreases in storage stability. (Author)

A82-22245 # **Aerodynamic evaluation of winglets for transport aircraft.** J. A. Dahlin (Douglas Aircraft Co., Long Beach, CA). *American Institute of Aeronautics and Astronautics, Fluid and Plasma Dynamics Conference, 14th, Palo Alto, CA, June 23-25, 1981, Paper 81-1215.* 7 p. 8 refs.

The applications of winglets to new and existing transport aircraft are discussed. The calculation of induced drag of highly nonplanar lifting configurations (i.e. wing/winglet combinations) using the Trefftz-Plane (far-field) method is substantiated. Further, it is established that the method of surface pressure integration to calculate induced drag characteristics is unreliable. A trade study evaluating the effects of winglet dihedral and span on induced drag and wing root-bending-moment characteristics is presented. The effect of wing loading on winglet performance and the resulting implications to existing transport aircraft is discussed. Comparisons of predicted and measured (wind tunnel and flight) induced drag improvements due to winglet and wing-tip extensions are presented for the KC-135 and DC-10 aircraft. (Author)

PREDESIGN STUDY FOR A MODERN 4-BLADED ROTOR FOR THE NASA ROTOR SYSTEMS RESEARCH AIRCRAFT
H. E. Bishop, J. E. Burkam, R. C. Hemingway, C. N. Keys, K. E. Smith, J. H. Smith, and J. A. Staley Jan. 1981 312 p refs
(Contract NAS2-10689)
(NASA-CR-166153) Avail: NTIS HC A14/MF A01 CSCL 01B

Trade-off study results and the rationale for the final selection of an existing modern four-bladed rotor system that can be adapted for installation on the Rotor Systems Research Aircraft (RSRA) are reported. The results of the detailed integration studies, parameter change studies, and instrumentation studies and the recommended plan for development and qualification of the rotor system is also given. Its parameter variants, integration on the RSRA, and support of ground and flight test programs are also discussed. Author

PRE-DESIGN STUDY FOR A MODERN FOUR-BLADED ROTOR FOR THE ROTOR SYSTEM RESEARCH AIRCRAFT (RSRA) Final Report
Charles W. Hughes and Andrew H. Logan Mar. 1981 140 p refs
(Contract NAS2-10690)
(NASA-CR-166154) Avail: NTIS HC A07/MF A01 CSCL 10A

Various candidate rotor systems were compared in an effort to select a modern four-bladed rotor for the RSRA. The YAH-64 rotor system was chosen as the candidate rotor system for further development for the RSRA. The process used to select the rotor system, studies conducted to mate the rotor with the RSRA and provide parametric variability, and the development plan which would be used to implement these studies are presented. Drawings are included. A.R.H.

SUMMARY OF THEORETICAL CONSIDERATIONS AND WIND TUNNEL TESTS OF AN AERODYNAMIC SPOILER FOR STALL PROOFING A GENERAL AVIATION AIRPLANE
Howard L. Chevalier Jan. 1982 55 p refs
(Grant NsG-1407)
(NASA-CR-165100) Avail: NTIS HC A04/MF A01 CSCL 01A

An airplane stall proofing system utilizing a spoiler was investigated for application on a low wing airplane representative of typical general aviation aircraft. Tests of the full scale airplane were conducted in the NASA Langley 30 x 60 foot full scale wind tunnel. The test velocity was 86 feet per second, corresponding to a Reynolds number of 2.20 million. The stall proofing capability of the spoiler is shown and a theoretical approach to the design of the spoiler and analysis of the spoiler's contribution to the airplane's trim and longitudinal stability is verified. Controlled spoiler deployment in a narrow angle of attack range, 4 degrees, immediately preceding the stall angle will stall proof the airplane. The results also show some of the limitations of flight tests to determine spoiler deployment rate for good handling qualities. M.G.

APPLICATION OF IMAGE PROCESSING TECHNIQUES TO FLUID FLOW DATA ANALYSIS
Charles C. Giamati 1981 16 p Presented at the 11th Ann. Computer Output Microfilm (COMtec) Conf., Lincolnshire, Ill., 24-26 Feb. 1981
(NASA-TM-82760; E-1081) Avail: NTIS HC A02/MF A01 CSCL 01A

The application of color coding techniques used in processing remote sensing imagery to analyze and display fluid flow data is discussed. A minicomputer based color film recording and color CRT display system is described. High quality, high resolution images of two-dimensional data are produced on the film recorder. Three dimensional data, in large volume, are used to generate color motion pictures in which time is used to represent the third dimension. Several applications and examples are presented. System hardware and software is described. M.G.

SOME EXPERIMENTAL INVESTIGATIONS ON TRANSONIC FLUTTER CHARACTERISTICS OF THIN PLATE WING MODELS WITH SWEPTBACK AND TAPERED TIPS
Eiichi Nakai Sep. 1981 49 p refs In JAPANESE; ENGLISH summary
(NAL-TR-682; ISSN-0389-4010) Avail: NTIS HC A03/MF A01

Some experimental investigations on the transonic flutter characteristics were conducted using thin plate cantilevered wing models with sweptback tapered tips, which were elastically supported at the root, in the NAL 0.6m x 0.6m transonic blowdown wind tunnel for flutter testing in the range of Mach numbers from 0.804 to 1.171. The wing models have the tip planform of sweptback angles of 35 degrees at the leading edge and 30 degrees at 1/4 chord line, and an aspect ratio of 1.017 and a taper ratio of 0.6. It is concluded that the flutter boundaries of the wing models have been obtained and the boundaries expressed by the 'experimental flutter speed coefficient' are characterized as having minimum values at around Mach number 1.0. It is also concluded that the considerable increase in the flutter instability area is caused by the decrease in the stiffness of the elastic support at the root of the model. Author

THE PREVALENCE OF VISUAL DEFICIENCIES AMONG 1979 GENERAL AVIATION ACCIDENT AIRMEN
J. R. Dille and C. F. Booze, Jr. Jul. 1981 10 p refs
(AD-A106489; FAA-AM-81-14) Avail: NTIS HC A02/MF A01 CSCL 01/2

Analyses of the accident experience of pilots who were monocular, did not meet (even the liberal) vision standards, had color vision defects and no operational restrictions, or wore contact lenses, have shown higher-than-expected accident experience in previous studies. However, no causal role had been assigned by accident investigators and reexamination of the records failed to show any obvious pattern or relationship between the defects and the accidents. In the present study of 1979 accidents, the relatively small number of pilots with aphakia and artificial lens implants, as well as the total eye pathology population, had significantly higher accident rates, but the monocular pilots did not. Again, no causal role had been ascribed. Some associations are debatable, but there is no clear recurring problem. There are still unresolved questions about the consistent operational performance of monocular pilots, those who are not fully corrected to 20/20 distant visual acuity bilaterally, airmen with near vision deficiencies only who are not required to wear corrective glasses, those without fusion, and several with appreciable pathology who have 20/20 corrected central visual acuity but about whom we know very little concerning their dynamic, peripheral, depth or accommodative function. A GENERALIZED ESCAPE SYSTEM SIMULATION COMPUTER PROGRAM: A USER'S MANUAL Final Report
Louis A. DAulorio, Kathleen M. Breakey (Computer Sciences Corp., Huntington Valley, Pa.), Shirley W. Trimble (Computer Sciences Corp., Huntington Valley, Pa.), and Bruce Waldron (Computer Sciences Corp., Huntington Valley, Pa.) Aug. 1981 105 p
(Contract N62269-78-C-0191)
(AD-A106152; NADC-81224-60) Avail: NTIS HC A06/MF A01 CSCL 01/3

The Generalized Escape System Simulation Computer Program was developed to simulate the operation of various ejection seats.

an open, level field about 7 nautical miles east southeast of Madisonville, Texas. Witnesses heard a small explosion and saw the aircraft descend from a dark cloud; the wings and the empennage were not attached during the observed portion of the aircraft's descent. The pilot and the two passengers were killed. The aircraft was destroyed. The National Transportation Safety Board determines that the probable cause of the accident was a pilot induced airframe overload following loss of aircraft control which resulted in the structural breakup of the aircraft. The reason(s) for the loss of aircraft control could not be determined. Contributing to the loss of control was the pilot's lack of instrument proficiency in multiengine aircraft. R.J.F.

AIRCRAFT ICING AVOIDANCE AND PROTECTION
9 Sep. 1981 16 p
(PB82-108135; NTSB-SR-81-1) Avail: NTIS HC A02/MF A01 CSCL 01C

The problems of aircraft icing from the standpoint of icing statistics, the meteorological factors which cause icing, the certification of aircraft by the FAA for the flight into known icing conditions, and the forecasting of icing conditions are investigated. It is noted that icing accidents are a problem primarily for general aviation aircraft and that in addition to the accidental losses due to icing, there are significant operational losses due to inadequacies in the weather forecasting system. The problems revealed can be alleviated, but in order to do so new technology will have to be developed based upon a better understanding of ice formation and improvements in the quality of icing forecasts. TERMINAL AREA AUTOMATIC NAVIGATION, GUIDANCE, AND CONTROL RESEARCH USING THE MICROWAVE LANDING SYSTEM (MLS). PART 2: RNAV/MLS TRANSITION PROBLEMS FOR AIRCRAFT Final Report
Samuel Pines Washington, D.C. NASA Jan. 1982 139 p refs
(Contract NAS1-15116)
(NASA-CR-3511; AMA-80-12-Pt-2) Avail: NTIS HC A07/MF A01 CSCL 17G

The problems in navigation and guidance encountered by aircraft in the initial transition period in changing from distance measuring equipment, VORTAC, and barometric instruments to the more precise microwave landing system data type navaids in the terminal area are investigated. The effects of the resulting discontinuities on the estimates of position and velocity for both optimal (Kalman type navigation schemes) and fixed gain (complimentary type) navigation filters, and the effects of the errors in cross track, track angle, and altitude on the guidance equation and control commands during the critical landing phase are discussed. A method is presented to remove the discontinuities from the navigation loop and to reconstruct an RNAV path designed to land the aircraft with minimal turns and altitude changes. B.W.

REQUIREMENTS FOR INSTRUMENT APPROACHES TO CONVERGING RUNWAYS
L. C. Newman, W. J. Swedish, and T. N. Shimi Sep. 1981 116 p refs
(Contract DTFA01-81-C-10001)
(AD-A108075; MTR-81W230; FAA-EM-82-4) Avail: NTIS HC A06/MF A01 CSCL 01/2

This document discusses the technical issues relevant to converging approaches and examines the feasibility of conducting instrument approaches as a means of increasing airport capacity. The main considerations in the analysis were: runaway geometry; missed approach paths; and pilot acceptance. A safety analysis was conducted to determine requirements and control procedures to provide protection against: random lateral variation from the missed approach path; Heading blunder; and rare and unexpected events. Requirements for final and missed approach are presented as are strategies for applying these requirements to airports with a wide variety of converging runway geometries. Preliminary recommended procedures are presented for conducting independent instrument approaches to Category I minima. GRA

DIFFERENTIAL OMEGA SYSTEM DEVELOPMENT AND EVALUATION Final Report, 27 Aug. 1977 - 15 Aug. 1981
T. M. Watt, L. E. Abrams, and F. G. Karkalik Washington FAA Aug. 1981 105 p refs
(Contract DOT-FA75WA-3662)
(AD-A107857; FAARD-81-69) Avail: NTIS HC A06/MF A01 CSCL 17/7

This report describes a development and evaluation program for Differential Omega in general aviation. The program was a cooperative venture between the FAA and Transport Canada. SCT performed system design, program management, and flight test on behalf of the FAA. Tracor, Inc. provided modified Omega airborne receivers under subcontract to SCT. Flight tests took place in Alaska aboard a Convair 580 provided by the FAA. Monitor stations were located in Anchorage and at Deadhorse. The most definitive results were obtained from flight tests conducted in October 1980 and February 1981. Important results included: (a) data-link range varied from 44 nm to 198 nm, (b) random component of navigation error was 0.25 nm, 2-D RMS, (c) range decorrelation error was about 2 nm over a distance of 550 nm, (d) transient response of the system-following aircraft procedure turns was characterized by a positional overshoot of about 1.5 nm, followed by a monotonically decreasing error with a two-minute time constant. Recommendations are made for improving system performance. Author (GRA)

ACTIVE BEACON COLLISION AVOIDANCE LOGIC EVALUATION. VOLUME 2: COLLISION AVOIDANCE (BCAS) THREAT PHASE Final Report, Apr. 1979 - Jun. 1980
A. Adkins, J. Thomas, B. Billmann, and J. Windle Sep. 1981 59 p refs
(FAA Proj. 052-241-320)
(AD-A107805; FAA-CT-80-51-2-Vol-2; FAA-RD-80-125-2) Avail: NTIS HC A04/MF A01 CSCL 01/2

The purpose of this project was to evaluate and refine the April 1979 version of the Beacon Collision Avoidance System (BCAS) logic prior to Active BCAS prototype flight testing. The April 1979 version of the BCAS logic added changes to support multiple aircraft conflict resolution, Conflict Indicator Register (CIR) interfacing and new surveillance logic interfacing. The results of the first phase of the Active BCAS logic, evaluating the Air Traffic Control Radar Beacon System (ATCRBS) threat phase, identified several improvements that should be made to the BCAS logic. These improvements were incorporated into the logic prior to beginning the second phase, the BCAS equipped threat phase. The second phase was conducted from September to November 1979 and was designed to evaluate the BCAS performance against BCAS equipped threats. The results are presented in this report. Several logic improvements have been identified. These changes have been implemented in both the threat logic and the BCAS command coordination logic (CIR logic). In general, BCAS performance for equipped threats was not as sensitive to vertical rate tracker noise as in the ATCRBS threat case. Resolution performance has been improved through a reduction in undesirable BCAS alarms and by reducing excessive separation with the inclusion of a projected vertical miss distance (VMD) filter for equipped threats. A better method of selecting threat volume parameters has been incorporated. GRA

INVESTIGATION OF WILCOX MODEL 585B VERY HIGH FREQUENCY OMNIDIRECTIONAL RADIO RANGE (VOR) SYSTEM, PART 3 Final Report, Mar. 1980 - Feb. 1981
Wayne E. Bell Oct. 1981 53 p refs
(FAA Proj. 041-305-830)
(AD-A107855; FAA-CT-81-46; FAA-RD-81-52; ACT-100) Avail: NTIS HC A04/MF A01 CSCL 17/7

A three-part investigation of the Wilcox 585B Very High Frequency Omnidirectional Radio Range (VOR) System was conducted. In Part 1, the magnitude of the ground error was reduced by modification and suitable adjustment of antenna element lengths of the field detector. In Part 2, investigation developed an acceptable calibration procedure for system 30 hertz (Hz) modulation. Obtaining compatible 30 Hz modulation reading between aircraft (far-field) and edge of counterpoise (near-field) measurements was an additional requirement. In Part 3, tests resolved any discrepancies in the tuning adjustments prescribed by the manufacturer's equipment manuals. This report, which is the last in a series of three, contains an outline of the tests and procedures for setting the lengths of the adjustable field detector elements, a recommended procedure for obtaining compatible near-field and airborne 30 Hz modulation readings, and recommended changes to the manufacturer antenna tuning procedures in order that the system meet required operational tolerances. AERONAUTICAL INFORMATION DATA SUBSYSTEM (AIDS): A GROUND-BASED COMPONENT OF AIR NAVIGATION SERVICES SYSTEMS
Frank W. Fischer 1981 5 p Presented at 11th AIDS Symp., Cologne, 22-24 Sep. 1981 Sponsored by DFVLR
Avail: NTIS HC A02/MF A01

The construction of an air navigation services information data base for internal and external use (airspace users before and during flight) of internally and externally produced information data is advocated. A data bank, which holds all current operational information data, controls the data switching and processing machine which constitutes the data communication subsystem. Benefits of AIDS include costs in data compiling and the provision of precise data for air traffic control, flight planning or rescue operations. Apart from the airlines, AIDS is of most use to general aviation operators. Author (ESA)

USE OF OPTIMIZATION TO PREDICT THE EFFECT OF SELECTED PARAMETERS ON COMMUTER AIRCRAFT PERFORMANCE Progress Report
Valana L. Wells and Richard S. Shevell Feb. 1982 45 p refs
(Grant NAG1-202)
(NASA-CR-168439) Avail: NTIS HC A03/MF A01 CSCL 01C

The relationships between field length and cruise speed and aircraft direct operating cost were determined. A gradient optimizing computer program was developed to minimize direct operating cost (DOC) as a function of airplane geometry. In this way, the best airplane operating under one set of constraints can be compared with the best operating under another. A constant 30-passenger fuselage and rubberized engines based on the General Electric CT-7 were used as a baseline. All aircraft had to have a 600 nautical mile maximum range and were designed to FAR part 25 structural integrity and climb gradient regulations. Direct operating cost was minimized for a typical design mission of 150 nautical miles. For purposes of C sub L sub max calculation, all aircraft had double-slotted flaps but with no Fowler action. (Contract NAS1-16434)
(NASA-CR-165820; LR-29984) Avail: NTIS HC A09/MF A01 CSCL 01C

A study was performed to quantify the potential benefits of utilizing advanced aluminum alloys in commercial transport aircraft and to define the effort necessary to develop fully the alloys to a viable commercial production capability. The comprehensive investigation (1) established realistic advanced aluminum alloy property goals to maximize aircraft systems effectiveness (2) identified performance and economic benefits of incorporating the advanced alloy in future advanced technology commercial aircraft designs (3) provided a recommended plan for development and integration of the alloys into commercial aircraft production (4) provided an indication of the timing and investigation required by the metal producing industry to support the projected market and (5) evaluate application of advanced aluminum alloys to other aerospace and transit systems as a secondary objective. The results of the investigation provided a roadmap and identified key issues requiring attention in an advanced aluminum alloy and applications technology development program. Author

The experimental data were obtained from hover tests for a scaled model of an advanced bearingless main rotor. Both isolated rotor and ground resonance conditions were tested. Test parameters included blade built-in cone and sweep angles, rotor inplane structural damping, pitch link location and fuselage structural damping. Analytical results for the conditions tested were obtained using current Bell Helicopter analyses. In addition, variations in the analytical models were made to assess their impact on the correlation between computed and measured results. Results are presented in tabular and graphical form. T.M.

Results of a 6-month study of standardization criteria and characteristics are presented that may be effectively applied to the Advanced Aircraft Armament System (AAAS) Program. System elements feasibly for standardization are identified. Standardization characteristics for those feasible elements are developed for various levels of standardization (subsystem, module, piece part) and standardization approaches (horizontal, vertical, area, functional, logistical, and cooperative). Alternative standardization characteristics are also postulated and recommendations are formulated for application to the AAAS Program. Author (GRA)

OPTIMAL DOLPHIN HANG GLIDER FLIGHT [OPTIMALER DELPHIN-SEGELFLUG]
E. D. Dickmanns Mar. 1981 71 p refs In GERMAN
Avail: NTIS HC A04/MF A01

Time minimal gliding flight in vertical air currents is discussed. If the vertical current wavelength is large as opposed to the trajectory oscillation taken by an airplane, an optimal flight with approximately n sub z = 1 can be obtained. In short vertical currents the dynamic warming up maneuver in the downwind gives great advantages. During the transition local conditions may interfere. Two fundamentally different control maneuvers of equal value to the sail functions are described. Transl. by E.A.K.

HC A04/MF A01 CSCL 14/2

The design and development of a high durability, intermediate service temperature (< or = 600 F), direct reading transducer for the measurement of aerodynamic heating in the continuous wind tunnels of the von Karman Gas Dynamics Facility is described. This transducer operates on the axial temperature gradient or Schmidt-Boelter measurement concept. Considerable emphasis is placed upon the practical use of finite-element, two-dimensional heat conduction code for analysis of gage behavior rather than the indiscriminate use of invalid exact mathematical solutions. Laboratory evaluation and calibration of prototype transducers at ambient temperature levels varying from 70 to 500 F are discussed. Results of wind tunnel aerodynamic heating measurements using limited numbers of prototype Schmidt-Boelter gages are presented. Recommendations for future work efforts with regard to further development and testing of this measurement concept are discussed. Author (GRA)

Several rotorblades of a horizontal axis windmill are studied both nonoperating under deadweight, and under quasi-stationary loading with constant forces at rated operation, the blades of which have flap and lead-lag freedom as well as flap-pitch coupling. With a suitable mass distribution it is possible to reduce the blade bending moments in the flap direction drastically. The use of aircraft construction materials is considered. Carbon fiber reinforced plastic is the most suitable. Most of the blade models are investigated without lag hinge. The coning angle of rated operation assumed for the layout is reduced considerably for the blade models with lead-lag freedom in order to obtain sufficient centrifugal stiffness in the lag direction. (Contract BMFT-ET-4086-A)

(ISD-270; ISD-244; ISSN-0170-6071) Avail: NTIS HC A04/MF A01

The coupled flap lag motion of a single, rigid rotor blade of a wind energy converter with flap and lag hinges and a coupling of the angle of attack with the flap motion is investigated. The equations of motion are developed under the assumption of linearized quasi-stationary aerodynamic forces. Static and dynamic stability of the coupled flap and lag motion are investigated. The equations are integrated for different cases under cyclic gravitational forces in order to estimate the importance of nonlinear terms and of the error resulting from the linearization of the conservative system. The nonlinear terms can be neglected, as can the effects of cyclic stiffness resulting from gravitational force. Results for nonlinearities arising from aerodynamic forces are inconclusive. (Contract BMFT-ET-4086-A)

(ISD-271; ISD-258; ISSN-0170-6071) Avail: NTIS HC A06/MF A01

For a windmill rotor blade, a linearized system of differential equations of motion is developed, using a finite element idealization of linearized quasi-stationary aerodynamic forces. Constant rotational speed and a rigidly supported hub are assumed. For two rotor blade models, which differ only in their stiffness in lag direction, the complex eigenfrequencies are calculated. The dynamic response of the rotor blades is computed for cyclic gravity loads at rated operation, for a gust, and, in one case, for the tower wake. From the deformation of the structure the stresses at selected points along the blade are calculated. Torque and rotor thrust are determined for one model. Additional stiffness improves stability and lead-lag angles. The coning angle is excellently stabilized by the flap-pitch coupling. Author (ESA)

previously announced as N81-12626 Sponsored in cooperation with International Energy Agency
(Contract BMFT-ET-4086-A)
(ISD-272; ISD-259; ISSN-0170-6071) Avail: NTIS HC A04/MF A01

A wind rotor was constructed in order to test a data acquisition/transfer system which collects experimental data from the operating model and displays it on a screen. The comparison between the experimental data and the model results is used to check the applied computation methods. The static and dynamic analyses of the rotor model are considered. An 11% difference between experimental and model results is shown. A response problem with variable stiffness in time which arose during the dynamic analysis is solved by setting the structural stiffness constant over small time intervals, diagonalizing the time interval considered and integrating. After integration the solutions of the generalized degrees of freedom are transformed back into the physical system, using the time interval eigenvectors.

LOADING CYCLES AND MATERIAL DATA FOR THE LAYOUT OF A WIND TURBINE OF SPECIAL HUB CONCEPT Final Report
J. H. Argyris and K. A. Braun 1980 38 p refs Transl. into ENGLISH of "Lastwechselzahlen und materialwerte fuer die auslegung einer windturbine spezieller nabenkonstruktion" Rept. ISD-260 Stuttgart Univ., Stuttgart, Jun. 1979 38 p Original report in GERMAN previously announced as N81-12627 Sponsored in cooperation with International Energy Agency
(Contract BMFT-ET-4086-A)
(ISD-273; ISD-260; ISSN-0170-6071) Avail: NTIS HC A03/MF A01

The number of loading cycles of a rotor blade was estimated in order to assess allowable blade stress. Fatigue strengths and allowable stresses are calculated for aeronautic construction materials. Using wind data, the number of starts and stops was estimated. With a guess for the number of revolutions necessary to reach stationary operation from standstill, the number of loading cycles was determined, using the blade aerodynamics. The number of operational hours gives the number of loading cycles for rated operation. Rotation speeds of 1.67 and 2 rad/sec are considered. For 1.67, the number of loading cycles during stationary operation = 2.06 x 10 to the 8th power; during starts and cut offs = 357,000. For 2 rad/sec, results are 2.47 x 10 to the 8th power and 463,000. Stress values, expressed in installed power/sqmm, are: aluminum alloy = 98; stainless steel = 294; glass fiber reinforced plastic = 98; and carbon fiber reinforced plastic = 147.

The international demand for and supply of oil between the years 1980 and 2000 is assessed and future world oil prices and their implications for the price of jet fuel are estimated. Three critical questions are investigated: (1) how long will the world supply of oil continue to keep pace with its demand under likely trends in its use and discovery; (2) at what price will demand and supply clear the world oil market; (3) what does the analysis imply about the price of jet fuel. Projection of oil price is based upon supply and demand, which is consistent with microeconomic analysis.

(NASA-CR-168419) Avail: NTIS HC A07/MF A01 CSCL 09B

The program for the DC 8-D3 flight planning was slightly modified for the three dimensional flight planning for DC 10 aircrafts. Several test runs of the modified program over the North Atlantic and North America were made for verifying the program. While geopotential height and temperature were used in a previous program as meteorological data, the modified program uses wind direction and speed and temperature received from the National Weather Service. A scanning program was written to collect required weather information from the raw data received in a packed decimal format. Two sets of weather data, the 12-hour forecast and 24-hour forecast based on 0000 GMT, are used for dynamic processes in testruns. In order to save computing time only the weather data of the North Atlantic and North America is previously stored in a PCF file and then scanned one by one.

required in conducting the initial admission tests for simulators and the required follow-up tests. Improvements in simulation are discussed which would make the simulator even more efficient. G.R.

A82-19272 # **Simulation of modern radar installations in full-mission flight and tactics simulators (Simulation moderner Radaranlagen in Full-Mission-Flug- und Taktiksimulatoren).** H. G. Werner (Messerschmitt-Bölkow-Blohm GmbH, Ottobrun, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-103.* 17 p. In German.

The correct use of the radar systems represents one of the most important functions of the crew of modern bomber aircraft. The simulation of radar display and radars signals for other systems comprises, therefore, an essential part of the work load of the simulators. Terrain profiles are produced with the aid of a digital terrain data base, taking into account suitable antenna models, and the aircraft parameters. The terrain profiles provide the basis for the derivation of the radar echo data. The main function of the Multi-Role Combat Aircraft (MRCA) radar simulation is the generation of a realistic radar display video signal for the Ground Mapping Radar (GMR) and the Terrain Following Radar (TFR). A description is provided of design and functions of the Digital Radar Land Mass Simulator (DRLMS) of the MRCA Operational Flight and Tactics Simulator (OFTS). G.R.

A82-19273 # **Training in the flight and tactics simulator of the Navy Flight Squadron 3 'Graf Zeppelin' (Ausbildung im Flug- und Taktiksimulator des Marinefliegergeschwader 3 'Graf Zeppelin').** J. Zielke. *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper 81-109.* 11 p. In German.

The squadron has 14 antisubmarine warfare aircraft of the type Breguet 1150. The aircraft represents a NATO development, which is also employed by the French, Dutch, and Italian navies. In tactical combat missions the aircraft is employed with a crew of twelve men. The considered training device has been designed for the simulation of antisubmarine warfare situations. The simulation operations are essentially related to tactical basic and advanced training of the crew, the testing of new tactical procedures, and a participation in the tactical combat training program. The use of the simulator made it possible to reduce substantially the time required for actual flight training. The employment of the simulator makes it feasible to represent realistic combat situations which can generally not be economically provided by other means. G.R.

A82-19274 # **Report covering experience obtained at the German Lufthansa with respect to training involving the use of flight simulators (Erfahrungsbericht aus der Schulung mit Flugsimulatoren bei der Deutschen Lufthansa).** G. Wendt (Deutsche Lufthansa AG, Cologne, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Symposium über Schulung mit Flug- und Taktiksimulatoren, Cologne, West Germany, May 20, 21, 1981, Paper.* 17 p. In German.

The use of flight simulators in the basic training of flight crews is steadily increasing. Basically, the reasons for this trend can be divided into three categories, which are related to aspects of safety, efficiency, and economics. Safety is probably the most important factor. The rate of accidents involving the death of persons was found to be nine times higher for training flights than for regular airline flights. Another advantage of training with a simulator is the possibility to provide many abnormal and emergency situations which, in connection with safety considerations, cannot be reproduced in an aircraft. A training involving the use of a simulator is consequently much more realistic and, therefore, more efficient than the training in an aircraft. Advantages of simulator training related to economics become increasingly important with rising fuel costs. G.R.

A82-19300 **Flexibility is offered by XV-15 tilt-rotor concept.** R. R. Ropelewski. *Aviation Week and Space Technology,* vol. 116, Jan. 11, 1982, p. 74-76, 78, 83, 85.

The flight profile flexibility, low pilot work load and relatively low noise and vibration levels for which the XV-15 tilt-rotor VLOL experimental aircraft was designed are confirmed by flight tests. The aircraft uses two three-blade, 25 ft diameter rotors powered by two 1550 shp turboshaft engines for both vertical lift and forward thrust, thereby combining rotary wing and fixed wing aircraft operational capabilities. Attention is given to the 'conversion corridor', or difference between wing stall speed and rotor overstress speed at any given angle of wingtip nacelle tilt angle. With a normal rate of nacelle conversion of 7.8 deg/sec, the nacelles can translate through the full 95 deg of rotation from horizontal to vertical flight in 12-13 sec. It is noted that the dual flight capability of the XV-15 has not called for the introduction of many new flight instruments into the cockpit. O.C.

A82-19305 * # **Analytical prediction of aerospace vehicle vibration environments.** J. F. Wilby and A. G. Piersol (Bolt Beranek and Newman, Inc., Canoga Park, CA). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-29.* 10 p. 11 refs. Members, $2.00; nonmembers, $4.00. Contracts No. NAS5-22832; No. NAS9-15231; No. NAS1-14611; No. NAS1-15426.

Considerable attention has been given recently to the formulation and validation of analytical models for the prediction of aerospace vehicle vibration response to acoustic and fluctuating pressures. This paper summarizes the development of such analytical models for two applications, (1) structural vibrations of the Space Shuttle orbiter vehicle due to broadband rocket noise and aerodynamic boundary layer turbulence, and (2) structural vibrations of general aviation aircraft due to discrete frequency propeller and reciprocating engine exhaust noise. In both cases, the spatial exterior excitations are convected pressure fields which are described on the basis of measured cross spectra (coherence and phase) information. Structural modal data are obtained from analytical predictions, and structural responses to appropriate excitation fields are calculated. The results are compared with test data, and the strengths and weaknesses of the analytical models are assessed. (Author)

A82-19306 # **Modal analysis using helicopter dynamic test data.** N. Giansante (Kaman Aerospace Corp., Bloomfield, CT) and N. Calapodas (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-30.* 9 p. Members, $2.00; nonmembers, $4.00. Army-supported research.

A description is presented of experimental techniques for dynamic test data acquisition and analytical procedures for performing modal analysis. Modal analysis was applied to data acquired from dynamic test of the AH-IG helicopter airframe. Application of the methodology allowed accurate definition of the structure's natural frequencies, generalized modal parameters and complex mode shapes. The AH-IG airframe exhibits complex modes because of the nonproportional distribution of damping resulting from elastomeric isolators and nonstructural access panels on the helicopter. Underlying the technique of modal testing is the principle of the linear decomposition of structural dynamic response into contributions from the natural modes occuring within a specified frequency interval. A measure of the success of a modal analysis technique is the ability to duplicate analytically the measured frequency response data for a given frequency range using the modal parameters extracted from the dynamic test results. In the subject program the dynamic response of the AH-IG was accurately synthesized over a continuous frequency interval attesting to the success both of the experimental and analytical techniques utilized. (Author)

A82-19307 # **Dynamic response of blades and vanes to wakes in axial turbomachinery.** R. N. Tadros and M. Botman (Pratt and Whitney Aircraft of Canada, Ltd., Longueil, Quebec, Canada). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-33.* 8 p. 17 refs. Members, $2.00; nonmembers, $4.00.

A numerical method is presented which allows the calculation of vibratory stresses in blades and vanes of axial turbines and compressors. The viscous wakes of the cascaded stages are defined by means of thin airfoil theory. The flow is incompressible and the cascades have low solidity. The attention is confined to the case of a single stator row upstream of a single blade row. An existing beam-type program is used to calculate structural natural frequencies and modal shapes. Structural and aerodynamic quantities are combined in a Lagrangian formulation in terms of generalized coordinates. The solution of the equations of motion results in generalized displacements and vibratory stresses. Theoretical results for a compressor turbine blade show the effects of some design parameters on the blade vibratory response. The vibratory stress obtained in a strain gauge test indicates a reasonable agreement. (Author)

A82-19310 # **Balancing of flexible rotors by the complex modal method.** S. Saito and T. Azuma (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-46.* 7 p. 22 refs. Members, $2.00; nonmembers, $4.00.

A new calculation method of the modal unbalance response for general flexible rotors in fluid film bearings has been developed by introducing the concept of modal exciting force vector into the usual complex modal method, and the physical meaning of the damping ratio at a critical speed is discussed. Next, application of this method, that correction weights can be determined in only one trial operation, is reported, and positions to measure vibration and to correct unbalance weight are discussed on the basis of the right eigenvector and the exciting factor mode, respectively. Lastly, it is shown by experiments that the proposed balancing method is of use for actual rotors. (Author)

A82-19311 # **Application of the principle of reciprocity to flexible rotor balancing.** M. S. Darlow and A. J. Smalley (Southwest Research Institute, San Antonio, TX). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-49.* 5 p. 7 refs. Members, $2.00; nonmembers, $4.00. Research sponsored by the Mechanical Technology, Inc.

A series of numerical and experimental studies have been conducted to investigate the validity of the principle of reciprocity for real rotordynamic systems in the presence of damping, gyroscopic, and cross-coupling bearing effects. All of the results are found to be consistent with the principle of reciprocity. It is pointed out that by using the principle of reciprocity it is possible to substantially reduce the number of trial mass runs required for influence coefficient balancing or for the unified balancing approach, a recently developed procedure for balancing flexible rotors. V.L.

A82-19314 # **Optimum journal bearing parameters for minimum rotor unbalance response in synchronous whirl.** R. B. Bhat, T. S. Sankar (Concordia University, Montreal, Canada), and J. S. Rao. *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-55.* 6 p. 12 refs. Members, $2.00; nonmembers, $4.00. Natural Sciences and Engineering Research Council of Canada Grant No. A-7104.

The unbalance response of a Jeffcott-type rotor is analyzed with reference to the contributions of hydrodynamic bearing parameters including the bearing diameter, clearance, and the oil viscosity. Optimization of the bearing parameters is carried out using the method of feasible directions. It is shown that by using a four-shoe tilting pad type bearing with a L/D of 0.5, the maximum unbalance response of the original rotor studied can be reduced by 55%. V.L.

A82-19326 # **Development of a correlated finite element dynamic model of a complete aero engine.** R. A. Bellamy, J. C. Bennett, and S. T. Elston (Rolls-Royce, Ltd., Derby, England). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-74.* 8 p. 5 refs. Members, $2.00; nonmembers, $4.00.

This paper presents a particular case study in which a complete RB 211-524 engine carcass and nacelle was modelled using the Rolls-Royce finite element system. This structure was also vibration tested in the laboratory using two independent modal analysis systems. Close correlation between theory and experiment is demonstrated, which gives confidence in the finite element method for prediction of the dynamic properties of a real engineering structure. It also demonstrates that commercial modal analysis systems can measure the dynamic characteristics of such structures with sufficient quality to validate the theoretical models. (Author)

A82-19332 # **Prediction of aircraft interior noise using the statistical energy analysis method.** V. R. Miller (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) and L. L. Faulkner (Battelle-Columbus Laboratories, Columbus, OH). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-102.* 9 p. 18 refs. Members, $2.00; nonmembers, $4.00.

An analytical model is developed to predict the transmission of noise into an airplane interior through the fuselage sidewall by the statistical energy analysis (SEA) method. The fuselage structure is represented as a series of curved, isotropic plates, the isotropic representation resulting from the effects of smearing out the stiffeners. Other complicating effects such as pressurization, acoustic transmission through windows or seal leaks, and aerodynamic excitation are excluded in this effort but could be modeled by these same methods. Evaluation of the model was made using measured full scale acoustic data from both an adhesively bonded and a mechanically fastened airplane fuselage structure. Reasonably good agreement was obtained between predicted and measured levels in the higher frequencies. Predicted levels were shown to be sensitive to the value chosen for structural loss factor. Comparisons were also made with the measured data with an estimation procedure reported in the literature. (Author)

A82-19333 # **A CAD/CAM graphics system with relative datums and tolerances.** J. P. Memery, W. R. Marler, and J. D. Lancaster (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-108.* 6 p. 10 refs. Members, $2.00; nonmembers, $4.00.

An interactive graphic design system for turned parts in use at Pratt & Whitney Aircraft is described. This CAD/CAM system is capable of capturing relative datums and tolerances required for the manufacture and inspection of these parts. Tolerance capacity allows application of the system to broaching, a process which is commonly used to produce the parts. In the CAD/CAM system, turned parts and bladed disk attachment cross-section profiles are created in the computer. The required position of the attachment root can be calculated to minimize moments created by centrifugal force and air loads on the airfoil. The leakage area between the blade root and the disk slot can be computed, and the weight of the finished part estimated. The computer description is stored in the CAD/CAM data base and identified on the engineering drawing. More than 20 design and manufacturing application modules are currently in place as part of the Pratt & Whitney Aircraft CAD/CAM system. J.F.

A82-19337 * # **Aeroelastic characteristics of a cascade of mistuned blades in subsonic and supersonic flows.** R. E. Kielb (NASA, Lewis Research Center, Structural Dynamics Section, Cleveland, OH) and K. R. V. Kaza (NASA, Lewis Research Center, Cleveland; Toledo, University, Toledo, OH). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-122.* 12 p. 19 refs. Members, $2.00; nonmembers, $4.00.

An investigation of the effects of mistuning on flutter and forced response of a cascade in subsonic and supersonic flows is presented. The aerodynamic and structural coupling between the bending and torsional motions and the aerodynamic coupling between the blades are included. It is shown that frequency mistuning always has a beneficial effect on flutter. Additionally, the results indicate that frequency mistuning may have either a beneficial or an adverse effect on forced response, depending on the engine order of the excitation and Mach number. (Author)

A82-19338 # **Natural frequencies of rotating bladed discs using clamped-free blade modes.** S. J. Wildheim (Stal-Laval Turbin AB, Finspang, Sweden). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-124.* 11 p. 16 refs. Members, $2.00; nonmembers, $4.00.

A method for calculating the natural frequencies of practical bladed disk assemblies is described, which is based on a dynamic substructuring technique. The out-of-plane vibrations of the rotating prestressed disk are described by receptances, while the blade

England). In: Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981. London, Royal Aeronautical Society, 1981. 31 p.

A description is presented of a small, non-rigid airship, which may be fueled by a combination of natural gas and liquid petroleum gas, intended to meet the territorial waters patrol requirements that have arisen through the imposition of a 200-mile economic zone around the islands of New Zealand. The non-metallic airship hull is suited for the installation of a 12-ft wide radar antenna, which will at an altitude of 4000 ft detect 11,000 sq ft targets at 100 n.mi. Attention is given to the structural design of the Kevlar-cloth hull, and to the management of thrust between a reciprocating powerplant for stationkeeping and two turboprop engines for 90-knot dash speeds. Performance projections are given for (1) combined weight of power units and fuel vs. range, (2) search capability vs. target area, (3) time on station at 40 knots and 4000 ft, (4) static stability, (5) speed as a percentage of engine power, and (6) lift derived from the hull at varying angles of attack and from the vectoring of the turboprop engines. O.C.

A82-20559 **Skyship 500 - The development of a modern production airship.** R. Munk (Airship Industries, Ltd., London, England). In: Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981. London, Royal Aeronautical Society, 1981. 11 p.

A description is presented of the structure, systems, performance capabilities and possible missions of the Skyship 500 and 600 non-rigid airships. Hull envelope construction is unusual in that it combines a single-ply fabric with the use of longitudinal fabric panels in which the warp of the fabric also runs longitudinally rather than transversely, as has been the case traditionally. Collapsible ballonets are used fore and aft, and helium is employed as the lift gas. The gondola is constructed from Kevlar-reinforced epoxy, and incorporates vectorable ducted propellers driven by reciprocating engines on each side. A production-costs breakdown is given for all structural components and systems, and disposable-load figures under two assumed lift volumes are provided. The suitability of the craft is considered for maritime surveillance, ASW and mine sweeping roles. O.C.

A82-20560 **Design for military aircraft operability; Proceedings of the Symposium, London, England, February 7, 1980.** Symposium sponsored by the Royal Aeronautical Society. London, Royal Aeronautical Society, 1981. 58 p.

Topics related to the design, maintenance, operability, and reliability of combat aircraft for the RAF are discussed. Specific attention is paid to front-line maintenance requirements, including the reduction of the numbers of necessary on-hand parts and the turnaround time. Management methods for reliability and maintenance are reviewed, as are particular aircraft design features which enhance operability, such as in the avionics systems. The interface between the procurement agencies, the manufacturers, the design teams, and the end users is explored, noting the effectiveness of contracts with specified reliability and MTBF requirements, and the techniques of producing combat-ready aircraft during peacetime conditions are outlined. M.S.K.

A82-20561 **Design for operability of military aircraft RAF engineering experience and requirements. I - Thoughts of a squadron engineer.** B. Robson (RAF, London, England). In: Design for military aircraft operability; Proceedings of the Symposium, London, England, February 7, 1980. London, Royal Aeronautical Society, 1981. 5 p.

Factors which contribute to aircraft reliability are examined, with emphasis on first-line maintenance requirements. Mobility requirements are met by reducing the total amount of equipment that must be brought to the point of use, while on-board electronic systems checks, redundancy, and the ease of repairability are essential to reducing the amount of spares necessary on-hand. Reliability can be considered in terms of ease of repair external to combat damage, and resistance to foreign object damage, in addition to fault diagnosis procedures to save time in identifying defective components. Maintainability is discussed in terms of cost, manpower, time and equipment, and impinges on the efficiency of turnaround time. It is noted that the standardization of parts and tools have significantly aided the reduction of repair time for various aircraft. M.S.K.

A82-20562 # **Aircraft operability - RAF engineering experience and requirements. II.** D. Williams (RAF, London, England). In: Design for military aircraft operability; Proceedings of the Symposium, London, England, February 7, 1980. London, Royal Aeronautical Society, 1981. 6 p.

The procurement cycle, engineering information, and day-to-day nominal operational procedures of combat aircraft maintenance are reviewed to form a basis for requirements for reliability and maintenance. The procurement cycle is outlined, with emphasis on development costs and production costs and timescales. Engineering data are gathered to predict the expected extent and time of repair of nominal breakdowns and operational damage. Specifications for MTBF are promulgated, and plans are defined for ground service testing, built-in test equipment, automatic test equipment, and all factors which consume time before readiness. All necessary components, times, and teams necessary to fulfill maintenance requirements are detailed, and definitions of reliability are set down. Emphasis is placed on tying reliability and maintenance requirements to contractual guarantees. M.S.K.

A82-20563 # **Aircraft design for operability.** H. A. G. Waugh (British Aerospace Public, Ltd., Co., Kingston-on-Thames, Surrey, England). In: Design for military aircraft operability; Proceedings of the Symposium, London, England, February 7, 1980. London, Royal Aeronautical Society, 1981. 4 p.

The design of fighter aircraft is examined for modifications necessary in the design process to obtain maximum operability. Noting that aircraft are growing larger and requiring greater thrust, the tendency of organizations to resist change where change is needed is emphasized. Contractual guarantees for reliability and maintenance, performance standards, price, and fixed schedules created a perception of the necessity for changes to occur early in the design process. Changing standards in the middle of the design process also added to the workload and affected the level of understanding between the user and the manufacturer. Continued communications between the procurement agency, the end users, and the manufacturing team is stressed as necessary to achieving the cost, reliability and maintenance, and performance goals for new aircraft. M.S.K.

A82-20564 # **Operability of military aircraft - Avionic design aspects.** D. I. Jackson and G. Belcher (Marconi Avionics, Ltd., Rochester, Kent, England). In: Design for military aircraft operability; Proceedings of the Symposium, London, England, February 7, 1980. London, Royal Aeronautical Society, 1981. 6 p.

The design, operability, reliability, and maintenance of avionics computers are discussed, with emphasis on ensuring availability in a combat environment. The characteristic accuracy and complexity of modern digital avionics systems are described in terms of an existing autopilot computer, a stability augmentation computer, and two separate display computers. The computers weigh from 25-38 lb, have from 1850-5000 components, draw from 120-180 W, and feature from 240-2800 internal and external connections, with MTBF ranging from 500-2000 hr. Cooling is accomplished through either cold wall or air blown methods, with the high density electronics mounted on module cards for ease of replacement and enhanced cooling. Increasing use of LSI expands the computing power, lowers the power requirements, and offers the potential for higher reliability. A schematic is provided of a reconfigurable system, and an impetus for standard computer languages is noted. M.S.K.

A82-20565 # **Operability of military aircraft - Some design and cost trends.** J. Fletcher and M. S. Wooding (British Aerospace Public, Ltd., Co., Warton Div., Preston, Lancs., England). In: Design for military aircraft operability; Proceedings of the Symposium, London, England, February 7, 1980. London, Royal Aeronautical Society, 1981. 10 p.

Trends, trade-offs, and variabilities in the maintainability, reliability, and survivability of combat aircraft in peacetime conditions are examined. The assurance of quality control before delivery is stressed, while changing components demands are noted to affect the economic continuity of small subcontractor investments in production equipment. A constant feedback is recommended between user operating experience, procurements demands, and designers to support the achievement of performance requirements and reliability, i.e. MTBF. Early, thorough testing of all new components are considered as essential before implementation in aircraft, although the up-front expense is greater. The choice of aircraft stores to minimize weight and size is discussed, along with the placement of arterial passageways to ensure survivability in the case of a strike by employing dispersed pathways and shielding. M.S.K.

A82-20570 **Modelling of target radar scattering with application to guidance simulation.** S. C. Woolcock (EMI Electronics, Ltd., Wells, Somerset, England). In: Trends in missile guidance design concepts; Proceedings of the Symposium, London, England, January 14, 1981. London, Royal Aeronautical Society, 1981. 30 p. 5 refs.

The complexity of the receivable scattering of radar signals from man-made targets is described, and the parameters which have the greatest influence on guidance are outlined. Target-phase fronts are complicated by multireflector scattering returning from complex surfaces, and angular glint occurs when the received return signal is imbedded in the field of several interference signals from reflective surfaces of the perceived target. Ground-based radars experience fluctuations due to polarization or frequency changes in the transmitted signal, range and aspect changes, environmental influences, and depolarization of scattering. Further discussion is devoted to air-to-air guidance systems radar problems, and features of reflective surfaces of typical targets are examined. Finally, the analytic modelling of underwater and guidance radars, as well as radar performance parameters, is presented, along with experimental techniques. M.S.K.

A82-20586 **MLS flare low elevation angle guidance considerations.** R. J. Kelly and E. F. C. LaBerge (Bendix Corp., Communications Div., Baltimore, MD). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 11.1.1-11.1.5. 6 refs.

Aircraft executing an automatic flare maneuever require vertical guidance information to the autopilot at very low altitudes just prior to touchdown. MLS provides the vertical guidance by combining, in the aircraft flare computer, flare elevation angle information with distance measured by DME to determine aircraft height above the runway. This paper addresses the system design considerations for the flare maneuver guidance, giving attention to accuracy requirements, error sources, antenna design considerations, the airborne signal processor, simulation studies, receiver bench tests, and field tests. Since MLS flare guidance accuracy requirements in the presence of ground multipath exceed that provided by the natural resolution of the scanning beam, it is demonstrated that, by using single edge processing and selected antenna height, a + or - 2-foot flare guidance accuracy can be achieved over the touchdown zone. B.J.

A82-20588 **Experimental measurement of the low angle terrain scattering interference environment.** J. E. Evans and D. F. Sun (MIT, Lexington, MA). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 11.3.1-11.3.5. 17 refs. FAA-sponsored research.

The paper presents the results of an experimental study whose aim was to obtain a better quantitative understanding of low angle microwave propagation phenomena needed to assess the potential for improved elevation tracking performance. The experimental data were obtained with a 26-lambda L-band array and a 57-lambda C-band array at a variety of sites in eastern Massachusetts with vegetated and/or rolling terrain. The data were analyzed using the maximum likelihood and maximum entropy methods. It is found that these modern spectral estimation methods, especially the maximum entropy method, can be effectively used for ground reflection elevation multipath characterization. The angular spectra observed to date can be qualitatively and quantitatively predicted by a model based on specular reflections from tilted flat plates. B.J.

A82-20589 **Comparison of various elevation angle estimation techniques.** J. E. Evans and D. F. Sun (MIT, Lexington, MA). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 11.4.1-11.4.5. 8 refs. FAA-sponsored research.

Distributions of multipath scattered power are used to compare several elevation angle estimation techniques: (1) conventional monopulse (CM); (2) off-boresight monopulse (OBM); (3) double null monopulse (DNM); (4) single edge processing (SEP) as used for flare processing in the MLS; and (5) a maximum entropy (ME) technique based estimator. The techniques were applied to several identical data sets, both synthetic and field measured. It is found that the ME technique appeared to yield the best performance if a sufficient number of sensor samples was available. The DNM and SEP appeared to work much better than the CM or OBM for the synthetic data cases. However, in the field measurement results, the DNM and OBM appeared to give similar performance and the SEP performed notably poorer than the other techniques. B.J.

A82-20590 **Tracking of low-altitude targets by a combined X/Ka-band radar system.** L. J. Klaver (Hollandse Signaalapparaten, Hengelo, Netherlands). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 11.5.1-11.5.5. 6 refs.

A historical account is given of how SIGNAAL arrived at a solution to the problem of tracking low-flying targets by a combined X/Ka-band radar system, while suppressing the image effect. In this system, target detection is performed by a normal search radar, and acquisition by the X-band tracking radar. With sufficient video quality, target tracking occurs in the Ka-band. B.J.

A82-20601 # **NAVSTAR global positioning systems.** J. Reynolds and T. McCabe (USAF, Space Div., Los Angeles Air Force Station, CA). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 1. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 21.1.1-21.1.6.

A NAVSTAR system overview is presented. Consideration is then given to concept validation results, Phase I test results, full scale engineering development, test planning, Phase III production and deployment, and applications. B.J.

A82-20615 # **Laser communications via an atmospheric link.** R. S. Mason (USAF, Space Div., Los Angeles Air Force Station, CA). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 2. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 27.1.1-27.1.9. 9 refs.

It is pointed out that interest in communications by laser over either an atmospheric or free space link has existed in the Air Force since the early 70's. The Laser Communications (LaserCom) program is currently in a test and demonstration phase. The Airborne Flight Test System (AFTS) developed in connection with LaserCom is discussed. The transmitter terminal is on board a modified C-135 aircraft. The receiver terminal is located on the ground. The demonstration range is up to 100 km in an altitude window of 33,000-37,000 ft. The airborne laser is a Nd:YAG which operates pulsed, mode-locked, and frequency doubled. The operating wavelength is 5320 A. Typical output power is 150 mW, linearly polarized. The pump source is a potassium arc-type lamp, driven at 250 W. The lamp is recognized as the limiting lifetime component of the system. G.R.

A82-20656 **Land navigation with a low cost GPS receiver.** K. P. Yiu, R. Eschenbach, and F. Lee (Hewlett-Packard Laboratories, Palo Alto, CA). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 55.3.1-55.3.7. 5 refs.

The Navstar Global Positioning System (GPS) is a satellite-based

The program generates a three dimensional trajectory of the ejection seat and its occupant, and is intended to be used in the evaluation of ejection seat design and performance. The program is written in FORTRAN IV and is highly structured for ease of modification and updating. This report outlines the steps necessary to succesfully execute the program. Author (GRA)

TEST AND EVALUATION OF IMPROVED AIRCREW RESTRAINT SYSTEMS
G. T. Singley, III Sep. 1981 352 p refs
(DA Proj. 1L1-62209-AH-76)
(AD-A107576; USAAVRADCOM-TR-81-D-27) Avail: NTIS HC A16/MF A01 CSCL 01/3

US Army aviation accident data shows that a majority of all injuries in attack helicopters could have been avoided if these aircraft had been equipped with crashworthy seat and restraint systems. The compactness of the cockpit and the close proximity of mission equipment to the aircrew in attack and scout helicopters pose serious crash impact hazards. Although not desirable from a crashworthiness standpoint, operational considerations may dictate that mission equipment and structure be located within the occupant's crash impact motion envelope, particularly for his head. The cockpit can be delethalized further when the improved restraint is complemented by padding potential strike surfaces in the cockpit; making contact surfaces frangible; and providing weapon system sights with frangibility, telescoping, and/or swing-away features. This report presents the results of an effort to test and compare the potential of several aircrew restraint systems to reduce the crash impact motion envelope of helicopter aircrewmen. Author (GRA)

SPECIAL INVESTIGATION REPORT. SEARCH AND RESCUE PROCEDURES AND ARMING OF EMERGENCY LOCATOR TRANSMITTER: AIRCRAFT ACCIDENT NEAR MICHIGAN CITY, INDIANA, 7 DECEMBER, 1980
11 Aug. 1981 19 p
(PB81-249427; NTSB-SIR-81-2) Avail: NTIS HC A02/MF A01 CSCL 01B

A special investigation of the circumstances surrounding the crash of a Beechcraft E-90, near Michigan City, Indiana, on December 7, 1980 and of the search and rescue activities following the accident, and the associated operation of the aircraft's emergency locator transmitter (ELT) is presented. As a result of not following proper notification procedures, coordination oversights, and communicaton gaps, the search for the missing aircraft was significantly hampered. The actual crash site was not reached by search personnel until nearly 4 hours after the crash. Some or all of the aircraft's four occupants, who died of hypothermia, probably survived the original crash. Examination of the ELT switch revealed that it was in the OFF position. A rescue could have been effected if the proper authorities had been notified and given the aircraft's last known position. GRA

SPECTRALLY BALANCED CHROMATIC LANDING APPROACH LIGHTING SYSTEM Patent
Wendell D. Chase, inventor (to NASA) Issued 22 Sep. 1981 10 p Filed 10 Dec. 1976 Supersedes N77-12031 (15 - 03, p 0286)
(NASA-Case-ARC-10990-1; US-Patent-4,291,294;
US-Patent-Appl-SN-749420; US-Patent-Class-340-26;
US-Patent-Class-244-114R) Avail: US Patent and Trademark Office CSCL 17G

Red warning lights delineate the runway approach with additional blue lights juxtaposed with the red lights such that the red lights are chromatically balanced. The red/blue point light sources result in the phenomenon that the red lights appear in front of the blue lights with about one and one-half times the diameter of the blue. To a pilot observing these lights along a glide path, those red lights directly below appear to be nearer than the blue lights. For those lights farther away seen in perspective at oblique angles, the red lights appear to be in a position closer to the pilot and hence appear to be above the corresponding blue lights. This produces a very pronounced three dimensional effect referred to as chromostereopsis which provides valuable visual cues to enable the pilot to perceive his actual position above the ground and the actual distance to the runway. TERMINAL AREA AUTOMATIC NAVIGATION, GUIDANCE, AND CONTROL RESEARCH USING THE MICROWAVE LANDING SYSTEM (MLS). PART 3: A COMPARISON OF WAYPOINT GUIDANCE ALGORITHMS FOR RNAV/MLS TRANSITION Final Report
Samuel Pines Washington NASA Jan. 1982 87 p refs
(Contract NAS1-15116)
(NASA-CR-3512; AMA-81-7) Avail: NTIS HC A05/MF A01 CSCL 17G

The results of an investigation carried out for the Langley Research Center Terminal Configured Vehicle Program are presented. The investigation generated and compared three path update algorithms designed to provide smooth transition for an aircraft guidance system from DME, VORTAC, and barometric navaids to the more precise MLS by modifying the desired 3-D flight path. The first, called the Zero Cross Track, eliminates the discontinuity in cross track and altitude error by designating the first valid MLS aircraft position as the desired first waypoint, while retaining all subsequent waypoints. The discontinuity in track angle is left unaltered. The second, called the Tangent Path also eliminates the discontinuity in cross track and altitude and choose a new desired heading to be tangent to the next oncoming circular arc turn. The third, called the Continued Track eliminates the discontinuity in cross track, altitude and track angle by accepting the current MLS position and track angle as the desired ones and recomputes the location of the next waypoint. A method is presented for providing a waypoint guidance path reconstruction which treats turns of less than, and greater than, 180 degrees in a uniform manner to construct the desired path. Author

ATCRBS UPLINK ENVIRONMENT MEASUREMENT NEAR JACKSONVILLE, FLORIDA
F. Nagy, Jr. 25 Sep. 1981 124 p
(Contracts F19628-80-C-0002; DOT-FA72WAI-261; FAA Proj. 052-241-04)
(AD-A108053; ATC-94; FAA-RD-80-70) Avail: NTIS HC A06/MF A01 CSCL 17/7

Airborne measurements of the Air Traffic Control Radar Beacon System (ATCRBS) 1030 MHz uplink environment are described. Measurements were made using the AMF, a special purpose airborne sensor-recorder, during a 23 May 1979 flight in the greater Jacksonville, Florida area. The 2-way flight covered the 450 nm coastline between Fayetteville (NC) and Vero Beach (FL) first at 10,000 then at 25,000 feet. Data recorded at 61 locations have been analyzed to plot combined pulse, interrogation and suppression rates for all locations and individual rates, received powers and angles for 37 locations. Fifty-nine ground interrogators were detected and a list included serves as an all-interrogator/all location (59 x 37) visibility matrix. PRI/PRF distributions of interrogations received are shown at three selected measurement locations. A pulse-by-pulse plot of over 50 Mode 4 interrogations shows their effect on a typical transponder. A worst location is examined for peak instantaneous interrogation rates capable of causing transponder reply-rate limiting (RRL), desensitization and track loss. Durations and periods of recurrence of synchronous jamming for 23 near-equal scan periods are computed. Probabilities of multiple mainbeam coincidences (multi-PRF jamming) are also calculated. Airborne (AMF) and ground based (FAA En-route) coverages are compared, and reported operational problems (target splits, lost tracks, poor coverage) are addressed. Author

AIRCRAFT POSITION MEASUREMENT USING LASER BEACON OPTICS M.S. Thesis - Princeton Univ.
Steven G. Webb 1981 107 p refs
(AD-A107973; AFIT-CI-81-58T) Avail: NTIS HC A06/MF A01 CSCL 17/7

The development of a system to precisely measure the relative position between two aircraft in-flight utilizing a laser beacon, an optical detector array, and on-board microprocessing is examined. The laser beacon board, mounted on the helicopter, consists of two orthogonal fan-shaped narrow width beams, which rotate at a constant four revolutions per second and have fields of view approaching 166 degrees. The photodiode transmits the detected beams, as pulses, to an electronics system where they pass through a band-pass filter and are converted into digital pulses for signal processing. The laser pulses are detected in the presence of background solar interference through optical spectral filtering of the incident light and electronic filtering of the photodiode signal. Initial tests of the laser beacon and the detector optics have demonstrated the potential for their use as elements of a relative position measurement system. GRA

(NASA-CR-137805) Avail: NTIS HC A07/MF A01 CSCL 01C

A comparison of program estimates of wing weight, material distribution, structural loads and elastic deformations with actual Northrop F-5A/B data is presented. Correlation coefficients obtained using data from a number of existing aircraft were computed for use in vehicle synthesis to estimate wing weights. The modifications necessary to adapt the WADES code for use in the ACSYNT program are described. Basic program flow and overlay structure is outlined. An example of the convergence of the procedure in estimating wing weights during the synthesis of a vehicle to satisfy F-5 mission requirements is given. A description of inputs required for use of the WADES program is included. T.M.

(NASA-CR-165813; LG81ER0222) Avail: NTIS HC A11/MF A01 CSCL 01C

The effects of using advanced turboprop propulsion systems to reduce the fuel consumption and direct operating costs of cargo aircraft were studied, and the impact of these systems on aircraft noise and noise prints around a terminal area was determined. Parametric variations of aircraft and propeller characteristics were investigated to determine their effects on noiseprint areas, fuel consumption, and direct operating costs. From these results, three aircraft designs were selected and subjected to design refinements and sensitivity analyses. Three competitive turbofan aircraft were also defined from parametric studies to provide a basis for comparing the two types of propulsion. S.L.

(Contract N00019-80-C-0489)
(AD-A106727; NA-81-290) Avail: NTIS HC A02/MF A01 CSCL 01/3

A fixed price level of effort was performed to install Rockwell's Configuration Development System (CDS) at the Naval Air Systems Command (NAVAIR) facility in Washington, D.C. (Crystal City). Installation of CDS permits NAVAIR the capability to conceptually design aircraft concepts on an interactive graphics terminal and also perform conceptual analysis and concept iteration. Under the contract, the CDS system was converted to run on a VAX 11-780 computer. Program modifications were implemented to allow a greater degree of device-independence, especially for terminal input/output. Also, the CDS program was tested and debugged, the command interpreter was improved, and some additional capabilities were developed. The manual was rewritten including the addition of training materials for classroom and hands-on instruction. Finally, the system was installed and users were trained. Author (GRA)

(AD-A108121; USAAEFA-79-86) Avail: NTIS HC A04/MF A01 CSCL 01/3

The United States Army Aviation Engineering Flight Activity conducted an evaluation of two vibration measuring devices, the Chadwick-Helmuth VIBREX and the Scientific-Atlanta Vibration Signature Recorder, as flight test instrumentation. During the course of those evaluations, it was determined that the Dow Corning E2460-40-1 (redesignated E2976-46) ice phobic coating applied to the rotor blades of a UH-1H helicopter, did not induce undesirable vibrations. It was also concluded that the VIBREX may be used as test instrumentation if the frequencies of interest are already known, and the Scientific-Atlanta device provides good 'quick look' spectral vibration data. DESIGN MANUAL FOR IMPACT DAMAGE TOLERANT AIRCRAFT STRUCTURE
John G. Avery (Boeing Military Airplane Co., Seattle) Oct. 1981 230 p refs Sponsored in part by Dept. of Defense
(AGARD-AG-238; ISBN-92-835-1403-3) Avail: NTIS HC A11/MF A01

The structural design information is grouped into three major sections: description of projectile threats; analysis methods for predicting structural response to projectile impact; and design guidelines for impact tolerance. The hydrodynamic ram effect and aircraft engine disintegration are highlighted.

N82-17161# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
DESCRIPTION OF PROJECTILE THREATS
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 1-24 refs

Avail: NTIS HC A11/MF A01

Evaluating the degradation of aircraft structure resulting from projectile impact requires a knowledge of the threat and encounter conditions. This is necessary in understanding the failure mechanisms and structure response modes induced by the various types of threats. Projectile types, important encounter parameters, and typical terminal effects are discussed. Information that is helpful in understanding the analysis of structural response to impact and the design guidelines for impact damage tolerance is presented. T.M.

N82-17162# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
ANALYSIS METHODS FOR PREDICTING STRUCTURAL RESPONSE TO PROJECTILE IMPACT
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 27-44

Avail: NTIS HC A11/MF A01

Analysis methods and data available for predicting the response of metal and fiber composite structure to projectile impact are presented. The analysis methods discussed are applicable to impacts from small arms projectiles, missile warhead fragments, and the fragmentation and blast effects of high-explosive projectiles. The responses addressed include penetration capability, damage size and type, strength degradation of damaged structure, and internal load redistribution. T.M.

N82-17163# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
ANALYSIS METHODS FOR BALLISTIC DAMAGE SIZE AND TYPE
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 45-78

Avail: NTIS HC A11/MF A01

The parameters which influence the size and character of projectile impact damage are described. Predicting damage size is the first step is assessing the structural capability of impacted structure, since damage size determines net section strength loss, stiffness loss, and the flaw size for failure analysis. The discussion is organized according to projectile type as follows: non-exploding projectiles; high explosive projectiles; and engine debris projectiles. Within each projectile category the responses of both metallic and fiber composite structure are discussed. The effects of fluid pressure in causing damage, a phenomenon known as hydrodynamic ram, are discussed. T.M.

N82-17164# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
DAMAGE FROM HIGH EXPLOSIVE (HE) PROJECTILES
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 79-135 refs

Avail: NTIS HC A11/MF A01

The structural damage done by HE projectiles (20- to 30-mm, for example) is the result of multiple fragment penetrations and internal blast pressures, acting separately and in combination. The fragments are created as the metal casing surrounding the explosive bursts due to the intense pressures generated by the detonation. Fragment damage degrades structural strength and stiffness, and blast pressures added to the existing flight loads can cause excessive deformations and element failures. The nature and extent of structural damage from HE projectile fragments and blast pressure depend upon these variables: material type and thickness; projectile size and delay characteristics; striking velocity and obliquity; distance from detonation to impacted structure (standoff); and internal volume of structural cell and extent of venting. The significance of each of these variables is discussed. Qualitative descriptions of HE projectile damage in metallic and fiber composite structure are presented followed by a discussion of damage prediction analysis techniques for blast and fragments. T.M.

N82-17165# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
DAMAGE FROM ENGINE DEBRIS PROJECTILES
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 136-139

Avail: NTIS HC A11/MF A01

The effects of uncontained projectile emanating from an engine and subsequently striking an adjacent portion of the airframe are assessed. The effects are treated the same as for effects resulting from nonexploding military projectiles. There is an important distinction, however, in that the engine debris projectile is typically an irregular fragment (as opposed to a bullet), behaving more like a warhead fragment or the fragments generated from a high-explosive projectile. T.M.

N82-17166# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
HYDRODYNAMIC RAM DAMAGE
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 140-152

Avail: NTIS HC A11/MF A01

Hydrodynamic ram is a phenomenon that may cause extensive structural failure of aircraft fuel cells when they are subiected to ballistic impact. During impact and penetration of the fuel cell, intense pressure waves are generated within the liquid by the projectile. The response of the fuel cell to this pressure loading varies according to its construction. For example, the walls of an integral fuel cell are formed by the aicraft skin, which is usually constructed of high-strength metal designed to withstand normal flight loads. This type of structure can fail catastrophically in response to hydrodynamic ram pressure loading due to fracturing of the walls of the cell. Self-sealing fuel cells can also be defeated due to hydrodynamic ram by gross tearing of the material or by misalignment of the wound edges, thereby defeating the self-sealing process. Both of these effects become increasingly severe as fuel cells become smaller, or projectile kinetic energies increase. An analysis method to predict hydrodynamic ram pressures generated by small arms ammunition was developed. The analysis method is based on the conversion of projectile kinetic energy to pressure field energy and includes the effects of reflections from the tank walls. T.M.

N82-17167# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
EFFECTS OF CYCLIC LOADING ON PROJECTILE IMPACT DAMAGE
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 153-157

Avail: NTIS HC A11/MF A01

The cyclic loading induced during flight can influence the severity of existing impact damage by initiating fatigue cracks at the damage site, subsequent crack sharpening or blunting and crack growth. There can be significant time dependent changes in the residual strength of the structure due to these alterations in the size and character of the impact damage. Projectile produce a wide variety of damage types, including cracks, holes, tears, large determination, even totally severed structural elements. The response of the damaged structure when exposed to cyclic loads reflects this wide variety of structural damage. For example, the cyclic loading can result in immediate growth when the projectile damage is a crack. There may be, however, a time (number of cycles) devoted to crack nucleation. Several important aspects of the fatigue response of impact damaged structure are described in terms of crack initiation and extension. An approach which basically consists of assuming immediate fatigue crack initiation at the damage site, and then applying conventional crack growth analysis is suggested. T.M.

N82-17168# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
STIFFNESS DEGRADATION OF IMPACT DAMAGED STRUCTURE
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 159-160

Avail: NTIS HC A11/MF A01

Stiffness reduction in impact damaged structural elements can be important from two standpoints. The first is the alteration of load distribution within the structure, potentially causing overloading and failure of undamaged elements. The second area of potential concern is the residual stiffness of major structural components, since stiffness degradation may lead to instability and control inadequacy. These two topics are discussed, however, there are few verified analysis methods for predicting stiffness degradation associated with ballistic damage. Both of these stiffness degradation effects, but particularly the latter, become increasingly significant as the extent of the inflicted damage becomes larger. Stiffness degradation may well be a problem for HE projectile impacts, but it is generally insignificant with small arms. T.M.

N82-17169# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
STRENGTH DEGRADATION OF IMPACT DAMAGED STRUCTURE
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 161-194

Avail: NTIS HC A11/MF A01

Projectile damage destroys a portion of the load carrying capability of the structure, alters the distribution of internal loads, and introduces a flaw which may cause failure by locally disturbing the stress field. The latter effect is most significant with regard to the relatively small damage induced by small arms projectile and dispersed warhead or engine debris fragments. High explosive projectiles can often create damage of sufficient size to substantially degrade structural performance by all three effects. Estimating the residual strength of structure damaged by projectile impact is a major step in predicting structural capability. The analysis methods presented for evaluating strength capability are organized according to structural complexity: analysis of monolithic panels; analysis of multiple load path panels; and analysis of multielement structure. The application of conventional and modified fracture mechanics analysis to ballistic damaged panels is discussed. The extension of these approaches to the requirements of panels having discrete stiffening members are discussed. T.M.

N82-17170# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
ANALYSIS OF MULTIPLE LOAD PATH PANELS CONTAINING IMPACT DAMAGE
In its Design Manual for Impact Damage Tolerant Aircraft Struct. Oct. 1981 p 195-209

Avail: NTIS HC A11/MF A01

Many structural configurations cannot be represented as monolithic panels in assessing strength degradation from impact damage. The wings of transport aircraft, for example, often consist of skin with riveted stiffeners. The stiffeners can provide damage containment or crack assessment capability that is not considered in element residual strength analysis. Since the crack arrestment capability can significantly improve the residual strength of damaged structure, the stiffening must be included in the analysis. The response of stiffened panels to projectile damage, and available analytical techniques for residual strength prediction, are discussed. T.M.

CORROSION CONTROL TEST METHOD FOR AVIONIC COMPONENTS Final Report, 27 Sep. 1979 - 27 May 1981
A. W. Morris 25 Sep. 1981 60 p refs
(AD-A105061; NADC-81174-60) Avail: NTIS HC A04/MF A01 CSCL 01/3

The program objective was to develop an accelerated laboratory corrosion test capable of simulating the severe corrosive effects of an aircraft carrier deployment environment. The current standard 5% salt fog test is not severe enough to simulate the carrier environment, thus limiting its usefulness in forecasting corrosion failures. To provide test standards, representative electrical and electronic units were exposed on an oil burning carrier during a 9 month tropical cruise and on a nuclear carrier during a 10 month tropical cruise. A series of laboratory tests were run to identify corrosion environments which provide good correlation with actual carrier results. The tests were also judged on their ability to promote moisture related electrical failures. During the final phase of the program, 25 electronic and electrical components were exposed to the two most promising test methods. The selected test method is a modification of the NADC sulfur dioxide salt fog test. It utilizes a much higher exposure temperature and a dilute substitute ocean water solution for fog generation. In one week this test method produces both corrosion damage and electrial failures that correlate with the condition of the test articles exposed for nine to ten months on an aircraft carrier. DIGITAL AVIONICS INFORMATION SYSTEM (DAIS) DOCUMENTATION Final Report, Aug. 1979 - Jun. 1981
F. Forster and R. Gregory Wright-Patterson AFB, Ohio AFWAL Sep. 1981 97 p
(Contract F33615-79-C-1818; AF Proj. 2052)
(AD-A108000; AFWAL-TR-81-1162) Avail: NTIS HC A05/MF A01 CSCL 09/2

This report covers the work performed by SYSTRAN Corporation in providing Configuration control, technical editing and generation of documentation for the DAIS Program Branch. This effort encompassed the following functions: (1) maintaining the DAIS library, (2) generating certain specifications, plans, drawings and/or test reports, (3) performing configuration audits per MIL-STD-1521, (4) assuring that DAIS documents conformed to MIL-STD-490 and 483, (5) technical editing and configuration control over all DAIS documentation. The DAIS documentation effort was highly successful and could set an example for other R&D programs on how to properly document their efforts in MIL-STD format. Author (GRA)

FUNCTION SPECIFICATIONS FOR THE A-7E FUNCTION DRIVER MODULE Interim Report
P. C. Clements 27 Nov. 1981 177 p refs
(XF21242101)
(AD-A107922) Avail: NTIS HC A09/MF A01 CSCL 09/2

As part of the experimental redesign of the flight software for the Navy's A-7E aircraft, software modules were designed to encapsulate the characteristics of the behavioral requirements of the system. The purpose of these Function Driver modules is to allow the remainder of the software to remain unchanged when the required system behavior is modified without associated hardware changes. This document specifies the behavior of the system without regard to specific hardware devices. This report contains an explanation of the standard organization of each functional description, a description of the review procedures, specifications for all of the functional aspects of the A-7E software, and a set of indices and cross-references to help integrate this module with the rest of the system. As well as serving as development and maintenance documentation for the A-7E redesign, this document is intended to serve as a model for other people interested in applying our documentation and structuring techniques to other software projects. ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal*, vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. A82-18874 † **Soviet helicopter construction /2nd revised and enlarged edition/ (Sovetskoe vertoletostroenie /2nd revised and enlarged edition/).** A. M. Izakson. Moscow, Izdatel'stvo Mashinostroenie, 1981. 295 p. 61 refs. In Russian.

A brief history is presented of the development of helicopter construction in the Soviet Union. Following a review of the fundamental design characteristics of the basic classes of helicopters and of the major steps in the development of the Soviet helicopter industry, the prehistory of helicopter construction is traced from the designs of Leonardo da Vinci to Russian helicopter designs in the second half of the 19th century. The first stages in actual construction beginning with advances in aviation in the early 20th century are outlined, and the first Soviet helicopters to be built and operated successfully are presented, including the TsAGI 1-EA, 5-EA and 11-EA models. Attention is then given to the subsequent development of autogyros, true vertical lift helicopters, and present-day helicopters for various applications as exemplified by the Mi, Ka, and Yak series and foreign designs. An evaluation of the current status and future problems in helicopter design is also presented.

A.L.W.

A82-18893 **Transient two-dimensional temperature distributions in air-cooled turbine blades.** K. Gue, X. Ge, and X. Sun (China University of Science and Technology, Hefei, People's Republic of China). *Engineering Thermophysics in China,* vol. 1, July-Sept. 1980, p. 255-264. 10 refs. Translation.

The effect of using varying time increments is studied for finite element techniques for unsteady conduction problems, and a FORTRAN program for solving two-dimensional unsteady temperature field of air-cooled turbine blades is presented. The differential equation of two-dimensional unsteady conduction problems is defined with Robin's condition for inner and outer walls of the blade exchanging heat with the fluid by convection. After discretization into spatial triangular elements, three different discretizations of time are shown: a weighted-residual method, assuming the temperature distribution to be a linear time function, a weighted-residual method, assuming the temperature to be a quadratic time function between each step, and a technique treating the difference quotient of temperature to time as a linear function of time. The highest temperature of the blade was found to occur at the trailing edge and the burning-gas side, using the third time discretization method.

A82-18894 **Impingement cooling of concave surfaces of turbine airfoils.** J. Cheng and B. Wang (Nanjing Aeronautical Engineering College, Nanjing, People's Republic of China). *Engineering Thermophysics in China,* vol. 1, July-Sept. 1980, p. 275-291. 12 refs. Translation.

Experimental results of impingement cooling of two aluminum specimens of different sizes with three impingement tubes are presented in this paper. The specimens, simulating the leading edge of a turbine blade, were preheated and cooled by jets from different impingement tubes at various flow rates and distances. The lumped capacity method was used to determine the cooling rate of the aluminum specimen. The mean heat transfer coefficients were calculated and correlated with dimensionless parameters. The results of the Nusselt numbers obtained from experiments were consistent with those calculated from the recommended formula. Furthermore, these results were compared with the correlations of Metzger and those of Ravuni and Tabakoff, and it was concluded that the formula proposed by this paper was more reasonable. (Author)

A82-18898 † **The city and aviation (Gorod i aviatsiia).** A. I. Borodach, B. N. Mel'nikov, V. I. Chernikov, and B. I. Berdnik. Moscow, Stroiizdat, 1980. 184 p. 22 refs. In Russian.

Basic information is presented on various types of air transportation facilities that serve cities: airports for conventional aircraft and for STOL and V/STOL aircraft, helicopter stations, and railroad stations connecting the city with the airports. Attention is given to requirements concerning the location of airports in relation to cities; problems of convenient access, noise reduction, and flight safety are considered. The basic principles of the organization of transportation between cities and airports are examined. B.J.

A82-18899 † **Accidents of surface effect ships and hydrofoil craft (Avarii sudov na vozdushnoi podushke i podvodnykh kryl'iakh).** I. M. Korotkin. Leningrad, Izdatel'stvo Sudostroenie, 1981. 216 p. 79 refs. In Russian.

The work describes 200 accidents and disasters of hovercraft and hydrofoil craft of the United States, Great Britain, France, and other fleets which occurred in the 1960s and 1970s as a result of capsizing, storm damage, collisions, fires, explosions, etc. The causes of the accidents, the functioning of various craft systems, and the actions of the crews are examined. Recommendations on the prevention of such accidents are discussed. B.J.

A82-18903 # **Tactical Radar Threat Generator system.** W. T. Harpster and J. L. Gebhart (Emerson Electric Co., St. Louis, MO). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 43-53.

It is pointed out that a military force's survival, and the successful accomplishment of its objective is highly dependent on preconflict training. The success of military training is, in turn, dependent on the accuracy with which the combat environment is duplicated. The combat environment for the crew of an attack aircraft is examined. Realistic training of combat pilots cannot be accomplished unless a typical threat environment is simulated in the target area. A cost effective approach to training involves the procurement of threat emitter equipment which meets certain minimum requirements for effective aircrew training. A suitably low-cost threat simulator is the Tactical Radar Threat Generator (TRTG). The U.S. Army version has become known as 'GRETA' an acronym for Ground Radar Emitter for Training Aviators. Attention is given to TRTG hardware, the digital scan converter, and the scoring equipment. G.R.

A82-18904 # **Design criteria for a miss distance radar.** L. I. Ruffe (Racal-MESL, Ltd., Linlithgow, Scotland). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 54-60. Research supported by the Ministry of Defence (Procurement Executive).

When a missile, fired in connection with development trials or operator training, misses the target, it is most desirable to know by how much it has missed. This miss-distance must be measured dynamics are described by the clamped-free modes. A blade dynamic stiffness matrix of order 4 + 10l, (where l is the number of lacing wires), is formed directly from the blade modal data in the interface displacements between the disk and the blades and between the blades and the lacing wires. The lacing-wires are treated as elastic and massless. The sign-count method and bisection are used to locate the eigenvalues. The method presents no numerical difficulties and is automatic as well as efficient. J.F.

A82-19340 # **On the formulation of coupled/uncoupled dynamics analyses of blade-disc assemblies.** P. S. Kuo (Avco Corp., Avco Lycoming Stratford Div., Stratford, CT). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-126.* 9 p. 6 refs. Members, $2.00; nonmembers, $4.00.

The interaction between the blades and their attachments on a flexible rotor-disc assembly may induce potential vibration problems. Coupled blade-disc resonance, the dissimilar behavior of blade groups, and the uncoupled blade or disc natural frequencies must be evaluated. To satisfy all of the requirements and at the same time reduce the complexity of the analysis, an efficient analytical formulation of a combined blade-disc segment model using finite element rotational symmetry techniques was developed. The capability of the technique, as demonstrated, using a plate-element model, includes computer plots of the blade and disc normalized modal deformations in consecutive segments at the respective natural frequencies. The results are discussed and verified by fundamental vibration theory. Various finite element models of blades and discs are also presented to clarify the modeling procedure. The method is shown to be a cost-effective tool that readily lends itself to daily routine use. (Author)

A82-19342 # **Optimal shape design of turbine blades.** J. P. Queau and P. Trompette (Lyon, Institut National des Sciences Appliquées, Villeurbanne, Rhône, France). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-128.* 6 p. 10 refs. Members, $2.00; nonmembers, $4.00.

This paper attempts to present a general engineering method for minimizing the weight of rotating turbine blades in optimizing the cross section shapes. The constraints originate from either aerodynamic or solid mechanic specifications. As the problem is reformated after a first F.E. analysis the optimization process is quite inexpensive. A large variety of compressor or turbine rotating blades can be designed by this method which uses the variables selected by the aerodynamicists and leads to continuous optimal profiles. (Author)

A82-19343 # **Investigation of vibration of shrouded turbine blades.** J. Wachter and H. Wolfs (Stuttgart, Universität, Stuttgart, West Germany). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-129.* 5 p. 6 refs. Members, $2.00; nonmembers, $4.00.

The grouping of cantilever blades by means of shrouding (bands, plates or damping wires) results in a new vibratory system the theoretical and experimental analysis of which would pose a variety of problems. In order to find some improved approach of numeric predictive computation we must carry out experimental analyses while varying systematically some of the influencing parameters. This paper discusses some static parameter analyses of model blades of simplified geometry. The results obtained are compared with numeric calculations by the finite elements method. (Author)

A82-19344 # **A practical approach to systems mode analysis.** P. W. Spence (General Electric Co., Aircraft Engine Group, Lynn, MA). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-130.* 8 p. 5 refs. Members, $2.00; nonmembers, $4.00.

A simplified methodology is presented for the analysis of disc-blade-shroud assemblies to obtain system mode frequencies and stress and load distributions in the blades. The method uses the cantilever vibration characteristics of the blades with a travelling wave solution applied to the shroud boundary conditions. Theoretical and experimental results are compared and some design criteria are indicated for frequency tuning to meet design objectives. (Author)

A82-19347 # **An investigation of dual mode phenomena in a mistuned bladed-disk.** W. Q. Stange and J. C. MacBain (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-133.* 12 p. 5 refs. Members, $2.00; nonmembers, $4.00.

This paper presents the results of an investigation addressing the effects of mistuning on the lower modes of vibration of a simple bladed-disk model. The phenomena of dual modes, also known as mode splitting, is studied using holographic interferometry and strain gage measurements under nonrotating and rotating conditions. Resonant amplitudes, mode shapes, and natural frequencies of the disk model were determined, without deliberately mistuning the disk. The tests were then repeated with the disk deliberately mistuned to varying degrees, paying particular attention to the second diameter (2N) dual modes. Additionally, tests were conducted on the disk at a rotational speed of 2000 rpm, in an effort to gain insight as to the vibratory characteristics of the disk under rotating conditions. (Author)

A82-19348 # **Measurement of the influence of flow distortions on the blade vibration amplitude in an air turbine.** J. Beckmann and J. Wachter (Stuttgart, Universität, Stuttgart, West Germany). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-135.* 9 p. 6 refs. Members, $2.00; nonmembers, $4.00.

Experimental investigations in an air turbine are carried out to determine the influence of exciting forces due to flow distortions on the vibration amplitudes of a rotating bladed disk. Flow distortions are simulated at different operating points by changing the outlet angle of the guide vanes. The dynamic signals like blade vibrations and fluctuating pressures are measured, transmitted by a five channel telemetry system, stored on a multitrack tape and subsequently analyzed by a real-time analyzer and a computer comparing amplitude and phase shift. (Author)

A82-19349 # **A parametric study of dynamic response of a discrete model of turbomachinery bladed disk.** A. Muszynska (Dayton, University, Dayton, OH) and D. I. G. Jones (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-137.* 12 p. 8 refs. Members, $2.00; nonmembers, $4.00.

A model consisting of n five-degree-of-freedom subsystems has been developed to characterize some of the mechanical response features of a bladed disk system, including four modes of each blade, n bending modes of the disk, blade-to-blade and blade-to-ground Coulomb friction, structural damping, blade-to-blade mistuning, and various types of excitation. The equations of motion and method of solution are described, and numerical results illustrate some of the interesting effects of various levels of frictional damping on tuned and mistuned systems, which may shed light on some aspects of damped system design and performance. (Author)

A82-19351 # **Application of structural optimization technique to reduce the external vibrations of a gas-turbine engine.** H. Bedrossian and R. Phoenix (Avco Corp., Avco Lycoming Stratford Div., Stratford, CT). *American Society of Mechanical Engineers, Design Engineering Technical Conference, Hartford, CT, Sept. 20-23, 1981, Paper 81-DET-143.* 8 p. Members, $2.00; nonmembers, $4.00.

The development of a structural and dynamics finite element model of a complete gas-turbine engine was achieved using the resources of the Integrated Turbine Analysis System, an in-house research program. This system employed interactive graphics and an engineering database to generate a NASTRAN dynamic model of the subject engine. A normal modes analysis identified the natural frequencies and associated mode shapes for the engine structure within its operating range. A forced-response analysis due to the steady-state sinusoidal load of rotor unbalanced was obtained. Results were found to be in good agreement with typical vibration records obtained in a production test cell. The forced response strain energy method was utilized to identify the structural elements primarily contributing to the response. The effect of component stiffness on engine vibration levels and the recommended design modification to reduce these levels, was established. (Author)

A82-19521 # **Analysis and tolerance study of an array antenna for a new generation of secondary radars.** M. Di Fausto, A. Saitto (Selenia S.p.A., Rome, Italy), and G. Pelosi (Roma, Università, Rome, Italy). In: European Microwave Conference, 10th, Warsaw, Poland, September 8-12, 1980, Proceedings. Sevenoaks, .Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 144-148. 11 refs.

An open array antenna is analyzed considering performance and tolerances with respect to the specifications given by Eurocontrol and FAA. Computed results and parametric charts are presented. The analytical methods used are briefly described. Some considerations on the choice of the radiating element (slot or dipole) are given with respect to the desired performance. (Author)

A82-19552 # **Leaky wave antenna using an inverted strip dielectric waveguide.** R. Crampagne, L. Padellec, and A. Sarremejean (ONERA, Centre d'Etudes et de Recherches de Toulouse, Toulouse, France). In: European Microwave Conference, 10th, Warsaw, Poland, September 8-12, 1980, Proceedings. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 474-479. 5 refs.

Experimental results on a leaky wave antenna built from an inverted strip dielectric waveguide are presented, the frequency ranging from 64 to 74 GHz. The frequency scanning for beams inclined backward is investigated, along with the variations of gain and 3 dB beamwidth. An approximate analysis is proposed for calculating the main lobe angle and the radiating space harmonic's amplitude. Comparison between experimental and theoretical results shows that the angle's value (for inclined beams) is very sensitive to machining tolerance. Several approximate theoretical methods are proposed for determining the main lobe angle. C.R.

A82-19621 **Trends in aviation fuels and lubricants; Proceedings of the West Coast International Meeting, Seattle, WA, August 3-6, 1981.** Meeting sponsored by the Society of Automotive Engineers. Warrendale, PA, Society of Automotive Engineers, Inc. (SAE Proceedings SP-492), 1981. 65 p. $9.00.

Trends in aviation fuels and lubricants are reviewed in a historical aspect and with reference to recent measurements which can provide projections for anticipated trends in the near future. Topics discussed include a short history of aviation gasoline development covering the period 1903-1980; a history of aircraft piston engine lubricants; aviation turbine fuel properties and their trends; and finally, the history of aviation turbine lubricants. V.L.

A82-19622 **A history of aircraft piston engine lubricants.** R. V. Kerley. In: Trends in aviation fuels and lubricants; Proceedings of the West Coast International Meeting, Seattle, WA, August 3-6, 1981. Warrendale, Pa, Society of Automotive Engineers, Inc., 1981, p. 15-42. 50 refs.

This paper is a review of the literature covering the history of the use of lubricants. The uses of oils derived from animals, vegetables and minerals are placed in perspective from ancient times to the Wright Brothers' flight in 1903. After that period, the discussion is confined largely to the lubrication of aircraft piston engines. The paper attempts to explain the preference for castor oil in European and British engines and the more general, but by no means exclusive, use of petroleum-based mineral oils in the United States. The background for the continued, and often controversial use of straight mineral oil, some of the additives used, tests of synthetic oil in winter use, and oil reclamation are reviewed through World War II until 1963 when lubricating oils containing ashless additives became the predominant products. (Author)

A82-19623 * **Aviation turbine fuel properties and their trends.** R. Friedman (NASA, Lewis Research Center, Cleveland, OH). In: Trends in aviation fuels and lubricants; Proceedings of the West Coast International Meeting, Seattle, WA, August 3-6, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 43-54. 16 refs.

This paper is an examination of published Jet A inspection data covering selected property distributions, averages, and trends for the period from 1969 to 1979. Yearly median values of aromatics, mercaptan sulfur content, 10-percent distillation temperature, smoke point, and freezing point are changing with time, approaching their specification limit values, particularly in the last three years. A near-specification property is defined as one within a stated tolerance band around the specification limit. On this basis, most fuel samples have one to three near-specification properties, the most common being aromatics, smoke point, and freezing point. (Author)

A82-19624 **The history of aviation turbine lubricants.** R. Knipple and J. Thich (Royal Lubricants Co., Inc., East Hanover, NJ). In: Trends in aviation fuels and lubricants; Proceedings of the West Coast International Meeting, Seattle, WA, August 3-6, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 55-63. 24 refs.

Condensed in this report are the salient points of the forty year history of the development of the gas turbine engine, its associated aircraft and the various lubricants used. Tables are included comparing some of the important specification properties of many of these fluids, both petroleum and synthetics. An explanation is incorporated outlining the reasons synthetics perform well in the turbine engine environment. A genealogical chart detailing the various dates on which lubricant specifications or important changes were issued is provided. There are indications that some commercially available lubricants are being stressed to the limits of the fluids capabilities. Any new engine designs, therefore, may require entirely new lubricants and/or new lubrication systems. (Author)

A82-19649 # **The significance of electronics for air traffic control at the present time and in the future (Die Bedeutung der Elektronik für die Flugsicherung in Gegenwart und Zukunft).** K. Platz (Bundesanstalt für Flugsicherung, Frankfurt am Main, West Germany). *Luft- und Raumfahrt,* vol. 2, 4th Quarter, 1981, p. 109-112, 114-116. In German.

It is pointed out that the current Air Traffic Control (ATC) system is the result of an evolutionary development process, taking place during the last thirty years. The ATC system can perform its tasks only by making use of the advances made in the area of electronics. The system aids provided for the air traffic controller must be continuously improved in connection with the adaptation of ATC to aircraft-related technological advances. Improved ACT procedures make it also possible to enhance the control capacity of the system in response to increases in the volume of air traffic. Attention is given to the technical system of ATC, future developments on the international level, and technological possibilities for future ATC systems. The use of an onboard computer is considered along with traffic flow control, a European flight-plan data bank, the telecommunication network for aviation, an enlarged radar system, data transmission, new data-display methods, and the cost of ATC. G.R.

A82-19733 # **Technical evaluation report of the AGARD Fluid Dynamics Panel Symposium on computation of viscous-inviscid interactions (Rapport d'evaluation technique du Symposium organisé par la Commission de Dynamique des Fluides de l'AGARD sur le calcul de l'interaction fluide-parfait-fluide visqueux).** J. C. Le Balleur (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Association Aéronautique et Astronomique de France, Colloque d'Aérodynamique Appliquée, 18th, Poitiers, France, Nov. 18-20, 1981.) ONERA, TP* no. 1981-116, 1981. 9 p. 31 refs. In French.

The symposium surveys the status of current research in computational aerodynamics based on methods solving a viscous-inviscid interaction problem. In spite of limitation in the models or numerical techniques for shock wave boundary layer interaction or trailing edge problems, the situation is well advanced in unseparated, steady two-dimensional flow, with the potential approximation for the inviscid part. Progress has advanced in the computation of separations, based on strong interaction models. It would be fruitful to make use of the complete Euler equations in transonic flow. Progress toward strong interaction methods is much less advanced in unsteady or three-dimensional flow, but seems likely. The development of strong interaction methods, highly connected with that of inviscid and Navier-Stokes numerical techniques, appears as mandatory to having access to practical application needs. (Author)

A82-19737 # **A progress report on the European Transonic Wind Tunnel Project (Le Projet de Soufflerie Transsonique euro-**

radio navigation system that will provide extremely accurate three-dimensional position fixes and timing information to properly equipped users anywhere on or near the earth. Civil applications of GPS are mostly limited to either air or marine navigation. In 1977, an investigation was initiated with the objective to prove the feasibility of land navigation with a low cost, single channel, single frequency GPS receiver based on the C/A code only. A GPS receiver was built and static and dynamic tests were conducted. An accuracy of 20 meters was obtained. It was found that the low-cost navigation algorithms used provide adequate and acceptable performance for land navigation. The receiver performance has been excellent even under the adverse environments, such as downtown San Francisco and San Francisco International Airport. G.R.

A82-20672 **The influence of technology advances on integrated CNI avionics.** R. A. Reilly and C. R. Ward (ITT, ITT Avionics Div., Nutley, NJ). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 61.3.1-61.3.6.

Attention is given to an integrated communication, navigation, and identification avionics (ICNIA) architecture which represents an attempt to overcome current-day tactical avionics problems in a highly cost effective manner. This architecture uses a wideband, agile, programmable transversal filter, as a key element of the design. The use of such a device as a preselector filter reduces the input bandwidth from approximately 400 MHz to 5 MHz, which is the spectrum bandwidth of a Joint Tactical Information Distribution System (JTIDS) pulse. Under digital control, the filter is capable of switching tuning frequencies in less than six nanoseconds. This rapid tuning feature makes it possible for a single filter to scan all of a selected set of frequencies in the L-band region within the total delay time of the tapped delay line in the transversal filter. Expected benefits of ICNIA are related to gains with respect to size, weight, cost, as well as performance. G.R.

A82-20684 **Relay-augmented data links in an interference environment.** C. E. Cook (Mitre Corp., Bedford, MA). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 3. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 63.6.1-63.6.5. Contract No. F19628-79-C-0001.

Use of communications relays is examined as a means of improving the operation of line-of-sight links in an interference environment. Expressions are derived that define optimum relay locations and number of relays. The relationships are functions of system and interference parameters, such as effective radiated power (EFP) ratios and processing gain, as well as of distances from the source transmitter and destination receiver to the noise source position. Bounds on flight path orbits of airborne relays are derived. Results obtained can be applied to the analysis of trade-offs among the various design factors when communications links are subject to interference. This can include the assessment of fixed constraints, such as the number of relays, upper limits on ERP and processing gain, or lower limits on data rate. An example is presented that illustrates the effectiveness of a relay in creating a communications corridor in the presence of multiple interference sources. (Author)

A82-20695 **An analysis of antijam communication requirements in fading media.** J. D. Oetting and A. E. Durling (Booz, Allen and Hamilton, Inc., Bethesda, MD). In: NTC '80; National Telecommunications Conference, Houston, TX, November 30-December 4, 1980, Conference Record. Volume 4. New York, Institute of Electrical and Electronics Engineers, Inc., 1980, p. 69.3.1-69.3.5. 6 refs.

The paper discusses the effects of jamming in a multipath propagation environment in which both the desired signal and the jamming signal are subject to Rice or Rayleigh fading. The distribution of the ratio of two independent Rician random variables is calculated, and this result is related to the evaluation of the required processing gain for the case of air-to-air or air-to-ground communication in a hostile electronic environment. An example of a specific jamming scenario is employed to illustrate how these results can be used to estimate the required processing gain of an airborne UHF AJ communication system. (Author)

A82-20728 # **Padé approximation applied to flow past thin airfoils.** S. N. Venkatarangan and G. Narendran (Indian Institute of Technology, Madras, India). *Journal of Mathematical and Physical Sciences*, vol. 14, Oct. 1980, p. 485-489.

Padé approximations derived from nonuniform solutions of flows around elliptic and Joukowski airfoils are examined. Off-diagonal Padé approximants are chosen for the flow past elliptic airfoils and poles are obtained. A perturbation expansion is defined for flow past a Joukowski type airfoil, and nondiagonal Padé approximants are used to accommodate the stagnation point at the leading edge. Comparisons of the values obtained are made with values obtained by the Lighthill method. M.S.K.

A82-20742 * # **Improved plasma sprayed MCrAlY coatings for aircraft gas turbine applications.** F. J. Pennisi and D. K. Gupta (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). *American Vacuum Society, International Conference for Metallurgical Coatings, San Francisco, CA, Apr. 6-10, 1981, Paper.* 17 p. 11 refs. Contract No. NAS3-21730.

Eighteen plasma sprayed coating systems, nine based on the NiCoCrAlY chemistry and nine based on the CoCrAlY composition, were evaluated to identify coating systems which will provide equivalent or superior life to that shown by the electron beam physical vapor deposited NiCoCrAlY and CoCrAlY coatings respectively. NiCoCrAlY-type coatings were examined on a single crystal alloy and the CoCrAlY based coatings were optimized on the B1900 + Hf alloy. Cyclic burner rig oxidation and hot corrosion and tensile ductility tests were used to evaluate the various coating candidates. For the single crystal alloy, a low pressure chamber plasma sprayed NiCoCrAlY + Si coating exhibited a 2X oxidation life improvement at 1121 C (2050 F) over the vapor deposited NiCoCrAlY material while showing equivalent tensile ductility. A silicon modified low pressure chamber plasma sprayed CoCrAlY coating was found to be more durable than the baseline vapor deposited CoCrAlY coating on the B1900 + Hf alloy. (Author)

A82-20743 * # **Power system design optimization using Lagrange multiplier techniques.** Y. Yu (Xerox Corp., El Segundo, CA) and F. C. Lee (Virginia Polytechnic Institute and State University, Blacksburg, VA). *Power Conversion International Conference, Munich, West Germany, Sept. 14, 1981, Paper.* 18 p. 8 refs. Contract No. NAS3-21051.

An optimization technique using the Lagrange Multiplier Method is proposed to facilitate design of switching power converter systems. The essence of the optimization is to identify the optimal battery voltage level and switching frequency along with the detailed converter design so that the total system weight including the battery and the packaged converter is minimized, and concurrently all specified power circuit performances are satisfied. (Author)

A82-20751 **Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980.** Symposium sponsored by the Society of Flight Test Engineers. Lancaster, CA, Society of Flight Test Engineers, 1980. 451 p.

Flight testing procedures were discussed in terms of F-18 carrier suitability testing, the suitability of using JP-8 fuel for U.S. combat aircraft assigned to NATO forces, and icing test programs for the F-16 and for helicopters. Methods of instrumenting a test airplane were examined, as well as the development of a self-contained flight test data acquisition system. Attention was given to fuel conservation data bases for general aviation aircraft, to flight testing the airborne cruise missile, and testing the Jetwing STOL research aircraft. Tests of the Tornado advanced avionics system were described, as were tests of a jet-powered sailplane, flight tests of effect, and flyover noise level tests. Finally, size reduction of flight test instrumentation and simulator data test instrumentation were considered, and data processing for flight tests and real-time telemetry were reviewed. M.S.K.

A82-20752 **Initial F-18 carrier suitability testing.** J. W. Hakanson (McDonnell Douglas Corp., Patuxent River, MD). In:

Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980.
Lancaster, CA, Society of Flight Test Engineers, 1980, p. 1-1 to 1-14.

Sea Trials results are reported for carrier basing of the F-18 Hornet, and the instrumentation characteristics are described. Complete ground tests, simulations, and drop tests were performed before the carrier tests, and catapult launches were immediately successful. EMC, deck handling/operation, instrumentation, and data system tests are outlined, noting that real-time data was transmitted to the manufacturer. Thirty-two catapults and 32 arrested landings were completed onboard a carrier, with little pilot compensation for burble and no unintentional bolters. Further trials established startability with the APU, engine crossbleed, and the low and high pressure huffer, use of six different catapults, compatability with shipboard operations, and the need for a fix of the lower nose wheel spin-up speed to alleviate loads on the repeatable release holdback springs. M.S.K.

A82-20753 **F-16 ground and inflight icing testing.** C. M. Core, Jr. (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 3-1 to 3-35. 13 refs.

The discovery of icing problems in the F-16 variable inlet vanes, the fixes and the tests necessary to correct the problem, and the design of further tests to assure that military anti-icing specifications are met are discussed. The icing problem was detected during the AF qualifications programs when a second stage glime ice test flown within an ice cloud produced from a tanker aircraft caused damage in nine stages of the fan blades. Subsequent decisions were made to heat the airframe inlet strut, retrofit a three position anti-ice switch into existing F-16s, and improve the icing test procedures and in particular the quality of the ice. Further icing observed in an operational status led to a test program to investigate the effectiveness of electrically heating the inlet strut and moving the anti-ice sensor probe forward. Suggestions are offered for more accurate military specifications for defining ice and ice survival conditions. M.S.K.

A82-20754 **Helicopter icing spray system.** D. Belte (U.S. Army, Aviation Engineering Flight Activity, Edwards AFB, CA). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980.
Lancaster, CA, Society of Flight Test Engineers, 1980, p. 4-1 to 4-18. 8 refs.

The U.S. Army has used a CH-47C as an airborne spray tanker since 1973 for helicopter qualification testing in icing conditions. The initial icing cloud it produced was found to consist of much larger diameter drops than natural clouds, and problems existed in uniformity and control of its liquid water content. A program was undertaken in 1979 to modify the system to generate a spray plume more closely resembling a natural cloud. This effort included ground and icing wind tunnel evaluation of spray atomizers, a flight survey of turbulence behind the spray aircraft, and in-flight evaluation of atomizer spray characteristics. Modifications were incorporated, and the new system was used for icing tests in 1980. Evaluation of the new spray cloud characteristics shows a vastly improved drop size distribution and a more homogeneous liquid water content, closely resembling that of a natural cloud. (Author)

A82-20755 **JP-8 fuel conversion evaluation.** R. A. Stambovsky (USAF, Flight Test Center, Edwards AFB, CA). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 6-1 to 6-32. 26 refs.

The test results of determining the operability of the OV-10A, F-5, and A-37B aircraft on both JP-4 and JP-8 fuel to assure compatibility with NATO fuels are reported. Air starts, throttle transients, low temperature tests, thrust stand tests, weight and balance, and smoke evaluations were performed, using on and off trim conditions. Technical specifications were developed for the airstart envelope, preheating procedures, and fuel control gravity settings when using the NATO F-34 (JP-8) fuel. JP-8 is a kerosene type fuel with a higher specific gravity and flash point than JP-4 fuel, leading to safer handling but a greater weight penalty and more limited airstart features. Low temperature starts were within the manual described limits, as were throttle techniqes and center-of-gravity shifts. M.S.K.

A82-20756 * **Development of a simple, self-contained flight test data acquisition system.** R. R. L. Renz, R. Clarke, and J. Roskam (Kansas, University, Lawrence, KS). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 8-1 to 8-22. 16 refs. NASA-supported research.

The system concepts and the flight test program results for a NASA designed in-flight data acquisition system are described. The system draws power from a rechargeable battery pack and intrudes on the aircraft systems only with a total pressure probe, a static pressure probe, and control position transducers, which are simply taped to the frame. A 4000 byte microcomputer forms the heart of the data recording system for cassette tape storage, and is expansion coupled to an eight-bit interactive microcomputer which interfaces with a transducer package for 16-channel demultiplexing. The transducers, ranges, and accuracies are listed, and a five/sec data acquisition rate minimum requirement is noted, although a 10/sec rate is used. The system components are detailed, along with the control and data processing procedures, and the results of dynamic flight testing are presented. M.S.K.

A82-20757 **General aviation fuel conservation in the 1980's.** G. R. Bromley (Beech Aircraft Corp., Wichita, KS). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980.
Lancaster, CA, Society of Flight Test Engineers, 1980, p. 9-1 to 9-22.

Techniques for conserving fuel in-flight are given from a flight engineer's point-of-view, noting that aircraft designs will increasingly incorporate cleaner aerodynamics and better engine-to-airframe matching. The effects of wind and temperature at various altitudes and fuel consumption in ascent and descent are considered, and methods for determining maximum range airspeeds are developed, particularly for choosing long-range cruise airspeeds. Specific charts are presented for private pilots in general aviation aircraft, relating wind, no-wind, and tailwind conditions as regards to fuel consumption. M.S.K.

A82-20759 * **Determining performance parameters of general aviation aircraft.** G. Bull and P. D. Bridges (Mississippi State University, Mississippi State, MS). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 12-1 to 12-16. 6 refs. Grant No. NAG1-3.

A method for determining propeller efficiency and drag from flight tests, using relatively simple instrumentation, is under development at Mississippi State University. Flight test data from several simple maneuvers are combined to produce sufficient information to determine the desired parameters. Information obtained from the transient response of airspeed to a step change in power or drag in level flight is utilized. Theory is developed and results of preliminary computer studies and preliminary flight test are presented. (Author)

A82-20760 **Tornado-avionic development testing.** E. K. Obermeier (Messerschmitt-Bölkow-Blohm GmbH, Manching, West Germany). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 13-1 to 13-17.

The developmental testing of navigation and terrain following subsystem of the avionics system in the Tornado all-weather combat aircraft are described. Navigation data supplied by inertial navigation, Doppler radar, SAHR, ADC, and sensor data are fed to the main computer through a Kalman filter. The system is hierarchical and reverts to successively lower navigation modes in case of damage to the primary equipment. Quantified flight tests were made during 100 nm flights around the terrain near the air base and the radar tracking

US-Patent-Class-73-178R) Avail: US Patent and Trademark Office CSCL 01D

A display device is disclosed which is particularly suited for providing the pilot of an aircraft with combined inflight altitude, heading, altitude, and horizontal situation information previously available only by using two or three devices providing separate displays. The preferred embodiment combines a commonly used and commercially available flight director-type device for providing a display in combination with a miniature aircraft supported for angular displacement from a vertical orientation to indicate heading error, or heading offset, and an extended course deviation indicator bar which projects into juxtaposition with the miniature aircraft for providing a true picture of the aircraft's horizontal situation relative to a selective VOR, ILS, or MLS course.

THREAT PERCEPTION WHILE VIEWING SINGLE INTRUDER CONFLICTS ON A COCKPIT DISPLAY OF TRAFFIC INFORMATION

Stephen R. Ellis and Everett Palmer Jan. 1982 17 p refs
(NASA-TM-81341; A-8798) Avail: NTIS HC A02/MF A01 CSCL 01D

Subjective estimates of the threat posed by a single intruder aircraft were determined by showing pilots photographs of a cockpit display of traffic information. The time the intruder was away from the point of minimum separation was found to be the major determinant of the perception of threat. When asked to choose a maneuver to reduce the conflict, pilots selected maneuvers with a bias toward those that would have kept the intruders in sight had they been visible out the cockpit window.

AIRCRAFT ALERTING SYSTEMS STANDARDIZATION STUDY. VOLUME 2: AIRCRAFT ALERTING SYSTEM DESIGN GUIDELINES Final Report

B. L. Berson, D. A. Po-Chedley, G. P. Boucek, D. C. Hanson, M. F. Leffler, and R. L. Wasson Jan. 1981 186 p refs
(Contract DOT-FA79WA-4266)
(AD-A106732; D6-49976TN; FAA-RD-81-38-vol-2) Avail: NTIS HC A09/MF A01 CSCL 01/4

This report is one of a series of documented studies directed to the improvement and standardization of aircraft alerting systems. The purpose of the study was to develop and validate, through simulation, functional design criteria that can be used in designing effective aircraft alerting systems. The major objectives of this phase of the study were to: resolve system component questions; validate the two candidate system/concepts by comparison to a representative baseline system, for both the pilot and flight engineer stations; evaluate presentation media and display formats for time-critical warnings; and develop guidelines for the design of alerting systems. This document presents a set of design guidelines directed to the improvement and standardization of aircraft alerting systems. The objective of the guidelines is not to define a simple hardware design that each manufacturer must use, but rather to provide functional design criteria that can be used to develop effective alerting systems, and to promote standardization within the industry.

DIGITAL AVIONICS INFORMATION SYSTEM (DAIS): DEVELOPMENT AND DEMONSTRATION Final Report, 1 Oct. 1978 - 31 Jul. 1981

M. J. Cook, R. C. Mason, J. L. Stautberg, L. E. Self, R. L. Ellison, and M. J. Strathman Wright-Patterson AFB, Ohio AFWAL Sep. 1981 201 p
(Contract F33615-78-C-1502; AF Proj. 2052)
(AD-A107906; AFWAL-TR-81-1165) Avail: NTIS HC A10/MF A01 CSCL 09/2

The Digital Avionics Information System (DAIS) represents a significant advance in the technology of avionics system architecture. DAIS is a total systems concept, exploiting standardization, modularity, and application independent executive software to provide a system architecture adaptable to many aircraft, missions, and avionics configurations and fully capable of accommodating new advances in technology. These fundamental system characteristics are described in this report, the specific system features which provide these characteristics and attributes are presented.

RESEARCH AND DEVELOPMENT PROGRAM FOR NON-LINEAR STRUCTURAL MODELING WITH ADVANCED TIME-TEMPERATURE DEPENDENT CONSTITUTIVE RELATIONSHIPS Final Report

Kevin P. Walker 25 Nov. 1981 187 p refs
(Contract NAS3-22055)
(NASA-CR-165533; PWA-5700-50) Avail: NTIS HC A09/MF A01 CSCL 21E

Results of a 20-month research and development program for nonlinear structural modeling with advanced time-temperature constitutive relationships are reported. The program included: (1) the evaluation of a number of viscoplastic constitutive models in the published literature; (2) incorporation of three of the most appropriate constitutive models into the MARC nonlinear finite element program; (3) calibration of the three constitutive models against experimental data using Hastelloy-X material; and (4) application of the most appropriate constitutive model to a three dimensional finite element analysis of a cylindrical combustor liner louver test specimen to establish the capability of the viscoplastic model to predict component structural response.

STUDY OF CONTROLLED DIFFUSION STATOR BLADING. 1. AERODYNAMIC AND MECHANICAL DESIGN REPORT

E. Canal, B. C. Chisholm, D. Lee, and D. A. Spear Jan. 1981 97 p refs
(Contract NAS3-22008)
(NASA-CR-165500; PWA-5698-28) Avail: NTIS HC A05/MF A01 CSCL 21E

Pratt & Whitney Aircraft is conducting a test program for NASA in order to demonstrate that a controlled-diffusion stator provides low losses at high loadings and Mach numbers. The technology has shown great promise in wind tunnel tests. Details of the design of the controlled diffusion stator vanes and the multiple-circular-arc rotor blades are presented. The stage, including stator and rotor, was designed to be suitable for the first-stage of an advanced multistage, high-pressure compressor.

COMPARISON OF ACOUSTIC DATA FROM A 102 MM CONIC NOZZLE AS MEASURED IN THE RAE 24-FOOT WIND TUNNEL AND THE NASA AMES 40- BY 80-FOOT WIND TUNNEL

A. Atencio, Jr. and J. McKie (Royal Aircraft Establishment, England) Jan. 1982 23 p refs
(NASA-TM-81343; A-8801) Avail: NTIS HC A02/MF A01 CSCL 21E

A cooperative program between the Royal Aircraft Establishment (RAE), England, and the NASA Ames Research Center was initiated to compare acoustic measurements made in the RAE 24-foot wind tunnel and in the Ames 40- by 80-foot wind tunnel. The acoustic measurements were made in both facilities using the same 102 mm conical nozzle supplied by the RAE. The nozzle was tested by each organization using its respective jet test rig. The mounting hardware and nozzle exit conditions were matched as closely as possible. The data from each wind tunnel were independently analyzed by the respective organization. The results from these tests show good agreement. In both facilities, interference with acoustic measurement is evident at angles in the forward quadrant.

BRITTLE MATERIALS DESIGN, HIGH TEMPERATURE GAS TURBINE Final Report, 1 Jul. 1971 - 31 Aug. 1979
Arthur F. McLean and Eugene A. Fisher Mar. 1981 232 p refs
(Contract DAAG46-71-C-0162; DARPA Order 1849)
(AD-A106670; AMMRC-TR-81-14) Avail: NTIS HC A11/MF A01 CSCL 21/5

A goal of 200 hours of engine rig demonstrations for representative duty cycle temperatures in a regenerated vehicular gas turbine was chosen, with uncooled ceramic components to operate at least 25 hours at 2500 F, beyond the temperatures possible with uncooled metal components. The total systems approach included major efforts in ceramic design, materials development, fabrication process development, and test and evaluation methodology. Progress was made in each of these areas during the course of the program. For example, the strength of reaction bonded silicon nitride (RBSN) used in the stator and rotor blades was more than tripled. By the end of the program, 200 hours of duty cycle durability on turbine test rigs (between 1930 F - 2500 F) was attained on RBSN stationary components including stators, nose cones and turbine rotor tip shrouds. Similarly, 200 hours of duty cycling on test rigs was attained with reaction sintered SiC combustors and stators. GRA

A COMPUTER PROGRAM FOR VARIABLE-GEOMETRY SINGLE-STAGE AXIAL COMPRESSOR TEST DATA ANALYSIS (UD0400) Interim Report, 1 Jun. 1980 - 31 May 1981
C. Herbert Law Sep. 1981 147 p refs
(AF Proj. 2307)
(AD-A106676; AFWAL-TR-81-2078) Avail: NTIS HC A07/MF A01 CSCL 21/5

This report describes a computer program that is designed for the analysis of single-stage axial compressor data. The axisymmetric flow of a thermally perfect compressible fluid is assumed, and the streamline curvature method of solution is employed. Details of the blade geometry may be computed or input, and a detailed account of the flow through the blading may be obtained. The analysis is limited to a single-stage compressor, but inlet guide vanes may be included. Variable geometry is permitted in both the inlet guide vanes and the stator vanes. An option in the analysis is to match computed and experimental static pressures at any radius by varying annulus blockage or relative flow deviation angles. Author (GRA)

AN INVESTIGATION OF AUTOMATIC GUIDANCE CONCEPTS TO STEER A VTOL AIRCRAFT TO A SMALL AVIATION FACILITY SHIP
J. A. Sorensen, T. Goka, A. V. Phatak, and S. F. Schmidt Jul. 1980 253 p refs
(Contract NAS2-10288)
(NASA-CR-152407) Avail: NTIS HC A12/MF A01 CSCL 01C

A detailed system model of a VTOL aircraft approaching a small aviation facility ship was developed and used to investigate several approach guidance concepts. A preliminary analysis of the aircraft-vessel landing guidance requirements was conducted. The various subelements and constraints of the flight system are described including the landing scenario, lift fan aircraft, state rate feedback flight control, MLS-based navigation, sea state induced ship motion, and wake turbulence due to wind-over-deck effects. These elements are integrated into a systems model with various guidance concepts. Guidance is described in terms of lateral, vertical, and longitudinal axes steering modes and approach and landing phases divided by a nominal hover (or stationkeeping) point defined with respect to the landing pad. The approach guidance methods are evaluated, and the two better steering concepts are studied by both single pass and Monte Carlo statistical simulation runs. Four different guidance concepts are defined for further analysis for the landing phase of flight. J.M.S.

AUTOMATION OF ON-BOARD FLIGHTPATH MANAGEMENT
Heinz Erzberger Dec. 1981 22 p refs
(NASA-TM-84212; A-8808) Avail: NTIS HC A02/MF A01 CSCL 07C

The status of concepts and techniques for the design of onboard flight path management systems is reviewed. Such systems are designed to increase flight efficiency and safety by automating the optimization of flight procedures onboard aircraft. After a brief review of the origins and functions of such systems, two complementary methods are described for attacking the key design problem, namely, the synthesis of efficient trajectories. One method optimizes en route, the other optimizes terminal area flight; both methods are rooted in optimal control theory. Simulation and flight test results are reviewed to illustrate the potential of these systems for fuel and cost savings. J.M.S.

A PROGRAM TO EVALUATE A CONTROL SYSTEM BASED ON FEEDBACK OF AERODYNAMIC PRESSURE DIFFERENTIALS Final Report
David W. Levy, Paul Finn, and Jan Roskam Dec. 1981 205 p refs
(Grant NAG4-5)
(NASA-CR-163466; KU-FRL-490-2) Avail: NTIS HC A10/MF A01 CSCL 01C

The use of aerodynamic pressure differentials to position a control surface is evaluated. The system is a differential pressure command loop, analogous to a position command loop, where the surface is commanded to move until a desired differential pressure across the surface is achieved. This type of control is more direct and accurate because it is the differential pressure which causes the control forces and moments. A frequency response test was performed in a low speed wind tunnel to measure the performance of the system. Both pressure and position feedback were tested. The pressure feedback performed as well as position feedback implying that the actuator, with a break frequency on the order of 10 Rad/sec, was the limiting component. Theoretical considerations indicate that aerodynamic lags will not appear below frequencies of 50 Rad/sec, or higher. S.L.

STUDY OF GROUND HANDLING CHARACTERISTICS OF A MARITIME PATROL AIRSHIP Contractor Final Report, Oct. 1980 - Mar. 1981
Mar. 1981 280 p refs
(Contract NAS2-10448)
(NASA-CR-166253; GER-16948) Avail: NTIS HC A13/MF A01 CSCL 01E

Mooring concepts appropriate for maritime patrol airship (MPA) vehicles are investigated. The evolution of ground handling systems and procedures for all airship types is reviewed to ensure that appropriate consideration is given to past experiences. A tri-rotor maritime patrol airship is identified and described. Wind loads on a moored airship and the effects of these loads on vehicle design are analyzed. Several mooring concepts are assessed with respect to the airship design, wind loads, and mooring site considerations. Basing requirements and applicability of expeditionary mooring also are addressed. Author

CALIBRATION OF THE AMES ANECHOIC FACILITY. PHASE 1: SHORT RANGE PLAN Final Report, Dec. 1980
David Hickey, Paul T. Soderman, K. Karamcheti, S. P. Koutsoyannis, R. Hopkins, and B. McLachlan Dec. 1980 128 p refs
Prepared in cooperation with Stanford Univ., Calif.
(NASA-TM-84081) Avail: NTIS HC A07/MF A01 CSCL 14B

A calibration was made of the acoustic and aerodynamic characteristics of a small, open-jet wind tunnel in an anechoic room. The jet nozzle was 102 mm diameter and was operated subsonically. The anechoic-room dimensions were 7.6 m by 5.5 m by 3.4 m high (wedge tip to wedge tip). Noise contours in the chamber were determined by various jet speeds and exhaust collector positions. The optimum nozzle/collector separation from an acoustic standpoint was 2.1 m. Jet velocity profiles and turbulence levels were measured using pressure probes and hot wires. The jet was found to be symmetric, with no unusual characteristics. The turbulence measurements were hampered by oil mist contamination of the airflow. Author ments was demonstrated. Application of these improvements will result in a cruise SFC reduction of 0.22 percent for new engines. For high time engines, the improved roundness and response characteristics results in an 0.5 percent reduction in cruise SFC. A basic life capability of the improved HP turbine stator in over 800 simulated flight cycles without any sign of significant distress is shown. E.A.K.

DAMAGE TOLERANT DESIGN FOR COLD-SECTION TURBINE ENGINE DISKS Final Report, Aug. 1977 - Feb. 1981
C. H. Cook, H. E. Johnson, and C. E. Spaeth Wright-Patterson AFB, Ohio AFWAL Jun. 1981 243 p
(Contract F33615-77-C-2064; AF Proj. 3066)
(AD-A107863; PWA-FR-14442; AFWAL-TR-81-2045) Avail: NTIS HC A11/MF A01 CSCL 21/5

This report describes the development, test evaluation, and refinement of a Damage Tolerant Design System for cold-section turbine engine disks. To substantiate the Design System the 42-month effort included the design and test of a functional replacement 2nd-stage fan disk for the F100 engine. This disk would be able to support a 0.030-inch crack for three maintenance intervals without a rapid fracture failure. The program was totally successful and resulted in a disk design that was three pounds heavier than the Bill of Material (B/M) disk but had over ten times the B/M life even with a 0.030-inch crack in the bolthole and a 0.020 inch elox crack starter in the rim slot. Included in this report are the design criteria and rationale used in creation of the damage tolerant configuration, the testing and analysis methodology, and results as well as recommendations for application and improvements. MAINTENANCE POSTURE FOR QUICK START Final Report
John M. Connolly 12 Aug. 1981 46 p
(AD-A107553; SAC/LGME-ER-P-328) Avail: NTIS HC A03/MF A01 CSCL 12/5

Quick start is an aircraft modification which installed cartridge starters on all engines of the B-52G/H and non-fan KC-135 aircraft. Routine peacetime use of the modification was suspended due to an excessive amount of smoke and toxic gases created by the cartridge exhaust. The SAC Aircraft Engineering Division then investigated respiratory and eye protection for ground crew personnel. As an interim solution, they found that an aircraft firefighter's smoke mask connected to a Mine Safety Appliance Corp Type N model SW as filter canister adequately protects the user. To minimize the crew chief's exposure to the smoke cloud, the Division designed and tested a roll-over chock, evaluated a wireless interphone communication system, and implemented alert B-52 battery engine starts. With these new concepts, response timing is only limited to aircrew checklist items and engine start time. GRA

THROUGH FLOW CALCULATIONS IN AXIAL TURBOMACHINES
C. Hirsch, ed. (Vrije Universiteit, Brussels) and J. D. Denton, ed. (Cambridge Univ.) Oct. 1981 330 p refs
(AGARD-AR-175) Avail: NTIS HC A15/MF A01

The objectives were to review the existing information on blade performance and wall effect prediction, and to extend this information by systematic application of numerical methods to representative geometries. Only axial turbomachines were examined and they were split into a turbine sub-group and a compressor sub-group. Axial turbine performance predicted included an examination of the influence of correlations and computational procedures on the prediction of overall efficiency. A comprehensive survey of the various loss and deviation mechanisms was conducted for the compressor sub-group.

INFLUENCE OF CORRELATIONS AND COMPUTATIONAL METHODS ON THE PREDICTION OF OVERALL EFFICIENCY
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 29-31 refs

Avail: NTIS HC A15/MF A01

The process of designing a gas turbine or a steam turbine begins with an evaluation of the influence of component design parameters on the overall cost. For both the steam turbine and the gas turbine, energy costs are rapidly increasing and component efficiency is therefore a primary design objective. For the aircraft gas turbine, the weight of the component influences the fuel consumption and is therefore also an important energy cost consideration. Turbine efficiency predictions, together with information which influence the weight and cost, were obtained from flow field calculations which define the thermodynamic properties and velocity triangles throughout the turbine. These computational methods may be full span through flow calculations which predict the fluid properties from the hub to the tip between each blade row or they may be mean line calculations. In either case they are dependent upon loss and deviation models for their effectiveness in the efficiency optimization stage of the design process. The loss and deviation correlations which are in common use by steam turbine and gas turbine manufacturers are frequently developed internally and are maintained as proprietary information. The overall efficiency predictions which are discussed are therefore limited to results obtained using the correlations built into the methods which are described. T.M.

THE TWO STAGE AERO ENGINE TURBINE
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 69-83 ref

Avail: NTIS HC A15/MF A01

The turbine was a model of the H.P. and I.P. stages of an aircraft gas turbine with the two rotors running at different speeds. It was 'cold flow' tested using air at 420 K and 2.95 bar. Both hot wire and pressure probe instrumentation was used with radial and circumferential traverses after each blade row. The through-flow program used to provide sample results is based on a method of solution for axisymmetric and steady flow in axial turbomachines; it solves the complete radial equilibrium equation - acounting for enthalpy and entropy gradients and streamline curvature effects - in a specified number of stations ahead of and after the blade rows. An orthogonal curvilinear system of coordinates, having the meridional coordinates coincident with the generatrices of the flow stream surfaces, is used in the solution. Overall predicted efficiency is 89.1% of the measured results. T.M.

SURVEY ON DIFFUSION FACTORS AND PROFILE LOSSES
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 115-126 refs

Avail: NTIS HC A15/MF A01

Emphasis is placed upon the development of stage and blade design procedure that will replace the simple loss prediction techniques in use today. These techniques are difficult to apply to real machine design because extensive iterative hub-to-tip, blade-to-blade, and boundary-layer flow calculation is needed. Parametric studies with blade-to-blade flow and boundary layer calculation codes were examined which attempt to refine the diffusion factor concept and loss correlation at design as well as off-design compressor operation. The codes begin to demonstrate how the flow parameters (including Mach- and Re-number) and the details of blade geometry interact to produce performance characteristics. T.M.

END-WALL BOUNDARY LAYER CALCULATION METHODS
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 137-150 refs

Avail: NTIS HC A15/MF A01

The end-wall boundary layer (EWBL) approach to secondary losses is based on the integration of the pitch-averaged three-dimensional boundary layers along the hub and tip walls, with extra assumptions for the blade force defect terms. From there an efficiency drop is calculated including secondary flow effects, as well as blockage. The method allows in principle for the influence of inlet blockage, clearance, axial gap, aspect ratio and other parameters to be included through their effect on the end-wall boundary layers. From the knowledge of the velocity profiles inside the boundary layers, the full radial variations of incidence and turning can be predicted by coupling a radial equilibrium calculation to the EWBL calculation. T.M.

CORRELATION FOR SECONDARY FLOWS AND CLEARANCE EFFECTS
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 151-165 refs

Avail: NTIS HC A15/MF A01

It is concluded that correlations obtained from straight cascade data will at least provide correct trends for the effect of clearance in compressors. With cascade data, the effect of variation of blade circulation with span is not known. This will cause problems if spanwise distributed correction for losses and angle are to be considered. For turbine, it is well known that for secondary flow effect the loss level as obtained from cascade data may differ of an order of magnitude from the machine losses. This is linked most probably to the effect of relative motion when passing from nozzle to rotor or vice-versa. In compressors this effect tends to bring back the end-wall boundary layer to a more collateral state, and the difference might be somewhat less. T.M.

EFFECTS OF REYNOLDS NUMBER AND TURBULENCE LEVEL ON AXIAL CASCADE PERFORMANCE
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 164-170 refs

Avail: NTIS HC A15/MF A01

A semiempirical theory was developed which will predict the behavior of the shear layer across a laminar separation bubble. The method is proposed for two dimensional incompressible flow and is applicable down to short bubble bursting. The method can be used to predict the length of the laminar bubble, the bursting Reynolds number, and the development of the shear layer through the separated region. As such, it is a practical method for calculating the profile losses of axial compressor and turbine cascade in the presence of laminar separation bubbles. It can also be used to predict the abrupt leading edge stall associated with thin airfoil sections. The predictions made by the method are compared with the available experimental data. T.M.

N82-17191# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
SURVEY ON THE EFFECT OF BLADE SURFACE ROUGHNESS ON COMPRESSOR PERFORMANCE
In its Through Flow Calculation in Axial Turbomachines Oct. 1981 p 171-180 refs

Avail: NTIS HC A15/MF A01

Analysis of limited experimental data reveals that critical roughness Reynolds number of compressor blades manufactured with typical present day methods as forging/etching and electrochemical machining are around 90 and therefore very close to sand type roughness if roughness height is based on the largest peaks. Modern high pressure ratio engines suffer from blade surface roughness in the back stages of the compression system. Surface quality needed to keep the flow hydrodynamically smooth exceeds considerably the best present day quality achievable, thus limiting the potential efficiency gain at high Reynolds number flight conditions, i.e., essentially low level flight conditions. L.F.M.

PART SPAN DAMPER LOSS PREDICTION FOR TRANSONIC AXIAL FAN ROTORS
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 181-183 refs

Avail: NTIS HC A15/MF A01

For off design conditions, the maximum loss due to the damper and region of influence at design point are calculated and these values are used as reference quantities for all off design calculations. The point of intersection of a constant throttle or area operating line through the design point with a speed line defines the reference point where the PSD loss is minimum. From this point the suction surface incidence at the damper location is determined from experimental data or off design analysis code. Then the damper maximum loss region of influence is calculated for any point on the speed line by taking the difference in suction surface incidence at that point and the reference incidence. To minimize damper loss, several things should be taken into consideration. Both approaches agree on the following: the damper should be as thin as possible so as to minimize the area influenced; the damper should be located as near to the hub as possible; work input should be minimized at the PSD location. Correlation of experimental results shows further that damper trailing and leading edge thickness should be as sharp as possible. L.F.M.

DEVIATION/TURNING ANGLE CORRELATIONS
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 184-211 refs

Avail: NTIS HC A15/MF A01

In the past, compressor through flow solutions used substantial input from experimental measurements made in actual fan and compressor flow messages or in flows simulating real compressor conditions. For example, almost total reliance was placed on experimentally supported methods for estimation of fluid turning angles in individual blade rows. Compressor design is, as a result, heavily dependent on the quality of the experiment and data correlations associated with these methods. The three principal currently used prediction methods for flow turning angle were developed during the period 1945 to 1960. One of these methods directly predicts fluid turning angles in terms of cascade geometry and aerodynamic parameters. The others predict the exit flow deviation angle, defined as the angle between the average exit flow direction and the direction of a line tangent to the blade section camber line at the trailing edge. There has been no substantial modernization of these deviation/turning angle procedures since 1960, while during this time the methods have been widely applied to airfoil section profiles and in aerodynamic regimes far outside the limits suggested by the original derivations and data correlations. A discussion of these problems is presented. L.F.M.

AXIAL COMPRESSOR STALL AND SURGE
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 212-213 refs

Avail: NTIS HC A15/MF A01

The so called surge line evaluation is an extremely complex area, which deserves in itself full attention. The intention here was only to define the problem. The existing methods of prediction do not take the real physics of the flow into account, and cannot explain or consider or identify all the parameters of importance. They are however quick and useful for the range in which they have been calibrated, but are mostly not available in public literature. A more generalized use of the pseudoend wall boundary layer approach seems interesting. Satisfactory solutions will come however only from the logical approach of instability detection, second flow regime and system response characterization, for which solid elements are now in hand but require further development. L.F.M.

SUMMARY OF ANSWERS TO THE QUESTIONNAIRE
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 214-218 refs

Avail: NTIS HC A15/MF A01

To ascertain better the state of the art, a questionnaire bearing on particular points raised by the general survey paper of Hirsch was prepared and distributed to industry and research groups. Questions concerning compressor loss correlations, flow turning correlations, and secondary and clearance effects were asked. Answers were received from six countries and a summary is presented. without imposing restrictive conditions on the engagement geometry. The design of a Doppler radar system for measuring the miss-distance is considered. The system makes use of the Doppler frequency shift due to the relative velocity between projectile and target to determine the magnitude of the miss-distance. The practical realization of the system measuring concepts is discussed, taking into account aspects of target installation, the antennae, and the ground equipment. The maximum miss-distance which may be determined depends on the size of the projectile. Typical maximum values are 4 m for a 30 mm shell, 11 m for a 114 mm shell, and 15 m for a guided weapon. G.R.

A82-18906 # **Sanctuary radar.** F. L. Fleming (Technology Service Corp., Santa Monica, CA) and N. J. Willis (U.S. Defense Advanced Research Projects Agency, Arlington, VA). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 103-108. Army-USAF-supported research.

This paper describes the Sanctuary bistatic radar test bed and fundamental technical issues addressed in the test program. It outlines the choice of waveform and digital signal processor configuration, which performs both Doppler filtering and pulse compression in the frequency domain. It explains clutter suppression techniques, including those involving real-time software control of the digital processor. Finally, it summarizes flight test objectives and results obtained during initial system tests with the airborne transmitter. (Author)

A82-18908 **Recent developments in military telemetry.** R. G. A. Marzolini (EMI Electronics, Ltd., Feltham, Middx., England). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 123-128.

Developments regarding UK guided weapon telemetry systems following World War II are examined. Analog systems operating in the frequency band from 430 to 450 MHz were replaced in the 1960's by the Type 4650 Variant I and Variant II systems. In the early 1970's, due to the expansion of private mobile radio services, military telemetry moved to new allocations in the frequency band from 1430 to 1450 MHz. The change in frequency operation is to be completed by Jan. 1, 1981. This change in carrier frequency affected the systems which would be allowed to operate in the new band, and one resulting development was the Type 1440 (PAM/FM/FM) system. In parallel with this carrier frequency change the development of digital telemetry in the form of the Type 109 (PCM/FM) system commenced. Attention is given to details regarding carrier frequency, FM transmitters, PCM encoders, standards, and a flight proving trial. G.R.

A82-18911 **Microwave communications to remotely piloted vehicles.** M. R. B. Dunsmore and S. E. Gibbs (Royal Signals and Radar Establishment, Malvern, Worcs., England). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 141-148.

Remotely piloted vehicles (RPVs) rely on two-way communication links to return data from their surveillance sensors to their ground control stations and to receive data for monitor and control operations. The requirements of a data link are examined, and a data link design for meeting these requirements is discussed. It is found that RPV data links are constrained to operate in or above the microwave frequency bands, typically G or J bands. The information (video) bandwidth is considered along with channel bandwidths, the operating range, antenna patterns, receiver sensitivity, and transmitter power. The vulnerability of RPV data links to electronic countermeasures (ECM) is evaluated, taking into account also remotely piloted helicopters. G.R.

A82-18914 # **L-band power generation in the General Electric solid-state radar.** G. B. Sleeper (General Electric Co., Syracuse, NY). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 199-205.

A solid-state, L-band air defense radar is discussed. The considered radar is entirely computer controlled. By handling the energy management problem with a computer in real time, it is possible to exploit fully the high-duty-cycle capability of solid-state power generation. An approach combining computer and solid-state device technologies provides a number of advantages related to high reliability, long operational life, graceful degradation, and low maintenance costs. Attention is given to the array configuration, aspects of array phase calibration, row transmitters, the array transmitter, the power modules, the DC power supply transmit/receive switching, and phase shifting for both transmit and receive. G.R.

A82-18917 **R.F. calibrators for Doppler radars.** T. Billing and P. A. R. Holder (EMI Electronics, Ltd., Wells, Somerset, England). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 245-250. Research supported by the Ministry of Defence (Procurement Executive).

This paper deals with the problem of achieving reliable calibration of Doppler radars. Calibration with a simulator at constant range is examined for two practical cases: in a radar trials situation, where the simulator is placed at a distance for a line-of-sight type calibration; and in the laboratory, where a simulator is connected directly to the radar and where the range delay is simulated. (Author)

A82-18920 # **Automatic controlled terrain following flights.** R. Rode and A. Hessel (Messerschmitt-Bölkow-Blohm GmbH, Munich, West Germany). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 275-280.

Three low-level flying modes are named: terrain-following, terrain-avoidance, and terrain-clearance. Because the terrain avoidance mode is difficult under bad weather conditions and because the terrain-clearance mode is unacceptable with regard to vulnerability, the terrain-following mode is regarded as an acceptable compromise. Block diagrams describing this system are given. It is noted that the system is based on a scanning forward looking radar which, together with other sensors, operates in a closed loop with an automatic flight control system. The radar scans the terrain ahead of the aircraft; the computer then calculates a vertical acceleration based on this information which is then used by the autopilot and flight control system to keep the aircraft on its required flight path. C.R.

A82-18934 # **Octave bandwidth dual polarized antenna.** C. Nicolai, R. Scarpetta, and P. Russo (Selenia S.p.A., Pomezia, Italy). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 417-421.

It is noted that the requirements in the design of ECM antennas become harder to meet for the lower operating microwave frequency band (S or L). A crossed dipole in the short backfire configuration with high performance over more than a 2:1 frequency band is described. Wideband operation is achieved by a proper design of the dipoles and cavity geometry and of the feeding baluns and sleeves. The dipole length and the distance from the cavity are, respectively, about 1/2 and 1/4 of the wavelength at the center frequency. It is noted that radiation patterns optimization and control are possible by varying the sleeves and the back cavity geometry. Good amplitude and phase pattern optimization is achieved with the circular sleeves geometry and the polygonal cavity geometry. C.R.

A82-18936 # **Microwave systems for radar guided missiles.** M. F. Godfrey (Marconi Space and Defence Systems, Ltd., Stanmore, Middx., England). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 433-438.

The importance of the microwave components in radar homing heads is stressed, noting that it is these components which condition the radar signal for the signal-processing unit. The difference between the coherent and incoherent radars used in guided weapons is discussed. Attention is also given to semiactive and active incoherent radars. It is noted that a coherent transmitter must provide mean powers of up to 1 kW, depending on the application, at duty ratios of up to 50% and with pulse repetition rates which may be as high as 500 kHz. The dc to microwave efficiency should be more than 20%. Incoherent transmitters must provide peak powers above 50 kW at duty ratios of 0.1%. C.R.

A82-18937 # **A terminal guidance simulator for evaluation of millimeter wave seekers.** A. J. Witsmeer and K. L. Wismer (Boeing Aerospace Co., Seattle, WA). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 445-451.

A theoretical and physical description is given of a simulator for evaluating passive terminal guidance seekers operating in the millimeter region 10-100 GHz. Attention is also given to the expansion of the present facility into the active regime. It is noted that the chamber may be the only one of its kind in the world. A feature that makes it unique is the use of aluminum foil to reflect the excess microwave energy out of the room through a skylight. In effect, this makes the walls appear cold like the sky background so that the seeker sees only the array with its picture of the target scene. C.R.

A82-18940 # **Airborne measurements with a sensitive high resolution 90 GHz radiometer.** K. Grüner and B. Aumiller (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Hochfrequenztechnik, Oberpfaffenhofen, West Germany). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 473-480.

Design criteria and realized configurations of sensitive, high-resolution airborne 90 GHz radiometer used in low-altitude flights are described. Selected results of the first test measurements are given. The receiver front end comprises an antenna scalar feed horn and a GaAs single-ended Schottky mixer with an integrated first-stage FET-IF-amplifier mounted in an evacuated compartment and cooled to 23 K by a two-stage temperature-controlled helium refrigerator. Among the characteristics are an RF input frequency of 83.9-85.1 and 90.9-92.1 GHz, an IF band of 2.9-4.1 GHz, and a scan angle of plus or minus 14.5 deg. C.R.

A82-18942 # **A study of potentially low cost millimetre-wave radiometric sensors.** S. J. Nightingale and R. N. Bates (Philips Research Laboratories, Redhill, Surrey, England). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 486-491. 7 refs.

Some of the design considerations for a radiometric sensor are examined with a view to developing a compact, lightweight unit which would be cheap to produce. The construction and performance of a 35 GHz Dicke radiometer are described. The r.f. components are made with 'E' plane circuitry, which makes it possible to realize a variety of different transmission structures, for example, finline, microstrip, and coplanar waveguide. It is noted that the r.f. and i.f. circuit techniques discussed here can also be used to make similar units operating at frequencies up to at least 100 GHz. C.R.

A82-18943 **Radiometric measurements at 80 GHz.** S. E. Millard, K. O. Rossiter, and G. R. Selby (EMI Electronics, Ltd., Wells, Somerset, England). In: Military microwaves '80; Proceedings of the Second Conference, London, England, October 22-24, 1980. Sevenoaks, Kent, England, Microwave Exhibitions and Publishers, Ltd., 1981, p. 492-497. Research sponsored by the EMI Electronics, Ltd. and Royal Signals and Radar Establishment.

The radiometer system employs the Dicke-switch principle with a 50% duty ratio but also incorporates an additional reference load which can replace the antenna for calibration purposes. Each load is maintained at a certain temperature by immersion in a dewar together with either ice (273 K) or solid CO2 (195 K). It is noted that, in addition, the overall system can be calibrated and the gain checked by fitting small 'black body' cones filled with either ice or solid CO2 over the antenna feed. The measurements made at 81 GHz show acceptable contrasts between a variety of metal targets and characteristic backgrounds for various weather conditions. To the extent that they have been analyzed to date, the measurements confirm that a center frequency in the range 75-90 GHz is acceptable for all-weather operation. They also emphasize the need for both vertical and horizontal polarization measurements to discriminate between metallic and wet, nonmetallic surfaces. C.R.

A82-18975 † **Airport radar systems (Radiolokatsionnye sistemy aeroportov).** L. T. Perevezentsev, A. V. Zelenkov, and V. N. Ogarkov. Moscow, Izdatel'stvo Transport, 1981. 384 p. 27 refs. In Russian.

The design principles of ground-based radar systems for civil aviation are presented along with techniques for implementing these principles and structural and operational characteristics of airport radar systems. Consideration is given to transmitter, receiver, and feed design, and to MTI systems, the primary processing of radar data, the interpretation and processing of secondary radar data, and radar display techniques. B.J.

A82-18996 † **Aircraft electrical equipment - Design and operation (Elektrooborudovanie samoletov - Ustroistvo i ekspluatatsiia).** A. P. Barvinskii and F. G. Kozlova. Moscow, Izdatel'stvo Transport, 1981. 280 p. In Russian.

Design principles and circuit designs are presented for a variety of aircraft electrical systems. Particular consideration is given to ac and dc generators in aircraft power supply systems, and to the electromechanical drive equipment. Various electrical control systems are also examined, including engine starting, fuel control, antiicing, lighting, and fire extinguishing. B.J.

A82-19001 **Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports (Die Luftrettung: Ergebnisse, Analysen, Entwicklungen; Internationaler Luftrettungs-Kongress, 1st, Munich, West Germany, September 16-19, 1980, Berichte).** Congress sponsored by the Allgemeiner Deutscher Automobil-Club. Edited by H. H. Atrott. Munich, Allgemeiner Deutscher Automobil-Club, 1981. 503 p. In German and English.

A survey of aeromedical evacuation services throughout the world is provided, taking into account conditions in Switzerland, Austria, France, Norway, Great Britain, Italy, West Germany, Belgium, Sweden, Spain, the United States, Australia, East Africa, South Africa, Argentina, Chile, New Zealand, and Bahrain. Subjects related to organization, legal and financial bases are investigated, giving attention to basic guidelines for a helicopter ambulance service, an air emergency service, a universal system for the identification of emergency vehicles, marketing the hospital-based helicopter system in a free enterprise environment, and limitations and developments of commercial schedule airline flights for the carriage of invalid passengers. Other topics explored are related to aviation medicine, flight guidance and control systems, the training of aeromedical evacuation personnel, and medical and technical requirements for aircraft and equipment. G.R.

A82-19002 **The marketing, organisation and financing of aeromedical evacuation by a motoring organisation.** A. J. Whitaker (British Automobile Association, Basingstoke, Hants., England). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 71, 72.

The features and effectiveness of a British automotive club aeromedical insurance plan for travellers in Europe, North Africa, and Turkey are described. The plan is sold through banks, travel agents, and service centers, and the service is provided by an amubulance organization with an aeromedical wing. A central communications base can dispatch emergency air services for transport back to Britain in case of accident or illness, using either

péenne ETW - Etat actuel). J. P. Morel (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Association Aéronautique et Astronomique de France, Colloque d'Aérodynamique Appliquée, 18th, Poitiers, France, Nov. 18-20, 1981.) ONERA, TP* no. 1981-121, 1981. 24 p. 5 refs. In French.

An interim report on the design for a European Transonic Wind Tunnel, being built by the cooperative efforts of West Germany, Britain, and the Low Countries is presented, and details of the partially completed prototype wind tunnel are provided. The ETW will be a cryogenic, nitrogen gas installation for examining flows at high Reynolds numbers, and consultations are continuing with NASA on the cryogenic technology. The full test channel will have a 2.4 x 2 sq m cross section, with a pressure variance between 1.25-4.5 bars. Temperatures will range from 120-168 K at Mach numbers up to 1.7, and equipment altering the incidence angle of test models at a rate of four deg/sec is intended. A pilot ETW is under construction, with a cross-section of 0.27-0.23 m, and is being used to verify the aerodynamic performance of the flow circuit, the responses to Mach number, pressure, and temperature, and the control circuits. M.S.K.

A82-19738 # **Aerodynamics of a transport aircraft-type wing-fuselage assembly (Aérodynamique d'un ensemble voilure-fuselage du type 'Avion de transport').** V. Schmitt (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Association Aéronautique et Astronautique de France, Colloque d'Aérodynamique Appliquée, 18th, Poitiers, France, Nov. 18-20, 1981.) ONERA, TP* no. 1981-122, 1981. 24 p. 19 refs. In French.

This study, carried out at ONERA, is based on the DFVLR-F4 wing-body combination. The 1/38 model is formed by a 9.5 aspect ratio transonic wing and an Airbus A 310 fuselage. After a description of the F4 wing geometrical characteristics, main experimental results obtained in the S2MA wind tunnel are discussed. Both wing-fuselage interferences and viscous effects, which are important on the wing due to a high rear loading, are investigated. In order to do that three-dimensional calculations are performed; an attempt is made to find their limitations. (Author)

A82-19740 # **Three-dimensional calculation of the flow in helicopter air intakes (Calculs tridimensionnels de l'écoulement dans les prises d'air d'hélicoptères).** B. Boizard (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Association Aéronautique et Astronautique de France, Colloque d'Aérodynamique Appliquée, 18th, Poitiers, France, Nov. 18-20, 1981.) ONERA, TP* no. 1981-124, 1981. 14 p. In French. Research supported by the Direction des Recherches, Etudes et Techniques.

The results of an ONERA-initiated investigation to optimize the efficiency of helicopter air intakes and minimize the aerodynamic drag are reported. A method of singularities was used to study the internal flow in the air intakes, with the flow considered as incompressible and the air as an ideal fluid. The walls of the intake were discretized into quadrilateral facets for solution of a series of linear equations in a computer. The velocity fields induced by the facets were obtained for the intensities of the calculated doublets. The air intake during hovering and acceleration are modeled for two existing aircraft, and the necessity of accounting for viscous effects in future programs is indicated. M.S.K.

A82-19784 * # **Control law development for a close-coupled canard, relaxed static stability fighter.** R. W. Klein, M. Lapins, R. P. Martorella, and M. Sturm (Grumman Aerospace Corp., Bethpage, NY). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0180.* 20 p. Contract No. NAS1-16636.

The performance benefits to be gained from relaxed static stability (RSS) are illustrated for $M = 0.9$ and $M = 2.0$ flight conditions. The longitudinal, directional, and lateral control system structure is developed. The effect of static margin, bandwidth, and canard-wing interaction on canard rate requirements is analyzed. Control and maneuver limiter functions are developed and implemented about all three axes; simulation results strikingly demonstrate the concomitant improvement in energy management and improved resistance to departure and spin. C.R.

A82-19786 * # **An analytical technique for the analysis of airplane spin entry and recovery.** L. W. Taylor, Jr. and G. K. Miller, Jr. (NASA, Langley Research Center, Flight Dynamics and Control Div., Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0243.* 9 p. 10 refs.

The dynamic equations of motion for a spinning airplane are simplified to facilitate the analysis of spin entry and recovery maneuvers. Solutions of a nonlinear, first order equation for spin rate enable calculation of spin entry and recovery times and control required for recovery. The analysis is applied to a light airplane for which both aerodynamic data, rotory balance wind tunnel tests, and spin flight test data have been obtained. A comparison of predicted and actual transient spin responses is made which supports the validity of the analytical approach taken but which also illustrates the difficulty in obtaining accurate aerodynamic data for spinning airplanes. Certain normalized parameters of the reduced state spin equation suggest criteria for assessing the transient spin characteristics of light airplanes. (Author)

A82-19791 # **The sooting tendency of fuels containing polycyclic aromatics in a research combustor.** D. W. Naegeli, L. G. Dodge, and C. A. Moses (Southwest Research Institute, San Antonio, TX). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0299.* 11 p. 21 refs.

An investigation regarding soot formation has been conducted for a variety of jet fuels, taking into account a wide range of combustor conditions covering the operating envelopes of many gas turbine engines. The results demonstrate that the dominant soot formation mechanisms in gas turbine engines are dependent on operating conditions. There are evidently a number of competing soot formation and oxidation steps whose relative importance varies with inlet air temperature, reference velocity, and fuel/air ratio. Under some operating conditions the sooting tendency is significantly affected by polycyclic aromatics including tetralin, but the H/C ratio is the principal correlating parameter. At high power conditions where soot formation is of greatest concern, the fuel/air ratio of most engines is high (0.02), and there is little sensitivity to polycyclics. G.R.

A82-19796 * # **Experimental studies of the Eppler 61 airfoil at low Reynolds numbers.** T. F. Burns and T. J. Mueller (Notre Dame, University, Notre Dame, IN). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0345.* 12 p. 15 refs. Research sponsored by the University of Notre Dame; Grant No. NsG-1419.

The results of an experimental study to document the effects of separation and transition on the performance of an airfoil designed for low Reynolds number operation are presented. Lift, drag and flow visualization data were obtained for the Eppler 61 airfoil section for chord Reynolds numbers from about 30,000 to over 200,000. Smoke flow visualization was employed to document the boundary layer behavior and was correlated with the Eppler airfoil design and analysis computer program. Laminar separation, transition and turbulent reattachment had significant effects on the performance of this airfoil. (Author)

A82-19797 * # **Numerical solution of three-dimensional unsteady transonic flow over wings including inviscid/viscous interactions.** D. P. Rizzetta and C. J. Borland (Boeing Military Airplane Co., Seattle, WA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0352.* 37 p. 30 refs. Contract No. NAS2-10762.

A method is presented for computing the unsteady three-dimensional transonic flowfield about twin wings of arbitrary planform and section geometry including the effects of inviscid/viscous interaction. Dominant effects of the shock-boundary-layer interaction are accounted for by a simple empirically defined model, while viscous regions adjacent to the wing surface and along the trailing wake are described by a set of integral equations appropriate for two-dimensional turbulent flows. The validity of the proposed method is verified by comparison with steady three-dimensional experimental data and a solution of more exact equations for a typical transport wing configuration. V.L.

A82-19798 * # **Unsteady lifting-line theory with applications.** A. R. Ahmadi (Bolt Beranek and Newman, Inc., Cambridge, MA) and S. E. Widnall (MIT, Cambridge, MA). *American Institute of*

Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0354. 21 p. 32 refs. Research supported by the Bolt Beranek and Newman, Inc.; Grant No. NGR-22-009-818.

Unsteady lifting-line theory is developed for a flexible unswept wing of large aspect ratio oscillating at low frequency in inviscid incompressible flow. The theory is formulated in terms of the acceleration potential and treated by the method of matched asymptotic expansions. The wing displacements are prescribed and the pressure field, airloads, and unsteady induced downwash are obtained in closed form. Sample numerical calculations are presented. The present work identifies and resolves errors in the unsteady lifting-line theory of James and points out a limitation in that of Van Holten. Comparison of the results of Reissner's approximate unsteady lifting-surface theory with those of the present work shows favorable agreement. The present work thus provides some formal justification for Reissner's ad hoc theory. For engineering purposes, the region of applicability of the theory in the reduced frequency-aspect ratio domain is identified approximately and found to cover most cases of practical interest. (Author)

A82-19801 # **Real gas flows over complex geometries at moderate angles of attack.** S. Swaminathan, C. H. Lewis (Virginia Polytechnic Institute and State University, Blacksburg, VA), and M. D. Kim. *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0392.* 22 p. 12 refs.

Numerical simulation of supersonic and hypersonic flows over arbitrary geometries at moderate angles of attack is presented in this paper. The different geometries considered for analysis include a slab delta wing, a sphere-cone-cylinder-flare, a blunt-nosed inlet and a 7-degree half-angle sphere-cone. The three-dimensional flowfields over these geometries are analyzed by a parabolized Navier-Stokes code (HYTAC) and a new viscous shock-layer code (VSLET), and the results are compared. Both laminar and turbulent flowfield results for both perfect gas and equilibrium air are presented. In general the surface pressure distributions are in good agreement whereas the heat-transfer results differ depending on the differencing scheme used in the calculation of gradients and turbulent modelling. Aerodynamic force and moment coefficients are presented for some typical cases. Computing times for various test cases are presented. (Author)

A82-19810 † **Aerodynamic characteristics of waveriders at subsonic flight speeds (Aerodinamicheskie kharakteristiki Lambda-kryl'ev na dozvukovykh skorostiakh poleta).** V. I. Voronin and A. I. Shvets. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza,* Nov.-Dec. 1981, p. 104-109. 10 refs. In Russian.

Theoretical and experimental results are presented on the aerodynamic characteristics of two series of waverider models, differing in dihedral angle and sweep angle. The method of discrete vortices was used to analyze the characteristics of thin triangular-platform waveriders. Theoretical results were compared with experimental data on thin waveriders with a relative thickness up to 3%; wind tunnel tests were carried out in the 0.4-0.8 Mach number range. B.J.

A82-19813 † **Analysis of an ideal-fluid flow past a finite-thickness wing (Raschet obtekaniia kryla konechnoi tolshchiny ideal'noi zhidkost'iu).** A. A. Zaitsev and A. D. Khamzaev. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza,* Nov.-Dec. 1981, p. 124-131. 12 refs. In Russian.

A numerical analysis of potential flow past a finite-span wing is carried out using a piecewise-linear approximation of the unknown functions with respect to wing span. In the nonlinear problem the vortex sheet is represented as vortex threads, while in the linear problem it is represented as vortex threads and as a vortex surface. An aerodynamic analysis of swept-wings of finite thickness is presented, and theoretical results are compared with experimental data. B.J.

A82-19814 † **The design of compact asymmetric maximum-thrust nozzles for a given lift force (O postroenii kompaktnykh nesimmetrichnykh sopl maksimal'noi tiagi pri zadannoi pod'emnoi sile).** A. I. Rylov. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza,* Nov.-Dec. 1981, p. 132-136. 7 refs. In Russian.

Kraiko's (1979) indeterminate-control-contour method is used to solve the variational design problem for an asymmetric supersonic plane maximum-thrust nozzle for a given lift force and given size constraints. It is shown that the present problem is equivalent to the maximum thrust problem (with the absence of the lift-force constraint) in a coordinate system that differs from the original system by a certain angle of rotation. Numerical calculations are presented which illustrate the influence of the lift force on nozzle geometry and thrust. B.J.

A82-19868 **X-band vs C-band aircraft radar - The relative effects of beamwidth and attenuation in severe storm situations.** P. H. Hildebrand, R. A. Oye, and R. E. Carbone (National Center for Atmospheric Research, Boulder, CO). *Journal of Applied Meteorology,* vol. 20, Nov. 1981, p. 1353-1361. 21 refs. U.S. Bureau of Reclamation Contract No. 7-07-83-V001; NSF Grant No. ATM-78-27420.

A simulation of X-band and C-band radar is given, with consideration of the effects of attenuation and beamwidth on measurements of radar equivalent reflectivity factor. Two tornadic storms were examined, to determine the ability of radar to adequately show a safe path through a storm. Historical data were acquired and attenuated for the radar wavelength chosen, filtered in azimuth, elevation, and range desired according to the radar beamwidth and pulse depth desired, and filtered in threshold on the basis of received power in order to approximate the simulated radar sensitivity. It was found that X-band radar can provide incorrect information in severe convective storms, while C-band radar is more accurate in severe storm penetration, especially with sampling at 1/3-1/4 beamwidth intervals. The results are noted to hold significance for both operational and research airborne radar use. M.S.K.

A82-19928 † **Automated calculation of the stressed state of shell systems under asymmetrical mechanical and thermal loading (Ob avtomatizatsii rascheta napriazhennogo sostoianiia obolochechnykh sistem pri nesimmetrichnykh silovykh i teplovykh vozdeistviiakh).** Ia. M. Grigorenko, G. I. Genkin, N. D. Draigor, E. T. Fedorova, and V. N. Khoroshilov (Akademiia Nauk Ukrainskoi SSR, Institut Mekhaniki, Kiev, Ukrainian SSR). *Prikladnaia Mekhanika,* vol. 17, Dec. 1981, p. 49-56. In Russian.

Problems related to the computer calculation of the strength of structural elements of aircraft engines are presented. The engines are considered to be elastic systems, composed of various shells of revolution, which are under the effects of non-axisymmetrical mechanical and thermal loads, as well as boundary forces and moments. The calculated values are found to be in good agreement with experimental results. J.F.

A82-19947 **Consequences of American airline deregulation Legislative theory in a concrete example (Auswirkungen der amerikanischen Airline Deregulations - Gesetzgebungslehre an einem konkreten Beispiel).** R. H. Weber. *Zeitschrift für Luft- und Weltraumrecht,* vol. 30, Dec. 1981, p. 333-348. 52 refs. In German.

The Airline Deregulation Act of 1978 is discussed in terms of its impact on American and international air commerce. Major advantages and disadvantages are presented, including a lower cost of flying for the consumer and efficient and profitable air route structures on the one hand and the reduction of safety standards and the creation of operational and financial instability for airlines on the other. Consequences of deregulation in the American market include the establishment of a tariff, a reduction of service for smaller airports, and an increase in small commuter aircraft which run a greater accident risk, especially at take-off and landing. The impact of the tariff on international air traffic is discussed, and a comprehensive evaluation of the Deregulation Act is given. It is concluded that innovation in the airline industry will play a larger role due to increased competition resulting from the deregulation. D.L.G.

A82-19958 # **Subsonic and transonic roll damping measurements on Basic Finner.** H. S. Murthy (National Aeronautical Laboratory, Bangalore, India). *Journal of Spacecraft and Rockets,* data was evaluated for deviation from a preset flight path and for the number of fix points contained in photographs from forward and downward looking cameras. The terrain following subsystem ensures a safe flightpath down to 200 ft altitude, and was evaluated by photographs of the ground and by radar altimeter data. The instrumentation monitoring routing is described, and modifications to correct deficiencies are indicated. M.S.K.

A82-20761 **Design, development and flight testing of a jet powered sailplane.** B. S. Smith (Caproni Vizzola Costruzioni Aeronautiche S.p.A., Vizzola Ticino, Italy). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 14-1 to 14-17. 15 refs.

The design and development of the tadpole-shaped, turbojet powered A21 powered glider are discussed. The necessity of broadening the fuselage to house the jet led to the use of two wheels on the central core structure, which furnishes greater runway handling stability. An aspect ratio of 25.65 is used for the all-metal wings, and an engine 0.3 m in diameter, 0.61 m long, and weighing 30 kg was installed to provide take-off thrusts of 100 kg. A bifurcated exhaust was fitted to avoid having the exhaust impinge on the tail section, and the engine compartment was lined with steel and titanium as a heat limiter. The plane has been flown at speeds up to 190 knots at altitudes exceeding 33,000 ft without experiencing flutter. M.S.K.

A82-20762 **Performance flight test evaluation of the Ball-Bartoe JW-1 Jetwing STOL research aircraft.** R. D. Kimberlin (Tennessee, University, Tullahoma, TN). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 16-1 to 16-20.

The initial steps of the flight test program for the Ball-Bartoe JW-1 Jetwing aircraft are reported. The jet wing vents all engine air through the front of the wing and ejects it over the top of the wing through a slot nozzle which extends 70% of the full wing span. A Coanda flap is mounted at the trailing edge of the blown wing section, and a smaller wing is mounted above the slot nozzle to provide thrust augmentation. The initial series of tests, which followed 78 previous flight tests, comprised pilot familiarization flights, airspeed calibration, thrust calibration, and V-gamma maps. Sawtooth climbs were found to facilitate data collection due to longitudinal instability in level acceleration, and thrust losses amounting to 15-20% were experienced from the ducting. Further design iteration to reduce the ducting thrust losses is indicated. M.S.K.

A82-20763 * **Analysis of flight test measurements in ground effect.** E. K. Parks (Arizona, University, Tucson, AZ) and R. C. Wingrove (NASA, Ames Research Center, Aircraft Guidance and Navigation Branch, Moffett Field, CA). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 17-1 to 17-26. 13 refs.

Three sources of errors, introduced into the air-data measurements of altitude and airspeed as a result of ground proximity, are evaluated. It is shown that the primary error results from ground constraint of the wing lifting pattern. Smaller errors result from constraint of the flow over the fuselage and of the engine exhaust. Equations are derived to provide corrections for the three error contributions. The equations are general and can be applied to airplanes of different geometries operating in different conditions. Applications illustrating different types of flight operations (takeoff and landing) are presented using CV-990 data. Applications illustrating the effect of different static orifice locations (fuselage and nose-boom) are presented with YC-15 data. Finally, an application to trajectory reconstruction is illustrated using DC-10 data. (Author)

A82-20764 **A study of the suitability of the all fiberglass XV-11A aircraft for fuel efficient general aviation flight research.** G. Bennett (Mississippi State University, Mississippi State, MS). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980.
Lancaster, CA, Society of Flight Test Engineers, 1980, p. 18-1 to 18-15. 8 refs.

The impact of rapidly rising fuel prices upon future general aviation aircraft requirements is explored. The current configuration of the fiberglass XV-11A aircraft is presented and it is shown that the aircraft can become a cost effective testbed for fuel efficient general aviation aircraft configurations. Several suitable research tasks for the aircraft are defined. A low cost method to produce master wing molds is proposed. (Author)

A82-20765 **A comprehensive flight test flyover noise program.** J. W. Vogel (Lockheed-California Co., Flight Analysis Dept., Palmdale, CA). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 19-1 to 19-19.

Preliminary results from a program to develop noise prediction methods from static tests which are applicable to flyover noise levels are presented. The program was developed to provide a data base for future certification, customer requirements, and engine modifications, and involved a Lockheed L-1011 with a Rolls-Royce RB.211 engine. Noise level modifications were observed to be possible by altering the power plant components, the airframe, the effects of the jet-flow on the flaps, and forward velocity. Flyovers were performed over microphones on the ground at heights of 300 and 600 feet at various speeds and with the flaps in varying positions, taking into consideration different configurations of climb or descent. Engine noise was found to dominate in the rear arc while airframe noises were dominant in the forward arc, and either flap or landing gear deployment enhanced the sound levels by up to 8 dB. M.S.K.

A82-20766 **Size reduction flight test airborne data systems.** J. W. Gierer (McDonnell Aircraft Co., St. Louis, MO). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980.
Lancaster, CA, Society of Flight Test Engineers, 1980, p. 20-1 to 20-7.

A redesign of flight test data gathering systems to fit into the removable avionics areas of the F-18 aircraft is outlined. The use of low-power digital data recorders offers a size reduction of 2.2:1, with connections being accomplished by means of aircraft style connectors, lowering the number of connectors, and multiplexing where possible. A system design is presented which features subsystems for local and remote control panels, 8 MHz bandwidth helical scan recording on each channel, and time division multiplexing. Other aspects include a 28 V dc transformer rectifier, electronic packaged video, film, flutter excitation, and signal conditioning equipment, a 40 W transmitter, and low-power ICs. The system is intended for use on eight of the nine test F-18 aircraft. M.S.K.

A82-20767 **Data systems organization - A change for the better.** R. D. Samuelson (McDonnell Aircraft Co., St. Louis, MO). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980.
Lancaster, CA, Society of Flight Test Engineers, 1980, p. 21-1 to 21-7.

The implementation of a data systems organization at McDonnell Aircraft is described in terms of the project and departmental bases for the F-15 program. Key objectives of the flight test reorganization comprised strengthened control over data and instrumentation programs, combination of data and instrumentation operations to broaden individual responsibilities and increase efficiency, manage the data system development and the test support activities separately, combine data and instrumentation design activities, and combine supporting laboratories and supply operations where feasible. The data systems were divided into a design and development branch, an operations branch, and a processing and support branch, with respective subsections. The system carried through to F-18 development and resulted in a reduction of 20% in total expenditures. M.S.K.

A82-20768 **Simulator data test instrumentation - Flight test challenge of the eighties.** W. L. Curtice, III (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 22-1 to 22-22.

The development of a Simulator Data Test Instrumentation System (SDTIS) to compare flight test data with results from simulator tests is examined. The SDTIS features 180 channels of digital or analog signal data, TV camera, audio from voice recordings, in-field automatic data reduction and analysis. The problem of matching appropriate cues in response to pilot control actions in the simulator are explored, including the time of aircraft response. The SDTIS allows the matching of the simulator response data regarding time, magnitude, and accuracy against flight data from the aircraft which is simulated. The simulator signals recorded comprise analog signals, digital signals, motion sensors, a g-suit pressure sensor, external-follow-up sensors, control force sensors, and TV cameras. All signals are formatted through a data encoder/decoder, and the necessity for maintaining up-to-date flight test data bases for simulator fidelity measurements is stressed. M.S.K.

A82-20769 **The Boeing Flight Test Data System 1980.** G. J. Zanatta (Boeing Commercial Airplane Co., Seattle, WA). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 23-1 to 23-15.

The Boeing Flight Test Data System is reviewed, with particular attention to the testing of the 757/767 aircraft. The System provides calibration, conditioning, monitoring, recording, extraction, analysis, manipulation, and reporting of data from aircraft tests. The data gathering system is based on pulse code modulation technology, with data routing and switching allowing up to 800 samples/sec. The airborne data analysis and monitor system is outlined, as is the ground analysis, telemetry analysis, and data processing ground stations. The interactive mainframe data base provides access for software users for data base applications, test data processing, and scientific programs. Provisions are made for floppy disk storage for on-board comparisons. The interactive process of engineer-to-computer eliminates manual data searches or searches for test data requirements. M.S.K.

A82-20770 **Instrumentation remote 'mini' ground station.** J. Nixon (Boeing Commercial Airplane Co., Seattle, WA). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 24-1 to 24-7.

The methods of decentralizing the data processing for individual, remote aircraft testing at Boeing, and still making the central processing station available to the instrumentation engineer are described. A preflight instrumentation package is developed before testing, checked, and placed on-line with a ready signal to the central processing computer via a remote terminal CRT. The ready response yields a return of a mylar tape to program the ROMs for data acquisition, thus eliminating any ground traffic for flight test information materials. The system can operate from anywhere a modem system can be used, and it is noted that three systems are intended as mobile units, for carriage to areas where remote access is required. M.S.K.

A82-20771 **Color graphics based real-time telemetry processing system.** T. M. Randall (Lockheed-Georgia Co., Engineering Data Systems Dept., Marietta, GA). In: Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980. Lancaster, CA, Society of Flight Test Engineers, 1980, p. 25-1 to 25-15.

Features of the Lockheed real-time telemetry data processing system for monitoring flight test data acquisition and performing interactive analyses of test results are detailed. All calibration, correction, and conversion to engineering units are performed by the on-board PCM acquisition system, and the main man/machine interface on the ground is a raster scan color graphics display terminal. A scrolled time history format has been developed for use in the testing of the stretch C-141B, and data from tests is subject to analysis two to three minutes after test completion. The system eliminates trial-and-error data acquisition and piecemeal data processing, resulting in increased efficiency and attendant lowered costs, provided that appropriate software is available to utilize the system. M.S.K.

A82-20792 * # **Flow visualization using a computerized data acquisition system.** R. Gallington and G. Sisson (U.S. Air Force Academy, Colorado Springs, CO). In: International Symposium on Flow Visualization, Bochum, West Germany, September 9-12, 1980, Preprints of Contributed Papers. Bochum, West Germany, Ruhr-Universität Bochum, 1981, p. 134-141. 5 refs. NASA-supported research.

A computer-driven traversing mechanism combined with mass data storage, data reduction programs, and general-purpose graphics programs permits a visualization of complex flows. A unique seven-hole probe is used which permits reasonably accurate measurements of all average flow properties if the local flow angle does not exceed 80 degrees. A description is given of the wake of a lifting canard surface as this wake passes over a wing. The flow includes concentrated and dissipating vortices, large regions of reduced total pressure, and local flow angles up to 60 deg. All these features can be clearly seen and accurately located in the graphical output. C.R.

A82-20803 # **Visualization of flow separation and separated flows with the aid of hydrogen bubbles.** H. Bippes (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Institut für Experimentelle Strömungsmechanik, Göttingen, West Germany). In: International Symposium on Flow Visualization, Bochum, West Germany, September 9-12, 1980, Preprints of Contributed Papers. Bochum, West Germany, Ruhr-Universität Bochum, 1981, p. 225-230.

Experiments using the hydrogen bubble technique to investigate flow separation and separated flows on inclined wings and bodies are reported. The hydrogen-producing cathode was displaced until a location of interest can be found. The stability and the decay of trailing edge vortices shed from the tips of a rectangular wing at incidence was studied, and the flow was found to separate close to the point of maximum thickness. An axial velocity component was also observed, with a velocity close to the wing that was larger than the velocity of the oncoming flow. In a study of slender bodies the separation of the counter-rotating vortex pair became unstable, and at larger angles of incidence the lifting up of the vortex moved upstream, and another vortex layer separated downstream. On slender wings, the vortex breakdown manifested in a sudden burst. M.S.K.

A82-20811 # **Visualization of laminar separation by oil film method.** T. Ishihara, T. Kobayashi, and M. Iwanaga (Tokyo, University, Tokyo, Japan). In: International Symposium on Flow Visualization, Bochum, West Germany, September 9-12, 1980, Preprints of Contributed Papers. Bochum, West Germany, Ruhr-Universität Bochum, 1981, p. 304-308.

The effectiveness of using the oil film method for flow visualization was experimentally tested, with particular regard being given to the limited lines. A test cylinder was coated with light oil or machine oil adulterated with carbon powder and set in a transparent water channel at flows from 10-25 cm/sec. Photographs were taken, and a dye injection technique was used to repeat the same-tests. Two limited lines were observed in the oil flow patterns and in the dye injection, and were found to fluctuate simultaneously. The mean values of the limited lines were also observed to attain a constant value, but only after the passage of a certain period of time. M.S.K.

A82-20813 # **Flow field around an oscillating airfoil.** Y. Oshima (Ochanomizu University, Tokyo, Japan) and A. Natsume (Tokyo, University, Tokyo, Japan). In: International Symposium on Flow Visualization, Bochum, West Germany, September 9-12, 1980, Preprints of Contributed Papers. Bochum, West Germany, Ruhr-Universität Bochum, 1981, p. 315-319. 6 refs.

The wake pattern, the trailing edge flow, and the separated vortex at the leading edge of an oscillating airfoil are discussed, and observed flow patterns are compared with numerical predictions. A NACA 0012 airfoil was affixed to an acrylic plate and heaving and pitching motions were induced. The angle of attack was varied, the half-pitch angle was 10 deg, the oscillation period was 2-5 sec, and the speed of the cart carrying the test object through a tank of water yielded Re between 400-1200. Both the reduced frequency and the reduced heaving amplitude were calculated, and films were taken of each test. The flowfield near the trailing edge was made visible by means of electrolysis and aluminum dust methods. The separation point moved toward the front of the airfoil with increasing angle-of-attack. M.S.K.

DEVELOPMENT OF THE AUTOMATED AFAPL ENGINE SIMULATOR TEST FOR LUBRICANT EVALUATION Final Technical Report, 1 May 1978 - 1 Jan. 1981

B. B. Baber, M. L. Valtierra, and J. E. Eichelberger Wright-Patterson AFB, Ohio AFWAL May 1981 104 p refs
(Contract F33615-78-C-2012; AF Proj. 3048)
(AD-A106128; SWRI-MED-119; AFWAL-TR-81-2022) Avail: NTIS HC A06/MF A01 CSCL 14/2

A description of an automated gas turbine engine simulator, designated the AFAPL engine simulator, and a discussion of the test results obtained using the simulator are presented. The No. 4-5 bearing compartment areas of a J57 turbine engine are used as the basic hardware for the simulator. The simulator is driven by a variable-speed drive system, through the accessory drive gearbox, providing simulator mainshaft speeds up to 10,000 rpm. Electrical resistance heaters are used to heat the air surrounding the oil-wetted areas within the No. 4-5 bearing compartment areas. The temperatures, pressures, and rpm are automatically controlled at predetermined levels and monitored throughout the 9120-6000 rpm speed cycling sequences and the soakback periods by a Hewlett-Packard mini-computer system, which is also programmed to automatically draw 5-hr interval test-oil samples, control test-oil sump level, provide safety shut-off protection, as well as print out and plot test information generated during each individual test. Simulator results obtained on eight turbine engine lubricants, for which full-scale engine data are available, show a very good correlation of the deposit ratings obtained using the AFAPL engine simulator and the deposit ratings from full-scale engine tests. The purpose of this qualification operational test and evaluation (QOT and E) was to evaluate the ability of the F-16 20mm ALS to upload/download A-7D aircraft. Testing included uploading/downloading of 20mm ammunition on A-7D aircraft during normal day-to-day operations and during simulated combat conditions. A portion of the test was conducted with load crews wearing chemical warfare defense ensembles (CWDE). Specific Objectives are: Operational Effectiveness - to assess the capability of the F-16 ALS to upload/download ammunition into/from the A-7D aircraft; to assess the interoperability of the ALS with both the A-7D gun system and the modified replenisher, and to assess the capability of the modified replenisher to replenish the loader. Operational Suitability - Specific suitability objectives were not evaluated during this test. On site observations of some suitability areas (equipment failures, technical data, human factors, and chemical defense) were performed. GRA

FABRICATION OF BORON/ALUMINUM FAN BLADES FOR SCR ENGINES Final Report, Jun. 1976 - Jun. 1980

G. S. Doble Mar. 1981 49 p refs
(Contract NAS3-20360)

(NASA-CR-165294; ER-7891-F) Avail: NTIS HC A03/MF A01 CSCL 11D

The fabrication of boron/aluminum fan blades for the F-404 Supersonic Cruise Research prototype engine by rapid air bonding of fully dense monotapes is described, and the fan blades evaluated. The F-404 configuration is representative of a low aspect ratio advanced design blade with supersonic capability. Dovetail pull tests of this geometry, which substituted boron/aluminum for titanium, suggested that excessive shear stresses were present in the root. A re-designed blade, incorporating a titanium tang and root, was fabricated by hot isostatic pressing. Blades appeared well bonded but the airfoil contained sizable areas of deformation and identification from the alumina grain used as a pressure transmitting medium. The use of hot isostatic pressing with a formed steel encapsulator should eliminate this problem. J.D.H.

ENVIRONMENTAL EXPOSURE EFFECTS ON COMPOSITE MATERIALS FOR COMMERCIAL AIRCRAFT Interim Technical Report, Nov. 1977 - Jul. 1981
Martin N. Gibbins and Daniel J. Hoffman Washington NASA Jan. 1982 129 p refs
(Contract NAS1-15148)
(NASA-CR-3502; D6-51227) Avail: NTIS HC A07/MF A01 CSCL 11D

The effects of environmental exposure on composite materials are studied. The environments considered are representative of those experienced by commercial jet aircraft. Initial results have been compiled for the following material systems: T300/5208, T300/5209 and T300/934. Specimens were exposed on the exterior and interior of Boeing 737 airplanes of three airlines, and to continuous ground level exposure at four locations. In addition specimens were exposed in the laboratory to conditions such as: simulated ground-air-ground, weatherometer, and moisture. Residual strength results are presented for specimens exposed for up to two years at three ground level exposure locations and on airplanes from two airlines. Test results are also given for specimens exposed to the laboratory simulated environments. Test results indicate that short beam shear strength is sensitive to environmental exposure and dependent on the level of absorbed moisture. S.L.

ADVANCED RECORDER DESIGN AND DEVELOPMENT Final Report, Jun. 1977 - Feb. 1981
Carroll D. Thatcher Feb. 1981 192 p refs
(Contract DOT-HS-7-01640)
(PB81-244105; DOT-HS-805914) Avail: NTIS HC A09/MF A01 CSCL 13L

A prototype crash recorder measuring and storing time histories of vehicle lateral and longitudinal accelerations, during a collision was designed, fabricated, and subjected to environmental tests. The recorder features low cost accelerometers, signal conditioning circuitry, A/D converter, microprocessor and digital storage. Accelerometer outputs are continuously sampled and stored in digital memory. The microprocessor monitors Delta V and compares it to a selectable criterion. When Delta V exceeds the criterion recent acceleration time histories are permanently stored in memory. The stored signals include acceleration data prior to and subsequent to the crash event. Methods of implementing the recorder including discussion of distribution in vehicle fleets, data retrieval, including hardware and software, and data processing software are provided. DOE

NUMERICAL AND FLIGHT SIMULATOR TEST OF THE FLIGHT DETERIORATION CONCEPT Interim Report
John McCarthy and Vern Norviel Washington NASA Jan. 1982 37 p refs
(Contract NAS8-33458)
(NASA-CR-3500; M-370) Avail: NTIS HC A03/MF A01 CSCL 04B

Manned flight simulator response to theoretical wind shear profiles was studied in an effort to calibrate fixed-stick and pilot-in-the-loop numerical models of jet transport aircraft on approach to landing. Results of the study indicate that both fixed-stick and pilot-in-the-loop models overpredict the deleterious effects of aircraft approaches when compared to pilot performance in the manned simulator. Although the pilot-in-the-loop model does a better job than does the fixed-stick model, the study suggests that the pilot-in-the-loop model is suitable for use in meteorological predictions of adverse low-level wind shear along approach and departure courses to identify situations in which pilots may find difficulty. The model should not be used to predict the success or failure of a specific aircraft. It is suggested that the pilot model be used as part of a ground-based Doppler radar low-level wind shear detection and warning system. T.M.

MULTIPLE PURE TONE ELIMINATION STRUT ASSEMBLY Patent
Frank W. Burcham, inventor (to NASA) Issued 17 Nov. 1981 4 p Filed 11 Sep. 1980 Supersedes N80-32393 (18 - 23, p 3094)
(NASA-Case-FRC-11062-1; US-Patent-4,300,656; US-Patent-Appl-SN-185869; US-Patent-Class-181-214) Avail: US Patent and Trademark Office CSCL 20A

An acoustic noise elimination assembly is disclosed which has a capability for disrupting the continuity of fields of sound pressures forwardly projected from fans or rotors of a type commonly found in the fan or compressor first stage for air-breathing engines, when operating at tip speeds in the supersonic range. The assembly includes a tubular cowl defining a duct for delivering an air stream axially into the intake for a jet engine. A sound barrier, defined by a number of intersecting flat plates or struts has a line of intersection coincident with a longitudinal axis of the tubular cowl, which serves to disrupt the continuity of rotating fields of multiple pure tonal components of noise.

SINGLE STAGE TRANSONIC COMPRESSOR AND EQUIVALENT PLANE CASCADE
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 221-228 refs

Avail: NTIS HC A15/MF A01

The working group 12 activities cover primarily turbomachinery off design performance prediction, however include also blade to blade calculation on relevant test cases to get more information on those basic flow phenomena that affect flow losses and turning in blade rows. One of the test cases selected is the DFVLR single stage transonic compressor that was tested in great detail with the results well documented, particularly intrablade velocity data of the rotor are available from extensive flow studies with laser velocimetry. The data allow to compare blade to blade calculations to actual transonic compressor flow. Additionally to the rotor tests the rotor blade section at 45% span was investigated in the DFVLR transonic cascade windtunnel. L.F.

RESULTS OF CALCULATIONS
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 245-246 ref

Avail: NTIS HC A15/MF A01

The types of calculations were performed by various participants, each using his own method for through flow calculations and blade to blade calculations. The Working Group's task was to demonstrate that the use of systematic blade to blade calculations could provide a support for the confirmation of an existing correlation or the development of a new one. It is believed that the present development and state of the numerical tools available in order to compute complex flow structures, should be used more and more extensively in order to develop a deeper understanding of the flow mechanism of loss production and of turning. EVALUATION OF PROFILE LOSS PREDICTIONS BASED ON DIFFUSION FACTORS
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 269-280 refs

Avail: NTIS HC A15/MF A01

A comparison between theoretically predicted and measured profile losses was made, in order to evaluate the precision of the different prediction methods. These prediction methods are based on the relation between suction side diffusion and profile losses. The evaluation concerns as well the prediction of diffusion factor as predicted values of profile losses. It is further shown that these correlations are not universally valid for all blade shapes and that some correlations perform as well at design as at off design if the suction side diffusion is correctly predicted. BLADE-TO-BLADE COMPUTATIONS AND BOUNDARY LAYER CORRECTIONS IN AXIAL COMPRESSORS AND TURBINES
In its Through Flow Calculations in Axial Turbomachines Oct. 1981 p 307-326 refs

Avail: NTIS HC A15/MF A01

The number of inviscid calculation methods available today is quite impressive, and they allow an accurate prediction of inviscid incompressible, subsonic compressible and transonic flow. Recent progress has also resulted in a remarkable decrease of required computational effort, which makes them even more attractive to industrial applications. However, as these methods do not account for viscosity, the field of application is quite restricted, and good predictions can be obtained only for flow configurations where viscous effects can be neglected (e.g., turbines and low loaded compressor cascades). A similar conclusion can be drawn about boundary layer methods, with a limitation on shock boundary layer interaction, where complete solutions still require a large amount of computational effort. The combination of these two types of calculations started quite recently, and a lot of progress can be expected in the near future. Improvements which can be expected from a better combination of these two types of calculations will be more important than an improvement in the inviscid calculations. Based on the present state of the art concerning shock boundary layer interaction calculations, it appears that integral or inverse methods are the best suited to industrial calculations. However, in view of the considerable efforts currently made towards the development of the Navier-Stokes equation solution, it is more likely that, in the near future, this method will lead to more reasonable computation times and permit practical applications. HELICOPTER PROPULSION SYSTEMS: PAST, PRESENT AND FUTURE
Robert R. Lynn and Gordon E. Holbrook *In* AGARD Helicopter Propulsion Systems Sep. 1981 12 p refs

Avail: NTIS HC A13/MF A01

Helicopter propulsion systems are reviewed, and it is noted that helicopter development is paced to a major extent by the power plant. Power available, reliability, fuel consumption, power-to-weight ratio, and life cycle costs are key parameters. The application of emerging technologies such as microelectronics, ceramics and other new materials and approaches, and the continuing refinement of the aerodynamics and dynamics of gas turbine power plants are discussed and noted to result in a significant benefit to the helicopter and its operator. Important airframe-propulsion system interface requirements are given, and the need is discussed for new innovative certification procedures that provide for emergency operation with acceptable economics. Finally, future propulsion system capabilities are projected and their dramatic benefit for the helicopter noted. Author

DEVELOPMENT TEST PROGRAMS ADAPTED TO HELICOPTER ENGINES [PROGRAMMES D'ESSAIS DE DEVELOPMENT ADAPTES AUX MOTEURS D'HELICOPTERES]
J. Fresco *In* AGARD Helicopter Propulsion Systems Sep. 1981 9 p In FRENCH

Avail: NTIS HC A13/MF A01

The path to follow in a general program of engine development is shown with constraints of various kinds. There are regulatory requirements established by laws of navigability for civil aviation engines, and particular technical specifications for military aviation engines. Requirements of an operational order happen to be juxtaposed to precedents which are set by the different types of usages envisioned: flight profiles of various missions, and the environmental conditions likely to be encountered. This second factor is particularly important for a helicopter turbine because of the different utilizations and environmental conditions compared to a jet or turboprop engine. To address all these requirements, a test program must be built which, among others, takes into consideration this group of sometimes contradictory constraints in order to obtain certification and as well as to bring about development and operation without major risk. Specific tests for a helicopter turbine are examined with emphasis on the MAKILA program turbine which is on the AS-332 super PUMA. Transl. by A.R.H.

AIRCRAFT TURBINE ENGINE DEVELOPMENT: CURRENT PRACTICES AND NEW PRIORITIES
Charles C. Crawford, Jr. and William J. Crawford, III (GE, Lynn, Mass.) *In* AGARD Helicopter Propulsion Systems Sep. 1981 8 p
Avail: NTIS HC A13/MF A01

The T700 engine program was conducted during the 1970's and is representative of recent practices employed in the development of turboshaft engines for U.S. military application. The engine, which is in the 1,600 horsepower class, recently entered service in the twin engine U.S. Army UH-60A Black Hawk helicopter. The T700's field introduction follows an extensive program of technology demonstration, development, qualification and maturity. Requirements applied in the T700 program and associated benefits, challenges and penalties are surveyed. Suggested improvements for future programs are offered, and technology needs revealed during T700 development are identified. Post-qualification maturity testing, which was conducted to provide early exposure of high time failure modes, is described. Program features which are important for development costs payback are summarized. J.D.H.

MECHANICAL ADVANCES IN THE DESIGN OF SMALL TURBOSHAFT ENGINES
J. Dominy and K. J. Hart *In* AGARD Helicopter Propulsion Systems Sep. 1981 12 p

Avail: NTIS HC A13/MF A01

Mechanical components have a significant influence on the efficiency of a small gas turbine engine. Some of the performance losses associated with the design of the power transmission and internal air system are defined and discussed. Improvements in engine efficiency must be considered in conjunction with cost, reliability and size or weight. Many of the problems considered are applicable to gas turbines in general but become acute in small engines due to the adverse effects of scale on many components design parameters. To meet the increasing demand for more efficient powerplants the mechanical research engineer must improve the analysis of mechanical component behavior to produce optimized engine designs. Author

REGENERATIVE HELICOPTER ENGINES: ADVANCES IN PERFORMANCE AND EXPECTED DEVELOPMENT PROBLEMS
H. Grieb and W. Kluesmann *In* AGARD Helicopter Propulsion Systems Sep. 1981 12 p ref Sponsored by Ministry of Defence of the Federal Republic of Germany

Avail: NTIS HC A13/MF A01

On the basis of modern engine component technology, including and emphasizing recent progress in high temperature heat exchanger technology, a conventional and a regenerative helicopter engine in the 900 kW power class are compared in design, performance and life cycle costs. The comparison shows that the installation properties of the two engines are roughly the same. The variable power turbine, being an indispensable part of a regenerative engine, leads to an extremely favorable transient behaviour with a moderate influence of severe cyclic loading on hot-part lifetime. No significant difference exists in

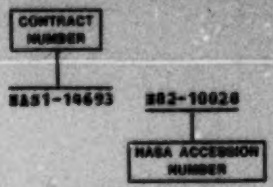
CONTRACT NUMBER INDEX

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

small general aviation aircraft, chartered jets, or scheduled air services. M.S.K.

A82-19003 **Survey of aeromedical evacuation in Italy.** C. Manni (Roma, Università Cattolica, Rome, Italy) and G. Ruggieri. In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 73-75. 6 refs.

Aeromedical rescue efforts in Italy, primarily performed by the Italian Air Force, are outlined. Air rescue is mainly confined to remote locations or small islands, and follows the identification by county authorities of the level of the request, the availability of beds in the nearest hospital, and the ensurance of ground transport from the nearest airfield. The Air Force is responsible for providing personnel and machines, including fixed wing aircraft or helicopters, and readiness requirements are detailed. It is noted that the overlapping of various jurisdictional regions by armed forces, state corps, and governing bodies sometimes results in a redundancy of services arriving for the same rescue mission. The training of Air Force aeromedical personnel for first aid and resuscitation tasks is discussed, and can comprise basic medical actions which justify the cost of airborne rescue. M.S.K.

A82-19004 **The network of civilian air rescue in Germany (Das Netz der zivilen Luftrettung in Deutschland).** G. Kugler (Allgemeiner Deutscher Automobil-Club, Munich, West Germany). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 76-79. In German.

For the last 10 years a network of 26 helicopter air rescue stations have been in operation in West Germany, which can reach 80% of the population within 15 minutes. This civilian air rescue system is used to transport physicians to the scene of an accident, transport patients to hospitals or specialized clinics, transport organs, medical equipment or blood, and act as a search vehicle over mountainous land. Since the beginning of the program, 88,000 rescue flights have been completed, with a maximum daily frequency of 15 flights. In addition to the helicopter rescue program, West Germany has an ambulance aircraft service that specializes in flying patients from outlying areas to suitable clinics in the interior of the country for treatment. D.L.G.

A82-19005 **Ambulance helicopter in the Stockholm archipelago.** B. Brismar (Huddinge University Hospital, Huddinge, Sweden) and A. Alveryd. In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 85-87.

The results of a summer trial program for aeromedical relief of persons in the Swedish archipelago are reported. A Bell 206 helicopter provided room for a pilot, a prone passenger, and a seated passenger. Noting that in no instance was more than one patient transported at a time, the response time from call receipt to chopper arrival was an average of 25 min, and was extended only when the helicopter was otherwise occupied with another call or during night and bad weather conditions. The lack of an on-site, suitable helicopter landing pad at some hospitals forced a transfer of 85% of the patients by surface ambulance to a hospital in other locations. The cost of the helicopter service was about four times the cost of calling an ambulance in Stockholm, and it was found that in only 16% of the calls was a trained physician necessary, with most cases amenable to treatment by a nurse or other paramedic. M.S.K.

A82-19006 **Military assistance to safety and traffic /MAST/.** W. R. Gemma (U.S. Department of Health and Human Services, Office of International Health Affairs, Rockville, MD). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 90-94.

The lessons learned and the organizational scheme for the U.S. Military Assistance to Safety and Traffic (MAST) Program are examined. A six-month evaluation of five demonstration sites showed that the use of military personnel and equipment, including helicopters, for emergency medical services is feasible, the military provides round-the-clock readiness, while communities must actively seek to utilize the sources available, and some resistance to MAST use was encountered with local law enforcement agencies. The performance of MAST missions was found to serve as training and mandatory flight time for military personnel, and was employed by civilians only when the available civilian aeromedical services were considered inadequate. Problems of communications involved providing civilian coordinating teams with units compatible with military communications. M.S.K.

A82-19007 **Aerial ambulance service in Australia.** S. Rowley (Sydney Helicopter Rescue Service, Sydney, Australia). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 94-99.

The operations of the Royal Doctor Flying Service of Australia, which provides medical services for persons living in the remote regions of the Outback, are described. All the doctors are pilots, and also run daily two-way radio clinics, fly rounds for immunization programs, and accompany emergency aeromedical evacuation teams to transfer seriously ill or injured persons to medical facilities. Surf rescue and other coastal aeromedical functions are enacted by helicopter services, which feature a crew comprising a pilot, a rescue crewman, and a doctor. The services are available to everyone, and no charge is levied on anyone or any community for the services rendered. M.S.K.

A82-19008 **Flying doctor service in East Africa.** A. M. Wood (Flying Doctor Service of Africa, Nairobi, Kenya). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 100-103.

The various features of the East Africe Flying Doctor Service are outlined. The service comprises eight aircraft and a radio network of 100 stations, with calls averaging 2200/mo. Over 100 airstrips are provided near medical facilities, and the flying doctor performs a routine six-month circuit, with the emergency calls occurring at any time. Treatment is confined to dealing with the patient on-site wherever possible, due to overcrowded hospitals, the patient's familiarity and tasks at home, and the opportunity to treat other persons while on the visit. A complete operating team travels on each trip, and also a pilot who is frequently from the region and has a commercial pilots' rating. It is noted that the aircraft method provides a service where otherwise there would be none at all. M.S.K.

A82-19009 **Air ambulance systems in the Republic of South Africa.** G. O. F. Lippert. In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 104-107.

The operations of the three air ambulance systems in South Africa are discussed. The Johannesburg district has the only helicopter ambulance service, and services an area 500 km in radius. A three minute interval exists between call arrival and dispatch with a full medical team on board. The commercial helicopter firms in Cape Town also offer a 300 km radius air ambulance service, while other population centers have fixed-wing services with either voluntary or Red Cross personnel as the medical teams. Military air ambulances are reserved for particular rescue missions, and it is noted that emergency notification is usually accomplished by telephone. M.S.K.

A82-19010 **The situation of air rescue in Argentina (Die Situation der Luftrettung in Argentinien).** K. Liebig (Rappard y Cia, S.A., Buenos Aires, Argentina). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 108-110. In German.

Due to the geography of Argentina, air rescue is often the only possible mode of rescue. In case of land catastrophes such as earthquakes, the army will be used to evacuate the elderly, the children and the injured from the area, and fly in medical aid and foodstuffs. Helicopters are often used by the police to rescue people from tall buildings, and water emergencies are taken care of by a special branch of the police who are in charge of the rivers and coasts in the region. Their duties include rescue operations in case of flooding, usually using helicopters. In 1979, the four helicopters in the program flew 320 hours and aided 355 people. D.L.G.

A82-19011 **Aeromedical evacuation in New Zealand.** R. J. Worth. In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports.
Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 120-122.

The operations and integration of military, government, and private air ambulance services in New Zealand are explored. Only one commercial air ambulance helicopter service exists, which logged 40 missions in its first year of operations carrying premature babies, pregnant mothers, burns victims, trauma victims, and patients with head injuries. The helicopter is used for commercial purposes until called on to make a medical emergency call, when a medical supplies unit can be mounted on-board in four minutes. The role of the U.S. Air Force in carrying out rescue missions in Antarctica from the base at Christchurch is reviewed, and a recommendation is made for a central command to coordinate the activities of the U.S. Air Force, the New Zealand Air Force, and the private aeromedical services. M.S.K.

A82-19013 **A comparative study on mechanical vibration and noise during patient transportation.** S. Rowley (Sydney Helicopter Rescue Service, Sydney, Australia). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 175-177. 5 refs.

The magnitude of mechanical vibration and noise has been investigated for three different forms of patient transportation: helicopters, fixed-wing aircraft, and road vehicles. The figures obtained for all forms of patient transportation studied are below the level set by international standards, but no conclusive evidence of adverse effects on injured tissue is yet available. It is noted that in the case of the helicopter, where the vibration frequencies (6.5, 13, and 19 Hz) are constant during the entire flight, some components are located in the resonance frequency spectrum of some body organs. It is, however, possible to reduce the magnitude of these critical frequencies more readily than to suppress not only the very low frequencies, but also the displacement of the body occurring both in the fixed-wing aircraft and in the road vehicle. V.L.

A82-19015 **Helicopter secondary applications for neurotraumatic emergencies (Helikopter-Sekundäreinsätze für neurotraumatologische Notfälle).** L. M. Auer (Universitätsklinik für Neurochirurgie, Graz, Austria). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports.
Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 184-186. In German.

Since the life of patients can depend on minutes in neurological cases, the fastest possible transportation of trained neurological surgeons is very important. Since many mountainous regions in Austria are hours away by car from clinics where patients can receive proper neurological care, a program was developed whereby helicopters can transport neurosurgeons to the patients often within minutes. The system allows the patient to be operated on immediately without being moved, and afterwards the patient can either be flown to a neurological clinic or remain in the original hospital for post-operative care. Results of the program have been good; in 1973-1974 before the program, only 25% of neurotraumatic patients survived, while in 1977-1979 after the application of the program, 58% of the patients survived. D.L.G.

A82-19017 **Helicopters - Night operations (Hubschrauber - Einsätze bei Nacht).** C. Bühler (Schweizerische Rettungsflugwacht, Zurich, Switzerland). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports.
Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 214-216. In German.

In Switzerland the helicopter is often used to transport accident patients from the south to the university clinics in the north. Pilots are required to make three types of flights: return flights to the homebase, flights to familiar destinations such as hospitals, and flights to unfamiliar destinations such as where first aid is administered. Weather is critical, and bad weather can create delays and additional risk. Accessories are used to improve flying, including obstacle maps, altimeters, night viewing goggles, and projector lamps, and electronic equipment may be used in the future to improve vision. D.L.G.

A82-19018 **Problems pertaining to aeronautical technology in the case of rescue operations with helicopters in mountainous areas (Flugtechnische Probleme beim Bergrettungseinsatz mit Hubschraubern).** B. Klingner (Bundeswehr, Penzing über Landsberg, West Germany). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports.
Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 219-222. In German.

The use of helicopters for rescue operations in mountainous areas can provide sometimes very great advantages compared to an employment of more conventional means. However, the conditions might be such that a use of helicopters, although urgently needed, is not possible in connection with technological and environmental factors. An investigation is conducted regarding the criteria which have to be taken into account in an evaluation concerning the feasibility of an employment of a helicopter in a specific situation, giving attention to limitations with respect to machines and pilots. Aspects of engine performance are considered along with the helicopter payload, the weather, and a special training of helicopter pilots for flight operations in mountainous areas. G.R.

A82-19019 **The helicopter in rescue operations in high-mountain areas (Der Hubschrauber beim Rettungsdienst im Hochgebirge).** W. Phleps and G. Flora (Innsbruck, Chirurgische Universitätsklinik, Innsbruck, Austria). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports.
Munich, Allgemeiner Deutscher Automobil-Club, 1981, p. 222-229. In German.

The use of helicopters for rescue operations in high-mountain areas is briefly reviewed. It is pointed out that in a number of cases the employment of a helicopter represents the only possibility to effect a rescue. It is estimated that, taking into account only the Alps, considerably more than 100 persons owe their rescue from certain death each year exclusively to the availability of a helicopter. The decision regarding an employment of a helicopter in an area of high mountains is based on three criteria, which are related to the medical aspects involved, considerations regarding the general feasibility of rescue operations, and economic factors. Differences regarding the characteristics of helicopter operations in mountainous areas and in flat country are discussed, and a description is provided of the advantages and drawbacks of the five helicopter types which are most frequently employed in the Alps. G.R.

A82-19020 **Design requirements for modern rescue helicopters (Konstruktive Anforderungen an moderne Rettungshubschrauber /RTH/).** E. Weiland (Messerschmitt-Bölkow-Blohm GmbH, Unternehmensbereich Drehflüger und Verkehr, Munich, West Germany). In: Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports.
Munich, Allgemeiner Deutscher Automobile-Club, 1981, p. 418-436. In German.

The architecture and size of a rescue helicopter is determined by its function as well as the time and space required to successfully complete its mission. A matrix is presented which outlines the various technical requirements of a rescue helicopter and the corresponding design solutions. The resulting architecture includes a helicopter airframe with a large interior cabin for transporting and caring for the sick or injured; a wide door to facilitate loading; a main rotor with at least three blades; a rotor arrangement that vol. 19, Jan.-Feb. 1982, p. 86, 87. 7 refs. Research sponsored by the Indian Space Research Organization.

Wind tunnel roll damping data on the Basic Finner are presented for subsonic speeds up to Mach 3. Rolling moment coefficients were obtained with a 5% accuracy in the transonic regime and to within 3% at supersonic speeds. A drop in roll damping in the transonic region is attributed to the occurrence of a shock wave on the fin causing a drop in fin lift. The measured roll rate coefficient was found to be invariant with the roll rate at all Mach speeds at zero angle of incidence, in contrast to previous tests in which the roll rate constant remained invariant with the rate only in supersonic regimes. M.S.K.

A82-19966 # **Fuel property effects on radiation intensities in a gas turbine combustor.** J. A. Clark (Ohio State University, Columbus, OH). *AIAA Journal*, vol. 20, Feb. 1982, p. 274-281. 20 refs.

The effect of fuel properties on primary zone radiation intensities in gas turbine combustors is examined. This study concludes that there is a strong empirical relationship between the primary zone radiation intensity and two fuel properties - percent hydrogen and percent polycyclic aromaticity. These two properties are combined in a single parameter called 'effective hydrogen content,' which is then used to correlate radiation intensities from seven different fuels burning under a variety of operating conditions. The explanation for the empirical relationship is that effective hydrogen content is a measure of the soot-forming tendency of a fuel. (Author)

A82-19970 **Ground reflection effects in aircraft noise measurements (Bodenreflexionseffekte bei Fluglärmessungen).** W. M. Dobrzynski (Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Abteilung Technische Akustik, Braunschweig, West Germany). *Zeitschrift für Flugwissenschaften und Weltraumforschung*, vol. 5, Nov.-Dec. 1981, p. 367-374. 6 refs. In German.

Aircraft noise measurements were carried out for the certification of propeller aircraft (weighing no more than 5.7 tons), and the maximum A-weighted flyover noise level was determined as a coefficient of measure. Since the flyover signal is known to be affected by ground reflection interference experimental and theoretical methods were used to determine the extent to which these effects can also change the maximum A-weighted flyover noise level. Measurements were made by microphones on several aircraft at 1.2 m in altitude; a second microphone was placed on the ground as a reference. Calculations and measurement results show that, depending on the propeller rotational speed and blade number, level differences of up to 3 dB(A) can be obtained between unaffected signals plus signals affected by reflection interference. J.F.

A82-20054 **Ultrasonic method for flow field measurement in wind tunnel tests.** R. H. Engler, D. W. Schmidt, W. J. Wagner, and B. Weitemeier (Max-Planck-Institut für Strömungsforschung; Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, Göttingen, West Germany). *Acoustical Society of America, Journal*, vol. 71, Jan. 1982, p. 42-50. 14 refs.

An ultrasonic measuring system suitable for rapid and nondisturbing measurements of the flowfield around models in wind tunnels is presented. The shift in two sound beams propagating parallel to one another when crossing a vortex is modeled, and the velocity field traversed is defined. The running times of the sound beams are used to determine the circulation of the vortex under test directly from a derived curve. Condensor microphones emit the sound pulses, which are received by similar apparatus for processing by computer. Examples are provided for a single vortex, for the influence of a spoiler, and for tip vortices behind an oscillating blade. Future developments in the system which include using an array of up to 18 ultrasonic microphones to eliminate mechanical shifting of the model are indicated. M.S.K.

A82-20058 **Comparison of aircraft and ground vehicle noise levels in front and backyards of residences.** J. C. Ortega (Paul S. Veneklasen and Associates, Santa Monica, CA) and K. D. Kryter (SRI International, Menlo Park, CA). *Acoustical Society of America, Journal*, vol. 71, Jan. 1982, p. 216, 217.

Measurements and measurement techniques for comparing front and backyard noise levels for aircraft and surface vehicle noises are presented. Microphones in the front and back of a house were used to gather sounds from aircraft taking off, a manual shift small vehicle pulling in and out of the driveway, and a garbage collection truck making its rounds past the front of the house. Two residences were monitored, and the tapes were analyzed for maximum A-weighted noise levels. The reduction for surface vehicle noise traveling from front-to-back of the house ranged from 17-21 dBA, while no significant difference was found for the aircraft noise. M.S.K.

A82-20128 **Design of the composite spar-wingskin joint.** R. D. Cope and R. B. Pipes (Delaware, University, Newark, DE). *Composites*, vol. 13, Jan. 1982, p. 47-53. Contract No. F33615-77-C-3132.

A variety of composite spar-wingskin joint concepts have been investigated to optimize out-of-plane strength while still providing low weight and ease of fabrication. The spar-wingskin configuration consists of a thin spar which overlaps and is co-cured perpendicular to a thick wingskin. Investigation parameters were the joint geometry in the immediate vicinity of the base of the spar, and the spar-to-spar spacing. It was found that by varying the overlap geometry and decreasing the interspar spacing a significant increase in out-of-plane strength could be realized. A theoretical analysis was made by the extended use of the finite element technique. Joint strength was predicted through the application of Tsai-Wu, maximum stress and maximum shear failure criteria. These results were verified by comparison to experimental results in which all significant concepts were fabricated and tested. (Author)

A82-20137 **The prospects for liquid hydrogen fueled aircraft.** G. D. Brewer (Lockheed-California Co., Burbank, CA). *International Journal of Hydrogen Energy*, vol. 7, no. 1, 1982, p. 21-41. 12 refs.

It is pointed out that an alternative fuel for transport aircraft must be either producible or available anywhere in the world. It is contended that this requirement can be met by liquid hydrogen because it can be produced from water using any locally available energy source. It is not dependent on the availability of fossil resources. With conventional production technologies, LH2 may cost more per unit energy than hydrocarbon alternatives. Because of the weight advantage, however, aircraft using LH2 will be more efficient and their direct operating costs will be competitive. It is shown that, with advanced technologies, LH2 can provide cost and energy advantages. A plan to develop LH2 technology on an international basis is proposed. C.R.

A82-20172 **New life for an 'old' body - Vienna's master plan for revitalization.** R. Schano. *Airport Forum*, vol. 11, June 1981, p. 27, 28, 30, 32.

Details of a new master plan for the Vienna airport are presented, noting the departure from a piece-by-piece add-on system to meet new demands. The plan was developed to anticipate the needs and services for an increase of one million passengers/yr every five years until the year 2000. A decision was reached to expand the existing terminal, making more efficient use of available space. The two legs of the V-shaped runways will be extended and equipped for Cat 3, all-weather conditions, sufficient for the 230,000 projected aircraft movements which prodded the expansion. The phased improvements will be undertaken while the airport continues normal operations, and will at some point involve ferrying passengers to parked aircraft by wide-bodied buses. A doubling of the ramp area is also planned. M.S.K.

A82-20221 **Movement in Category III conditions.** P. J. Hunt (British Airways, Hounslow, Middx., England). *Aircraft Engineering*, vol. 53, Dec. 1981, p. 14-17.

All-weather operations are defined and discussed for the London Heathrow Airport. The decision height and the runway visual range are the critical parameters for choosing the operational conditions and the category. To make a landing with 100 m visibility and a decision height of 10-20 ft, a fully automatic landing system is required and must operate fully linked with an ILS localizer on the ground. Traffic is cleared of the sensitive landing corridor to maintain clean signals to the incoming craft just before touchdown.

The distance at Heathrow is set at 135 m, and it is noted that the procedures reduce the rate of arrivals by only one/hour. A surface radar is employed to maintain surveillance over ground traffic and control the patterns, mainly through a controllable taxiway centerline, stop-bar lights, and a flashing red Category 2/3 holding point marker. M.S.K.

A82-20222 **Ground movement control and guidance - Cat. 3 operations experience in Air Inter.** Mr. Roland-Billecart (Air Inter, Paray-Vieille-Poste, Essonne, France). *Aircraft Engineering*, vol. 53, Dec. 1981, p. 17-19.

A82-20266 **Pressure dependence of jet noise and silencing of blow-offs.** D.-Y. Maa and P.-Z. Li (Chinese Academy of Sciences, Acoustics Institute, Beijing, People's Republic of China). *Noise Control Engineering*, vol. 17, Nov.-Dec. 1981, p. 104-112. 13 refs.

Improvements in methods of jet noise prediction and reduction are discussed. Measurements were performed on a cold-air jet exiting through convergent nozzles of varying diameters, and on superheated jet streams at an oil refinery. A critical value was determined for the stagnation pressure, beyond which the jet becomes choked and shock-cell noise occurs along with turbulent noise. The turbulent noise was isolated by making the lip of the jet irregular, then measuring the A-weighted sound level. Blow-down studies were also made of the shock-cell noise, which was found to happen above the frequency peak of the turbulent noise. The interaction of microjets grouped together is considered, noting that a form of the Coanda effect causes the formation of a single jet. A micropore muffler is presented, which consists of a pipe drilled with many holes, and a diffuse-muffler is mentioned, which contains randomly distributed holes internally to dampen the noise emission. M.S.K.

A82-20276 **Computer graphics for quality assurance.** V. W. Gott (Northrop Corp., Aircraft Div., Hawthorne, CA). *IEEE Computer Graphics and Applications*, vol. 2, Jan. 1982, p. 39-41, 43, 44.

The use of CAD/CAM for quality assurance at Northrop is examined. The use of on-line and library computer graphics systems by the quality assurance personnel enabled the programming of lofting for at-will retrieval. The data is used to inspect master tools check features, castings, forgings, parts with basic moldline features, drawings, and tool design drawings. Lofting requests are made if the files are found to have inadequacies, and quality assurance findings are returned to the requester in hard copy form. Continuous updating of the system is reviewed, and the relevant data for cataloguing and identifying parts and parts surfaces are outlined. A reduction of time spent in inspections of 400% has been achieved with the system. M.S.K.

A82-20277 **Graphics in numerical control - The user's challenge.** J. H. Mabry (Rockwell International Corp., Tulsa, OK). *IEEE Computer Graphics and Applications*, vol. 2, Jan. 1982, p. 45-49.

The use of computer graphics to develop numerical control programs for the aerospace industry, particularly for parts for the Boeing 757, is explored. The user's understanding of the command structure of the graphics system was found to be the critical element in increasing productivity with the CAD/CAM systems. Other productivity gains were obtained by programming commonalities, reviewing the processing requirements to identify the command stream, elimination of operator response where possible, and menu or software revision early in the task. M.S.K.

A82-20278 **The future of integrated CAD/CAM systems - The Boeing perspective.** W. Beeby (Boeing Commercial Airplane Co., Engineering Div., Seattle, WA). *IEEE Computer Graphics and Applications*, vol. 2, Jan. 1982, p. 51, 52, 54-56.

The operations and upgrading of the interactive CAD/CAM system at Boeing for the design and manufacture of aircraft are discussed. The introduction of the system allowed engineering drawings to be used by manufacturing personnel without necessitating face-to-face contact, and the inclusion of lofting diagrams permitted the designers and builders to talk through the system to define changes. An upgrading to three-dimensional representation to enhance the engineering and manufacturing sections of the system is outlined, with stress upon the use of a shared data base. Critical areas of the system are listed as data management, which delineates the product definition data and planning and control data; a geometry engine for manipulating and evaluating the image data; and the communications processing network, which facilitates the rapid transfer of data between any discipline in the plant. M.S.K.

A82-20291 * # **Dilution jet behavior in the turn section of a reverse flow combustor.** S. M. Riddlebaugh (NASA, Lewis Research Center, Cleveland, OH), I. Greber (Case Western Reserve University, Cleveland, OH), and A. Lipshitz. *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0192.* 13 p.

Measurements of the temperature field produced by a single jet and a row of dilution jets issued into a reverse flow combustor are presented. The temperature measurements are presented in the form of consecutive normalized temperature profiles, and jet trajectories. Single jet trajectories were swept toward the inner wall of the turn, whether injection was from the inner or outer wall. This behavior is explained by the radially inward velocity component necessary to support irrotational flow through the turn. Comparison between experimental results and model calculations showed poor agreement due to the model's not including the radial velocity component. A widely spaced row of jets produced trajectories similar to single jets at similar test conditions, but as spacing ratio was reduced, penetration was reduced to the point where the dilution jet flow attached to the wall. (Author)

A82-20293 * # **An experimental study of separated flow on a finite wing.** A. E. Winkelmann (Maryland, University, College Park, MD). *American Institute of Aeronautics and Astronautics, Atmospheric Flight Mechanics Conference, Albuquerque, NM, Aug. 19-21, 1981, Paper 81-1882.* 21 p. 9 refs. Grant No. NsG-1570.

The flow field associated with the formation of a mushroom shaped trailing edge stall cell on a low-aspect-ratio (AR = 4.0) wing was investigated in a series of low speed wind tunnel tests (Reynolds number based on 15.2 cm chord = 480,000). Flow field surveys of the separation bubble and wake of a partially stalled and fully stalled wing were completed using a hot-wire probe, a split-film probe, and a directional sensitive pressure probe. A new color video display technique was developed to display the flow field survey data. Photographs were obtained of surface oil flow patterns and smoke flow visualization. (Author)

A82-20294 # **Digital avionics - Advances in maintenance designs.** D. W. Mineck (Rockwell International Corp., Collins Air Transport Div., Cedar Rapids, IA). In: Digital Avionics Systems Conference, 4th, St. Louis, MO, November 17-19, 1981, Collection of Technical Papers. Conference sponsored by the American Institute of Aeronautics and Astronautics and Institute of Electrical and Electronics Engineers. New York, American Institute of Aeronautics and Astronautics, 1981. 11 p. (AIAA 81-2240)

It is shown that the performance benefits of advanced digital avionics systems can only be realized through the refinement of maintenance techniques. Digital technology permits the cost-effective application of line replaceable unit (LRU) level testing, centralized avionics system monitoring, and fault isolation. It is expected that maintenance designs under development will further reduce costs, and ensure that performance benefits are consistently achieved through high availability. Automatic and interactive ground testing can be realized through the application of maintenance oriented ground rules throughout avionics systems' design and development process, including on-aircraft maintenance of in-flight fault storage and in-flight fault consolidation. In this way, carry-on equipment will be virtually eliminated. O.C.

A82-20296 * # **Piloted simulation of an on-board trajectory optimization algorithm.** D. B. Price (NASA, Langley Research Center, Hampton, VA), A. J. Calise, and D. D. Moerder (Drexel University, Philadelphia, PA). *AIChE, ASME, IEEE, and ISA, Joint Automatic Control Conference, University of Virginia, Charlottesville, VA, June 17-19, 1981, Paper.* 28 p.

This paper will describe a real time piloted simulation of algorithms designed for on-board computation of time-optimal intercept trajectories for an F-8 aircraft. The algorithms, which were derived using singular perturbation theory, generate commands that are displayed to the pilot on flight director needles on the 8-ball. By

A82-20874 * # **Advanced subsonic transport propulsion.** D. L. Nored, C. C. Ciepluch, R. Chamberlin, E. T. Meleason, and G. A. Kraft (NASA, Lewis Research Center, Cleveland, OH). *AIAA, SAE, ASCE, ATRIF, and TRB, International Air Transportation Conference, Atlantic City, NJ, May 26-28, 1981, AIAA Paper 81-0811.* 30 p. 5 refs.

Examination of future subsonic commercial aircraft propulsion trends begins with a brief review of the current NASA Energy Efficient Engine (E3) Project. Included in this review are the factors that influenced the design of these turbofan engines and the advanced technology incorporated in them to reduce fuel consumption and improve environmental characteristics. In addition, factors such as the continuing spiral in fuel cost, that could influence future aircraft propulsion systems beyond those represented by the E3 engines, are also discussed. Advanced technologies that will address these influencing factors and provide viable future propulsion systems are described. And finally, the potential importance of other propulsion system types, such as geared fans and turboshaft engines, is presented. (Author)

A82-20981 **Bolted field repair of graphite/epoxy wing skin laminates.** R. E. Bohlmann, G. D. Renieri (McDonnell Aircraft Co., St. Louis, MO), and M. Libeskind (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Joining of composite materials; Proceedings of the Symposium, Minneapolis, MN, April 16, 1980. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 97-116. Contract No. N62269-78-C-0272.

Mechanically fastened field repair techniques have been developed for graphite/epoxy skins damaged at or near substructure members and used to repair AV-8B and F-18 wing skin laminates. Damages of up to 101.6 mm in diameter have been repaired by mechanically fastening a titanium patch to the laminate using blind fasteners in single shear, with access only to the outside surface. The design goal of 0.004 mm/mm for a repaired graphite/epoxy wing skin laminate was attained for static strength and for residual strength tests after four lifetimes of spectrum fatigue. V.L.

A82-20982 **Improving composite bolted joint efficiency by laminate tailoring.** J. R. Eisenmann and J. L. Leonhardt (General Dynamics Corp., Fort Worth, TX). In: Joining of composite materials; Proceedings of the Symposium, Minneapolis, MN, April 16, 1980. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 117-130.

An approach to laminate tailoring is presented which makes it possible to uncouple the local bearing capacity from the influence of the laminate axial strain level in a composite bolted joint. This is achieved by partitioning the laminate into two distinct regions: the primary region, which contains a high percentage of 0-deg plies and thus carries a high percentage of the overall axial load, and the bearing region, which contains no 0-deg plies and thus carries only a small portion of the overall axial load. As a result, the bearing region is insensitive to the amount of axial load in the joint and can continue to serve the function of introducing the bolt loads in the laminate even at high axial strains. In validation tests, a 24% increase in weight efficiency and a 60-70% increase in axial strain level were typically obtained when the tailored joint concept was adopted in place of the conventional approach. V.L.

A82-21189 **Airbus Industrie - The year of progress.** K. Regelin. *Interavia,* vol. 37, Jan. 1982, p. 35-39.

At the end of March 1982, the first A310 will take off from Airbus Industrie's Toulouse base. The completion of a one-year flight test program is expected to lead to full certification of the aircraft for airline operations by Mar. 31, 1983. Airbus Industrie claims to have developed the most advanced airliner wing. Compared with the already efficient wing of the A300, the span of the smaller A310 is only 2% shorter. However, the wing area has been reduced by approximately 16%. The resulting higher aspect ratio improves aerodynamic efficiency, while the increased thickness-to-chord ratio reduces weight. Attention is given to the aircraft design, the two-man versus three-man crew issue, the electronic flight instrumentation, the digital Automatic Flight System, the aircraft production plan, design details regarding the three slat sections on each wing, and Airbus Industrie's confidence in further market growth. G.R.

A82-21190 **Boeing's bigger narrowbody.** B. Rek. *Interavia,* vol. 37, Jan. 1982, p. 43-46.

After the termination of 707 production, the biggest production airliner remaining with the classic Boeing six-abreast fuselage is the 180/200-seat 757 twinjet. The first flight of the 757 is scheduled for Feb. 26, 1982. Two engines are currently being considered for use with the 757. Improved technology coupled with a rigorous weight reduction program has made possible significant improvements in fuel efficiency. It is planned to offer a 240,000 lb gross-weight version of the 757 which will be capable of U.S. coast-to-coast range. The single-aisle 757 is regarded as part of a larger program which includes the 767 as well. The 'configuration cab' contains flight deck features which will be common to the 757 and 767. Other common features include the Flight Management System, the Thrust Management Computer, and the Inertial Reference System. Attention is also given to the test program and the 757 market prospects. G.R.

A82-21191 **A new look at the Tupolev Tu-26 'Backfire'.** G. Lafon. *Interavia,* vol. 37, Jan. 1982, p. 78, 79.

The Soviet Air Force has now four types of aircraft with variable-sweep wings in service, including the Sukhoi Su-17/20/22 Fitter and MiG-23/27 Flogger fighters, the Su-24 Fencer strike aircraft, and the Tu-26 Backfire bomber. The characteristics of the Backfire bomber are compared with those of an equivalent design with fixed wings. It is pointed out that the 55 deg swept wing, with a leading edge which goes sonic at Mach 1.75, is not sufficiently swept for supersonic cruising. High sweep must be intended primarily for transonic/supersonic dash. The powerplant is believed to include two reheated Kuznetsov turbofans, as used in the Tu-144 supersonic transport (SST). It is estimated that with an SST powerplant Backfire will be capable to fly at speeds of about Mach 0.85 at sea level, Mach 1.2 at 20,000 ft, and Mach 1.7 at 40,000 ft. Aspects of subsonic performance are also discussed, taking into account a comparison with the U.S. B-1. G.R.

A82-21243 **ALF502 - Plugging the turbofan gap.** R. Whitaker. *Flight International,* vol. 121, Jan. 30, 1982, p. 237-241.

The development history, mechanical design and performance capabilities of the ALF502 turbofan engine are presented. The high-bypass design is based on the T55 turboshaft engine's core, yields low noise and low fuel consumption, and achieves good maintainability by means of a modular construction that comprises separate fan, accessory gearbox, gas producer, and combustor turbine elements. Only three special tools are needed for module changes, and an initial mean time between overhauls of 4000 hours is estimated. Because of the moderate temperatures and pressures for which the engine is designed, it is expected to meet the ICAO's 1983 emission regulations with respect to smoke, CO, hydrocarbons and nitrogen oxides. The engine has been selected for use in the Challenger business aircraft, and is presently employed in the BAe 146. O.C.

A82-21260 **AV-8B Harrier II.** R. Braybrook. *Air International,* vol. 22, Feb. 1982, p. 64-69, 102.

Design improvements, operating characteristics, and performance data of the AV-8B Harrier II V/STOL aircraft are discussed. The Harrier is a joint U.S.-UK development for use by the navies and by the USMC, who have added new combat maneuvers to take advantage of the engine nozzle deflectors for low speed maneuverability. The wing area has been extended to 230 sq ft from the AV-8A 201 sq ft, and the aircraft now has single slotted flaps, a supercritical airfoil, 7500 lb fuel capacity, and carbon fiber main structure, flaps, and ailerons. The nav-attack system includes an ASN-130 inertial navigator, HUD, and AYK-14 mission computer, pod-mounted advanced self-protection system, an all-weather landing system, and an angle-rate bombing system, which uses lasers and TV trackers for locking on a target. Deliveries will begin in Oct. 1983. M.S.K.

A82-21373 * # **We have just begun to create efficient transport aircraft.** D. J. Maglieri and S. M. Dollyhigh (NASA, Langley Research Center, Aeronautical Systems Div., Hampton, VA). *Astronautics and Aeronautics,* vol. 20, Feb. 1982, p. 26-38. 21 refs.

Factors affecting the cost-effectiveness and economics of the air transportation industry are reviewed. The delivery of more fuel-efficient aircraft and eventual total replacement in the 1990's by fleets of advanced aircraft are seen to offset rising fuel costs. Better airport operations are perceived to eliminate fuel-costly delays due to overcrowded runways, lack of available carriers, and maintenance of aircraft in holding patterns. Noise reduction research will lower the lawsuit costs from noise pollution, and the introduction of advanced turbofans for long, short, and medium range flights, advanced commuter planes, and advanced SSTs offering projected 50% increases in current aircraft efficiencies are seen to be limited only by the airlines' ability to provide purchase financing, rather than by a lack of available new technology. M.S.K.

A82-21374 * # **The outlook for advanced transport aircraft.** J. M. Leavens, Jr., R. D. Schaufele (Douglas Aircraft Co., Long Beach, CA), R. T. Jones (NASA, Ames Research Center, Moffett Field, CA), J. E. Steiner (Boeing Co., Seattle, WA), R. Beteille (AirBus Industrie, Blagnac, Haute-Garonne, France), G. A. Titcomb (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT), J. F. Coplin (Rolls-Royce, Ltd., London, England), B. H. Rowe (General Electric Co., Aircraft Engine Group, Cincinnati, OH), D. J. Lloyd-Jones (American Airlines, Inc., Fort Worth, TX), and W. J. Overend (Delta Air Lines, Inc., Atlanta, GA). *Astronautics and Aeronautics*, vol. 20, Feb. 1982, p. 39-62, 79.

The technological advances most likely to contribute to advanced aircraft designs and the efficiency, performance, and financial considerations driving the development directions for new aircraft are reviewed. Fuel-efficiency is perceived as the most critical factor for any new aircraft or component design, with most gains expected to come in areas of propulsion, aerodynamics, configurations, structural designs and materials, active controls, digital avionics, laminar flow control, and air-traffic control improvements. Any component area offers an efficiency improvement of 3-12%, with a maximum of 50% possible with a 4000 m range aircraft. Advanced turboprops have potential applications in short and medium haul subsonic aircraft, while a fuel efficient SST may be possible by the year 2000. Further discussion is devoted to the pivoted oblique wing aircraft, lightweight structures, and the necessity for short payback times. M.S.K.

A82-21375 * # **CAD/CAM approach to improving industry productivity gathers momentum.** R. E. Fulton (NASA, Langley Research Center, Hampton, VA). *Astronautics and Aeronautics*, vol. 20, Feb. 1982, p. 64-70. 18 refs.

Recent results and planning for the NASA/industry Integrated Programs for Aerospace-Vehicle Design (IPAD) program for improving productivity with CAD/CAM methods are outlined. The industrial group work is being mainly done by Boeing, and progress has been made in defining the designer work environment, developing requirements and a preliminary design for a future CAD/CAM system, and developing CAD/CAM technology. The work environment was defined by conducting a detailed study of a reference design process, and key software elements for a CAD/CAM system have been defined, specifically for interactive design or experiment control processes. Further work is proceeding on executive, data management, geometry and graphics, and general utility software, and dynamic aspects of the programs being developed are outlined. M.S.K.

A82-21386 **Airborne lidar measurements of smoke plume distribution, vertical transmission, and particle size.** E. E. Uthe, B. M. Morley, and N. B. Nielsen (SRI International Atmospheric Science Center, Menlo Park, CA). *Applied Optics*, vol. 21, Feb. 1, 1982, p. 460-463. 12 refs. Research supported by SRI International.

Observations were made of a dense smoke plume downwind from a forest fire using the ALPHA-1 two-wavelength downward-looking airborne lidar system. Facsimile displays were derived which depict plume dimensions, boundary layer height, and underlying terrain elevations. Results show significantly greater plume attenuation at 0.53-micron wavelengths than at 1.06-micron wavelengths, which indicates about 0.1-micron mean particle diameters, or the presence of gaseous constituents that absorb the visible radiation. A82-21391 * **Calculation of sensitivity derivatives in thermal problems by finite differences.** R. T. Haftka and D. S. Malkus (Illinois Institute of Technology, Chicago, IL). *International Journal for Numerical Methods in Engineering*, vol. 17, Dec. 1981, p. 1811-1821. 13 refs. Grant No. NsG-1266.

The optimum design of a structure subject to temperature constraints is considered. When mathematical optimization techniques are used, derivatives of the temperature constraints with respect to the design variables are usually required. In the case of large aerospace structures, such as the Space Shuttle, the computation of these derivatives can become prohibitively expensive. Analytical methods and a finite difference approach have been considered in studies conducted to improve the efficiency of the calculation of the derivatives. The present investigation explores two possibilities for enhancing the effectiveness of the finite difference approach. One procedure involves the simultaneous solution of temperatures and derivatives. The second procedure makes use of the optimum selection of the magnitude of the perturbations of the design variables to achieve maximum accuracy. G.R.

A82-21474 **Gateway diversity and competition in international air transportation.** W. B. Tye (Putnam, Hayes and Bartlett, Inc., Cambridge, MA). *Transportation*, vol. 10, Dec. 1981, p. 345-356.

Because of the existence of 'limited designation' gateways, i.e., gateways for international air travel where entry by U.S. flag carriers is limited (in many cases to only one carrier), the U.S. Civil Aeronautics Board (CAB) has announced a policy of 'gateway competition'. This policy seeks to maximize inter-gateway competition as a goal of the carrier selection process. The paper reviews the rationale and history of this policy and the economic principles of gateway competition. After addressing exceptions where gateway competition does not enhance competitive goals, the issue of how to enforce the credibility of the bidding process in route awards is addressed. The paper concludes by identifying circumstances where competitive objectives are not advanced through application of the principal gateway competition. (Author)

A82-21586 **Institute of Navigation, Annual Meeting, 36th, U.S. Naval Postgraduate School, Monterey, CA, June 23-26, 1980, Proceedings.** Washington, DC, Institute of Navigation, 1981. 143 p. Members, $30.; nonmembers, $35.

Papers are presented on the optimal processing of GPS signals, a perspective on the civil use of GPS, the application of strapdown inertial technology to attitude and heading reference system requirements, the emerging need for improved helicopter navigation, and flight control strategies for performance computers. Attention is also given to a systems approach to the design of wind shear avionics, an empirical investigation of an evaluation of Loran-C for nonprecision approach applications, the GPS evaluator, and calibrated and uncalibrated inertial navigation system performance in valid and jammed GPS environments. B.J.

A82-21587 # **Calibrated and uncalibrated inertial navigation system performance in valid and jammed global positioning system environments.** A. J. Brockstein and R. J. Grethel (Litton Industries, Guidance and Control Systems Div., Woodland Hills, CA). In: Institute of Navigation, Annual Meeting, 36th, Monterey, CA, June 23-26, 1980, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 2-10. 10 refs.

INS performance improvement that can be obtained in a jammed environment after calibration of INS instruments with GPS is compared with uncalibrated INS performance. In addition, gimbaled vs. strapdown INS performance is compared for two trajectories (field test conditions) during jammed and valid operations. It is shown that INS performance can be significantly enhanced during extended periods of GPS outage by prejam INS calibration using GPS. In addition, it is shown that strapdown systems are more difficult to calibrate than gimbaled systems since the major position contributors (gyros) are less observable for a maneuvering trajectory. In addition, the lack of gravity compensation in the strapdown system causes the gyro g-sensitive drift effect to be a major error source. B.J.

A82-21588 # **The Global Positioning System Evaluator.** S. Z. Stein (Intermetrics, Inc., Dayton, OH) and G. Pennett (USAF, Wright-Patterson AFB, OH). In: Institute of Navigation, Annual point noise source impinging on a cylinder of heated flow in which the temperature and velocity are uniform across the cross section of the jet. The shielding jet is infinite in extent along the jet axis and the radius of the jet is constant. The analytical model was compared to experimental data for a point noise source impinging on an ambient temperature, subsonic jet and on a subsonic simulated hot jet using helium as the flow medium. Results of these comparisons are discussed. M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING Semiannual Progress Report
Carl H. Gerhold 30 Jun. 1981 26 p refs
(Grant NAG1-11)
(NASA-CR-165103) Avail: NTIS HC A03/MF A01 CSCL 20A

Development of jet noise source model, and comparison to experiments with a point noise source are summarized. The refinement of the noise source is expected to resolve discrepancies noted between previous analytical results with a point noise source model and experimental results for twin-jet shielding. Comparison of the analytical model with experimental program which include shielding of a point noise source by a jet and twin jet shielding are also made. The comparisons should serve to define more completely the mechanisms of shielding. M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING Annual Progress Report
Carl H. Gerhold 31 Dec. 1980 38 p refs
(Grant NAG1-11)
(NASA-CR-165104) Avail: NTIS HC A03/MF A01 CSCL 20A

An analytical model a three-dimensional model, of twin-jet shielding, consisting of a point noise source impinging on a cylinder of heated flow in which the temperature and flow velocity are uniform across the cross-section is discussed. Wave equations are given for the regions outside the flow and within the flow cylinder and solutions are matched at the jet boundary under the conditions of continuity of pressure and continuity of the vortex sheet. The model was analyzed to identify mechanisms of transmission and diffraction which control sheilding in the shadow of the shielding jet. It was found that in the zone of the shadow region dominates, shielding is relatively insensitive to variations of such parameters as Mach Number and spacing ratio, but in the zone in which diffraction dominates, shielding is more sensitive to variations in Mach Number, jet temperature and spacing ratio. M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING Semiannual Progress Report
Carl H. Gerhold 6 Jun. 1980 18 p refs
(Grant NAG1-11)
(NASA-CR-165105) Avail: NTIS HC A02/MF A01 CSCL 20A

The development of an analytical model, an aircraft noise prediction computer program, to estimate the shielding of one jet by an adjacent jet in a twin jet configuration, is discussed. Noise estimations included consideration not only of noise sources on the aircraft, but also of the propagation path between source and receiver. A three-dimensional case is considered in which noise source is a discrete frequency point source at rest with respect to the jet axis. The shielding jet is assumed to be a cylinder of heated flow in which the temperature and flow velocity profiles are constant across the jet. The effect on shielding of the orientation of the emitting jet with respect to the shielding jet was investigated. Forward and backward scattering phenomena as well as the influence of jet flow speed were also investigated. M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING DEVELOPMENT OF A 3-DIMENSIONAL MODEL Progress Report
Carl H. Gerhold 4 Nov. 1980 24 p refs Sponsored by NASA
(NASA-CR-165106) Avail: NTIS HC A02/MF A01 CSCL 20A

The solution for a point source impinging on a cylinder of heated flow is presented. The indefinite integral is solved approximately using a saddle of point method. Comparison of the three-dimensional model to a previously obtained two-dimensional model of twin jet noise indicate the the approximate solution of the integral is valid. The model was analyzed to differentiate among the mechanims of shielding. Zone in which diffraction and transmission dominate are identified. The model was found to compare to experimental shielding results. M.D.K.

ANALYTICAL STUDY OF TWIN-JET SHIELDING TWO-DIMENSIONAL MODEL
Carl H. Gerhold 15 Aug. 1980 17 p refs
(Grant NAG1-11)
(NASA-CR-165107) Avail: NTIS HC A02/MF A01 CSCL 20A

The development of an analytical model to estimate the shielding of one jet by an adjacent jet in a twin jet configuration is discussed in relation to aircraft generated noise. The azimuthal redistribution of sound defining the shadow zone is investigated. Wave equations were solved in the plane normal to the jet axis to estimate the diffraction and reflection of sound by a heated, cylindrical jet. Thus, the noise source considered is essentially a line source assumed to emit at discrete frequency and at rest with respect to the shielding jet which is assumed to be a cylinder of heated flow in which the temperature is constant across the jet. Results show that the sound pressure decreases rapidly with frequency beyond the onset of the shielding to a minimum value. Results also show that increasing the spacing between the source and the jet shifts the curves toward higher frequencies. M.D.K.

COMMUNITY SENSITIVITY TO CHANGES IN AIRCRAFT NOISE EXPOSURE Final Report
S. Fidell, R. Horonjeff, S. Teffeteller, and K. Pearsons NASA Dec. 1981 122 p refs
(Contract NAS1-14611)
(NASA-CR-3490; BBN-4212) Avail: NTIS HC A06/MF A01 CSCL 20A

Interviews were conducted in the vicinity of Burbank Airport during a four month period during which a counterbalanced series of changes in aircraft noise exposure occurred due to runway repairs. Another interview was undertaken approximately one year after completion of the initial runway repairs. Noise measurements were made in conjunction with administration of a brief questionnaire to a near exhaustive sample of residents in four airport neighborhoods. The magnitude and direction of change of annoyance with aircraft noise exposure corresponded closely to the actual changes in physical exposure. Estimates were made of time constants for the rate of change of attitudes toward aircraft noise. S.L.

NOISE OF THE SR-3 PROPELLER MODEL AT 2 DEG AND 4 DEG ANGLE OF ATTACK
James H. Dittmar and Robert J. Jeracki Dec. 1981 30 p refs
(NASA-TM-82738; E-1051) Avail: NTIS HC A03/MF A01 CSCL 20A

The noise effect of operating supersonic tip speed propellers at angle of attack with respect to the incoming flow was determined. Increases in the maximum blade passage noise were observed for the propeller operating at angle of attack. The noise increase was not symmetrical with one wall of the wind tunnel having significantly more noise increase than the other wall. This was apparently the result of the rotational direction of the propeller. The lack of symmetry of the noise at angle of attack to the use of oppositely rotating propellers on opposite sides of an airplane fuselage as a way of minimizing the noise due to operation at angle of attack. J.D.H.

A SHOCK WAVE APPROACH TO THE NOISE OF SUPERSONIC PROPELLERS
James H. Dittmar and Edward J. Rice Dec. 1981 19 p refs
(NASA-TM-82752; E-1068) Avail: NTIS HC A02/MF A01

CSCL 20A

To model propeller noise expected for a turboprop aircraft, the pressure ratio across the shock at the propeller tip was calculated and compared with noise data from three propellers. At helical tip Mach numbers over 1.0, using only the tip shock wave, the model gave a fairly good prediction of the noise for a bladed propeller and for a propeller swept for aerodynamic purposes. However for another propeller, which was highly swept and designed to have noise cancellations from the inboard propeller sections, the shock strength from the tip over predicted the noise. In general the good agreement indicates that shock theory is a viable method for predicting the noise from these supersonic propellers but that the shock strengths from all of the blade sections need to be properly included. PREDICTION OF SOUND RADIATION FROM DIFFERENT PRACTICAL JET ENGINE INLETS Semiannual Status Report, 1 Jun. 1981 - 1 Dec. 1981
Ben T. Zinn and William L. Meyer 1982 127 p refs
(Grant NAG3-67)
(NASA-CR-165120) Avail: NTIS HC A07/MF A01 CSCL 20A

The computer codes necessary for this study were developed and checked against exact solutions generated by the point source method using the NASA Lewis QCSEE inlet geometry. These computer codes were used to predict the acoustic properties of the following five inlet configurations: the NASA Langley Bellmouth, the NASA Lewis JT15D-1 Ground Test Nacelle, and three finite hyperbolic inlets of 50, 70 and 90 degrees. Thirty-five computer runs were done for the NASA Langley Bellmouth. For each of these computer runs, the reflection coefficient at the duct exit plane was calculated as was the far field radiation pattern. These results are presented in both graphical and tabular form with many of the results cross plotted so that trends in the results verses cut-off ratio (wave number) and tangential mode number may be easily identified. DEVELOPMENT OF IN-CAN MELTING PROCESS AND EQUIPMENT, 1979 AND 1980
L. L. Petkus, D. E. Larson, W. J. Bjorklund, and L. K. Holton
Sep. 1981 46 p refs
(Contract DE-AC06-76RL-01830)
(DE82-001050; PNL-3957) Avail: NTIS HC A03/MF A01

Nonradioactive process testing continued with the in-can melter as part of an investigation into the applicability of this vitrification process to various calcined high level and incinerator ash radioactive wastes. How waste composition and canister fins affect in-can melter capacity and how waste composition affects glass quality were examined. Process performance proved to be generally satisfactory. Pilot scale in-can melter runs were performed with synthetic, nonradioactive, high level wastes to produce eight canisters of glass. The synthetic waste processed included high level wastes as well as transuranic ash waste. Full scale in-can melter runs using nonradioactive materials were also conducted, producing ten canisters of glass. In the full scale in-can melter furnace the baffles separating the six heating zones were removed because of baffle warping. A remotely operated section connecting the spray calciner to the canister was tested. Some problems were encountered with calcine plugging. DOE

TEST AND EVALUATION OF UV FIBER OPTICS FOR APPLICATION FOR AIRCRAFT FIRE DETECTOR SYSTEMS Final Report, 23 May 1980 - 23 Mar. 1981
Dayton, Ohio AFWAL Jun. 1981 58 p refs
(Contract F33615-80-C-2042; AF Proj. 3048)
(AD-A106129; AFWAL-TR-81-2049) Avail: NTIS HC A04/MF A01 CSCL 17/5

It was found that in the U.V. solar blind region, there are severe limitations on the field of view obtainable in Fiber Optic coupled systems. These restrictions are such as to make further consideration of the wide angle system concept unprofitable. This effectively limits the use of such systems in fire detection to applications where the precise location of a flame can be predicted. It is concluded that the performance of optical fibers in the U.V. solar blind wavelengths is such that the trade-off gains proposed in AFAPL-TR-78-84 cannot be realized in practice. Author (GRA)

BUILT-IN-TEST EQUIPMENT REQUIREMENTS WORKSHOP. WORKSHOP PRESENTATION Final Report, 1 Oct. 1980 - 28 Feb. 1981
Aug. 1981 235 p refs Workshop held at Arlington, Va., 11-13 Feb. 1981
(Contract MDA903-79-C-0320)
(AD-A107842; AD-E500460; IDA-P-1600) Avail: NTIS HC A11/MF A01 CSCL 09/3

A workshop was held for the purpose of assessing progress and problems in specifying and testing Built-In-Test (BIT) used in complex electronic equipment. The workshop's principal recommendation is that the current specification and test approach be broadened to include all capabilities associated with the detection and isolation of faults. Current practices generally address only a narrow subset of these capabilities, namely, BIT. The workshop participants defined this broad capability as '100 Percent Diagnostics.' The diagnostic capability is considered to have two components--'automatic' and 'manual.' The automatic component consists of BIT or semi-automatic BIT with technical manuals, while the manual component consists of personnel using logic, external test equipment and/or manual test procedures. Observations on current experience with BIT, recommendations to improve specification and testing of '100 Percent Diagnostics' that can be put into practice in the near term, and proposed research areas are presented. ADVANCED TRANSMISSION COMPONENT DEVELOPMENT
Kenneth M. Rosen and Harold K. Frint *In* AGARD Helicopter Propulsion Systems Sep. 1981 17 p refs

Avail: NTIS HC A13/MF A01

Design innovations in helicopter gearbox development which permit high temperature operation at increased speeds without degrading strength or weight goals are discussed. One avenue of investigation, which shows promising strength or weight advantages, is high contact ratio gearing. The means taken to obtain a high contact ratio tends to produce an inherently weaker tooth and reliance must be placed on the multiple load-sharing feature of this design to achieve an advantage over low contact ratio gears. The appropriate consideration which must be addressed in the design stage to achieve optimum results is described. To provide high temperature capability, two UH-60A helicopter main transmission housings were fabricated from a stainless steel alloy to replace the conventional magnesium alloy casing. Design details and fabrication procedures are discussed. J.D.H.

HELICOPTER DEVELOPMENT IN FRANCE [LE DEVELOPPEMENT DES HELICOPTERES EN FRANCE]
Daniel Berthault *In* AGARD Helicopter Propulsion Systems Sep. 1981 9 p In FRENCH

Avail: NTIS HC A13/MF A01

For the French helicopter industry, the last two decades correspond to a period of rapid growth. The national armed forces were supplied with significant quantities of good quality military equipment well adapted to their operational objectives. Considerable successes were met in the sale for exploration of military helicopters as well as other machines for civilian use, which were developed by taking account of market requirements. These were often classed in a very favorable manner in relation to the products of competitors. The essential characteristics of helicopter development in France during this period are traced. The lines of direction and the modality of action taken by various public services in this regard are analyzed. By defining future needs and the centers of action, perspectives for the future are outlined. Transl. by A.R.H.

HELICOPTER AIR INLETS [ENTREES D'AIR D'HELICOPTERES]
A. Vuillet *In* AGARD Helicopter Propulsion Systems Sep. 1981 9 p refs In FRENCH

Avail: NTIS HC A13/MF A01

Because of engine architecture, air inlets on low and medium tonnage helicopters are located behind the rotor head, which makes feeding very difficult. This is particularly the case of the Ecureuil AS 350 and the Dauphin SA 365 which are equipped with new generation engines. These turbines have axial or annular intakes behind which the reductor is located beside either the blast pipe or the compressor. An indepth study of the air intakes from the project stage can permit their design with a minimum of unlucky repercussions on the power supplied by the engine, on the layer of the device, and on risks to pumping. For this reason, such a study is needed to reduce the delays and costs of operating such an intake in flight. Methods used at Aerospatial and results obtained on different devices are described. THE DISTRESS REGIME ON THE BIMOTORED HELICOPTER [REGIME DE DETRESSE SUR HELICOPTERE BIMOTEUR]
J. P. Dedieu, M. Russier, and H. Dabbadie (Societe Turbomeca, Bordes, France) *In* AGARD Helicopter Propulsion Systems Sep. 1981 8 p refs In FRENCH

Avail: NTIS HC A13/MF A01

The trend toward bimotorization of civil and military helicopters raises the question of choice of power level for each engine in order to obtain acceptable performance in case of engine trouble, particularly at very low speed. The use of a distress regime to obtain a very high power level, for a short time, once in the life of an engine seems to be an interesting and promising approach. The relation between the levels of distress power and parameters related to the use of the helicopter, takeoff, mass, ceiling, and operating cost are considered for the case of a bimotored helicopter of average weight. The perspectives of homologization and the civil certification of such a regime on real technology engines are examined. Transl. by A.R.H.

PROBLEMS OF ENGINE RESPONSE DURING TRANSIENT MANEUVERS
Dino Dini *In* AGARD Helicopter Propulsion Systems Sep. 1981 14 p refs
Avail: NTIS HC A13/MF A01

Helicopter transition flight regime and extreme flight maneuvers which determine abrupt variation of the rotor drag torque during each revolution, and the corresponding effects on the engine are discussed. Repeated surging and the attendant transient torsional loads from the engine cause damage to the airframe components. The angular rotor acceleration, cyclically variable, influences the turbine gas producer rotor speed, introducing flow distortions and aeromechanical effects in all the engine. It is found that periodic and inertial blade loading has serious consequences to discs and shaft to which the blades are attached. The higher harmonics of the excitation over the discs provokes relevant flexural modes of forced vibration. Operation in transient rating with pitch increase or decrease has the greatest effect on the helicopter flight performance, owing to the power application capability and the fuel control system adaptability. It is shown that to obtain sufficient engine/airframe dynamic compatibility, aircraft developments have to incorporate technical advances, which include harmonic integrated controls for propulsion and flight systems. E.A.K.

HELICOPTER PROPULSIONS SYSTEMS. 1: VIBRATION PREVENTION SYSTEMS ON HELICOPTERS 2: PROBLEM OF NOISE IN THE CABIN
Gerard Genoux and Henri-James Marze *In* AGARD Helicopter Propulsion Systems Sep. 1981 19 p refs

Avail: NTIS HC A13/MF A01

Two different facets of the propulsion system/structure interaction are presented. The first interaction deals with low frequency vibration associated with the operation of the main rotor. These problems are either mechanical material fatigue and stressing or related to comfort. Implementation for reduction excitations and filtration of their transfer from the source to the cabin are described. The second interaction type is cabin noise associated with the operation of the reduction gear box. The vibratory energy generated at the gears propagates all the way to the passengers via the air and the structure. Cutting the intensity of transmission noise sources, the energy transfer between such sources and the structure and the energy radiation from the structure to the passengers is discussed. E.A.K.

AN ALTERNATIVE APPROACH TO ENGINEERING STRUCTURES USING MONITORING SYSTEMS
D. Lewis *In* AGARD Helicopter Propulsion Systems Sep. 1981 11 p
Avail: NTIS HC A13/MF A01

The micro processor based engine monitoring system (EMS) which reevaluates the rating structure and presents limitations to the pilots is discussed. The EMS system allows the achievement of a better relationship between the demonstrated capability of the engine and the authorized release for in service use. This is a first step to be followed later by a change of the qualification test to a more representative form in which the EMS gives a more tangible link between bench test and customer operation. This allows better use of the engine to be made for the short time/high power requirements giving a more efficient engine performance at cruise conditions. E.A.K.

FUTURE REQUIREMENTS FOR HELICOPTER PROPULSION SYSTEMS
H.-G. Bree and G. Backmann *In* AGARD Helicopter Propulsion Systems Sep. 1981 13 p refs

Avail: NTIS HC A13/MF A01

The measurements for single or twin engine systems are discussed. The trend to more sophisticated engines is reviewed in the light of diminishing resources of materials and fuel. Expected future economic conditions make it mandatory to counteract the increase of life cycle cost experienced in most of today's military systems. Means to reduce LCC are discussed. E.A.K.

AN INVESTIGATION OF MULTI-AXIS ISOMETRIC SIDE-ARM CONTROLLERS IN A VARIABLE STABILITY HELICOPTER
M. Sinclair and M. Morgan Aug. 1981 25 p ref
(AD-A106759; NAE-LR-606; NRC-19629) HC A02/MF A01 CSCL 01/4

The test aircraft was the NAE Airborne Simulator, an extensively modified Bell Model 205A-1, and the evaluation flights encompassed a wide range of demanding tasks from hover maneuvering and transitions to cruising flight, to nap-of-the-earth flight and precision IFR tracking. The isometric control systems included several two-handed and one-handed configurations with force-pedals for directional control, and one fully-integrated system which provided full control of the helicopter with either hand. PARALLEL COMPUTATION FOR DEVELOPING NONLINEAR CONTROL PROCEDURES Final Report, 1 Sep. 1977 - 30 Sep. 1979
Howard Kaufman and Richard Travassos Jul. 1981 238 p refs
(Grant AF-AFOSR-3418-77; AF Proj. 2307)
(AD-A107914; AFWAL-TR-81-3016) Avail: NTIS HC A11/MF A01 CSCL 09/2

Efforts since 1 October 1978 have been concerned with the application of the developed parallel optimization procedures to the design of non-linear flight control systems. Consideration has been given to the advantages to be gained from the direct use of the non-linear equations of motion and to the potential for rapid on-line optimization in response to tracked parameter changes and/or changes in the mission objectives. To date, based upon the non-linear longitudinal equations for the F-8, it has been shown that parallel optimization procedures alone can reduce the time required for optimization by at least 30% and that the direct use of the nonlinear (rather then the linearized) equations of motion does indeed improve attitude control. A study of further incorporation of parallelism into the basic utility routines such as integration and matrix manipulation has shown that the convergence time for a representative optimal control computation can be reduced by a factor of 20. Thus, it was concluded that incorporation of parallel computers might indeed permit online control computation and/or adaptation. To this effect possible architectural structures for such computers have also been studied. GRA

SCALE-MODEL STUDIES FOR THE IMPROVEMENT OF FLOW PATTERNS OF A LOW-SPEED TUNNEL Final Report, 1 Mar. - 31 May 1981
P. Stephen Barna Jan. 1982 46 p refs
(Grant NsG-1563)
(NASA-CR-169413) Avail: NTIS HC A03/MF A01 CSCL 14B

Parameters affecting the performance of a scale model V/STOL wind tunnel were measured. These included: (1) static pressure variation around the closed tunnel circuit as affected by the application of various screens; (2) pressure rise and radial distribution of flow through the fan; (3) variation of screen parameters and screen location affecting the flow; and (4) effects of multiple screens on the velocity distribution in the fourth diffuser. In these tests the fan was driven through a long shaft by an externally situated 11,190-W (15-HP) motor equipped to turn at 4 speeds. B.W.

provides sufficient ground clearance; the use of gas turbine propulsive units, interior noise attenuation; and additional communication linkages. The weight of the helicopter and the diameter of its rotor must also be determined. As an example, the German BK 117 and BO 105 rescue helicopters are discussed in detail; the necessary mobile and standard equipment and instrumentation for these aircraft are illustrated. J.F.

A82-19021 **Aircraft for secondary long range emergency ambulance flight.** K. J. J. Waldeck and G. B. J. Bramer (Algemeene Nederlandsche Wielrijders Bond, The Hague, Netherlands). In: Aeromedical evacuation; Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports. Munich, Allgemeiner Deutscher Automobile-Club, 1981, p. 460-463.

The primary aim for medical transport today is mobile intensive treatment and care. Rules and directives for medical assistance in flight must therefore be developed, and an ambulance for long-range emergency flight must be designed. This includes the need for special equipment, such as a floating stretcher, which will protect the body of the patient against accelerations with frequencies, corresponding with the natural frequencies of parts of the body and organs. The Fokker F-27 Friendship turboprop from Holland has been converted into an ambulance aircraft with the primary function of in-flight intensive treatment and care. The helicopter features three compartments for (1) the patient and medical equipment; (2) the medical personnel; and (3) the passengers. The F-27 has a large front cargo door with lift installation and a communication area to maintain radio contact with a ground station for medical purposes. The whole medical system can be loaded into the aircraft on pallets, thus enabling every F-17 fitted with a front cargo door to be converted into an ambulance-aircraft within a short period. J.F.

A82-19061 # **An application of total synthesis to robust coupled design.** M. K. Sain, R. M. Schafer, and K. P. Dudek (Notre Dame, University, Notre Dame, IN). In: Annual Allerton Conference on Communication, Control, and Computing, 18th, Monticello, IL, October 8-10, 1980, Proceedings. Urbana, IL, University of Illinois, 1980, p. 386-395. 10 refs. Contract No. N00014-79-C-0475.

Total synthesis techniques for the control of linear multivariable systems are module theoretic methods aimed at bottom line design, wherein the designer selects at the outset the control action and system response characteristics which will be attained. This selection is made from the class having associated with it the possibility of an internally stable feedback realization. In practice, however, such realizations are normally carried out with decentralized dynamics - or fixed structure. Moreover, they must be achieved in such a way that plant parameter variation does not materially inhibit the nominal filter responses. This paper reports on the extension of the Total Synthesis Problem (TSP) concept to robust feedback realizations of fixed structure. An example from turbojet engine data illustrates the concepts. (Author)

A82-19065 # **The use of adaptive control for helicopter trajectories in search operations.** A. Chacón, M. Azagoury, B. Fernández (Universidad Simón Bolívar, Caracas, Venezuela), R. Padilla, and C. Padilla (Instituto Venezolano de Investigaciones Científicas, Caracas, Venezuela). In: Annual Allerton Conference on Communication, Control, and Computing, 18th, Monticello, IL, October 8-10, 1980, Proceedings. Urbana, IL, University of Illinois. 1980, p. 633-642.

An effective and successful search operation by helicopter requires close tracking of predetermined trajectories defined by the characteristics of the terrain and the prior information available to the search party. We investigate here the design of an adaptive controller such that the helicopter follows a predetermined trajectory in a horizontal plane. A model reference control approach is used. Simulation results are given to illustrate the behavior of the controller. (Author)

A82-19069 # **Broader bandwidth for thin conformal antennas.** K. D. Arkind (Sanders Associates, Inc., Nashua, NH). *Astronautics and Aeronautics,* vol. 20, Jan. 1982, p. 31-33.

Current broadband design technology for thin arrays is described. The ability now exists to analyze array concepts with arbitrary element locations and to use printed circuit antenna concepts, which yields minimum drag on a vehicle surface and reduces the cost of complex array designs. A tee-fed-slot design is described which offers 10-20 times the bandwidths of a similar microstrip counterpart, and is noted to employ layered construction. The array antenna is suggested for applications in ECM environments for radar and communications. M.S.K.

A82-19071 * # **On the track of practical forward-swept wings.** T. J. Hertz, M. H. Shirk (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH), R. H. Ricketts (NASA, Langley Research Center, Hampton, VA), and T. A. Weisshaar (Purdue University, West Lafayette, IN). *Astronautics and Aeronautics,* vol. 20, Jan. 1982, p. 40-52. 30 refs.

Structural laminates which comprise wing-cover skins for forward swept winged aircraft are examined. The laminates are themselves composed of lamina arranged in a symmetrical and unbalanced fashion. The fibers are oriented so that no fiber has a counterpart in the same ply which is at an exact anti-angle to itself. The laminate orientation creates a wash-out in a forward swept wing and alleviates aeroelastic loading. Further discussion is devoted to center-of-pressure movement, flutter behavior, aeroelasticity and aeroelastic divergence, and wind tunnel testing of aerodynamically tailored wings. It is found that rotating the laminate to increase the divergence dynamic pressure decreases strain under aerodynamic loading. Flight tests with three models are reported, and it is concluded that divergence can be avoided by the use of an efficient composite structure. M.S.K.

A82-19195 **A simplified wing procedure in connection with the lifting line theory and the doublet-lattice method (Ein vereinfachtes Tragflächenverfahren in Verbindung mit der Traglinientheorie und der Doublet-Lattice Methode).** R. Dziurzynski and M. Nowak (Polska Akademia Nauk, Instytut Podstawowych Problemow Techniki, Warsaw, Poland). *(Gesellschaft für angewandte Mathematik und Mechanik, Wissenschaftliche Jahrestagung, Berlin, West Germany, Apr. 8-11, 1980.) Zeitschrift für angewandte Mathematik und Mechanik,* vol. 61, Apr. 1981, p. T 145, T 146. In German.

A82-19197 **Use of high conical flow theory for the determination of the pressure distribution on the wave rider and its agreement with experimental results for supersonic flow.** A. Nastase and H. Stahl (Aachen, Rheinisch-Westfälische Technische Hochschule, Aachen, West Germany). *(Gesellschaft für angewandte Mathematik und Mechanik, Wissenschaftliche Jahrestagung, Berlin, West Germany, Apr. 8-11, 1980.) Zeitschrift für angewandte Mathematik und Mechanik,* vol. 61, Apr. 1981, p. T 165-T 168. 13 refs.

The considered wave rider is a delta wing which is designed specifically for hypersonic flight at the cruising Mach number 7. After a flight outside the atmosphere, the wave rider will reenter at supersonic speed. The present investigation is concerned with the theoretical determination of the distribution of the pressure coefficient on the wing surface. The calculation procedure involves the solution of a boundary value problem with respect to the axial disturbance velocity. In the considered case, it is necessary to find the solution of a three-dimensional linearized partial differential equation, taking into account the linearized boundary condition on the wing, or the Mach cone (at the apex of the wave rider), and at infinity. A comparison of the theoretically and experimentally determined values for the pressure distribution shows very good agreement for the entire wing surface. G.R.

A82-19198 **The velocity potential for the harmonically oscillating, rectangular wing with semiinfinite span in nonlinear theory (Das Geschwindigkeitspotential für den harmonisch schwingenden, rechteckigen Flügel halbunendlicher Spannweite in der nichtlinearen Theorie).** S. Turbatu (Centrul National de Fizica, Bucharest, Rumania). *(Gesellschaft für angewandte Mathematik und Mechanik, Wissenschaftliche Jahrestagung, Berlin, West Germany, Apr. 8-11, 1980.) Zeitschrift für angewandte Mathematik und Mechanik,* vol. 61, Apr. 1981, p. T 193-T 195. 9 refs. In German.

A nonlinear potential equation employed by Landahl (1961) is considered. The equation is obtained on the basis of small perturbation theory for conditions near the sonic velocity. The present investigation is concerned with flows for which the free stream Mach number is one. The simplified equation corresponding to the selected condition is solved with the aid of an approach reported by Teipel (1964) and Ruo (1974). The solution procedure makes also use of the parabolic method considered by Oswatitsch and Keune (1955). A boundary value problem is obtained, and solved according to a method reported by Burger (1959). A general formula for the calculation of all desired quantities is derived, and the solution of the problem for the wing is obtained. The formula can be transformed into an expression of linear theory by setting a certain parameter equal to zero. The resulting expression agrees with the solution reported by Turbatu (1964, 1979). G.R.

A82-19201 * # **Ground effect hover characteristics of a large-scale twin tilt-nacelle V/STOL model.** M. R. Dudley, M. D. Falarski (NASA, Ames Research Center, Moffett Field, CA), A. Pisano (U.S. Navy, Naval Air Systems Command, Washington, DC), and W. G. Hill (Grumman Aerospace Corp., Bethpage, NY). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2609.* 11 p. 8 refs. Research sponsored by the Grumman Aerospace Corp., U.S. Navy, and NASA.

This paper is a summary of an analysis of the ground-effect characteristics of a large-scale twin-engine, tilt-nacelle V/STOL model. The analysis considers data from the flow field beneath the full-scale model, as well as small-scale model test data, and makes comparisons with jet-ground interactions predicted by a computer code. The data from the large-scale test comprise ground-plane surface temperatures, static pressure distribution and wall-jet total-pressure profiles, fuselage undersurface static pressures, and model forces and moments. The results indicate that the near-field flow is more complex than is indicated by either the small-scale uniform jet studies or the computer predictions. The far field flow characteristics do show some similarity for these three cases. (Author)

A82-19202 * # **Experimental investigation of a jet inclined to a subsonic crossflow.** K. Aoyagi and P. K. Snyder (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2610.* 15 p. 10 refs.

Experimental investigations have been conducted to determine the surface-pressure distribution on a flat plate and a body of revolution with a jet issuing at a large angle to the free stream and to obtain a better understanding of the entrainment mechanism close to the jet exit by quantitative mean velocity surveys. Pressure data were obtained with a flat plate model at several nozzle injection angles using a single round nozzle. For the body of revolution model, data were obtained with a round jet exhausting perpendicular to the crossflow and with two round jets spaced two to six nozzle diameters apart. Mean velocity measurements were obtained with laser velocimeter surveys near the base of a round jet exhausting normal to a flat plate. For the flat plate model, the pressure field shifts downstream and the entrainment effect decreases with decreasing nozzle injection angle. For the body of revolution model with two jets, the jet-induced effect of the rear jet on the surface-pressure distribution was less than the front jet. The flow regions close to the jet are defined by the laser surveys, but further mean velocity surveys are required to understand the entrainment mechanism. (Author)

A82-19203 * # **Thrust-induced effects on low-speed aerodynamics of fighter aircraft.** D. W. Banks, P. F. Quinto, and J. W. Paulson, Jr. (NASA, Langley Research Center, Subsonic Aerodynamics Branch, Hampton, VA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2612.* 10 p. 10 refs.

The design and technology requirements for STOL fighter aircraft as defined in NASA studies are reviewed. The research has concentrated on advanced high-lift systems using mechanical flaps, methods of obtaining longitudinal trim during the use of thrust vectoring, and thrust reversal to shorten ground roll distances. Several early configurations are described, and investigations of the effect of thrust reversal on the low-speed aerodynamics of the F-15 are detailed. Although the NASA design was a wing-canard configuration, similarities in a Grumman baseline STOL aircraft allowed incorporation of the Grumman nacelle, primary nozzles, spanwise blowing nozzles, and trailing-edge flap systems. M.S.K.

A82-19204 # **Tactical STOL moment balance through innovative configuration technology.** G. J. Eckard, R. C. Sutton (Boeing Military Airplane Co., Seattle, WA), and G. E. Poth (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2615.* 15 p.

Innovative and conventional thrust vectoring moment balance mechanisms, as applied to advanced tactical fighters, are examined. The innovative mechanisms include thrust line translation, life line translation, and auxiliary power control; the conventional mechanisms under investigation are horizontal tails, canards, and variable sweep wings. These mechanisms are tested for their ability to provide negative static margins for landing approach or relocation of the vectored thrust line nearer the aircraft's center of gravity. The net pitching moment due to wing, flaps, and vectored thrust lift would then be small, making possible beneficial trim forces from small trimming devices. These innovative mechanisms are, however, possibly heavy and must be evaluated on their complexity, reliability, maintainability, and STOL capabilities. Several candidate fighter configurations are compared and evaluated. J.F.

A82-19205 # **Application of thrust vectoring for STOL.** P. D. Whitten, R. W. Woodrey, and J. E. Hames (General Dynamics Corp., Fort Worth, TX). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2616.* 13 p. 12 refs.

Studies of generic aircraft configurations to determine the payoff of thrust vectoring for direct lift during STOL landings and takeoff and for control power augmentation during weapons-delivery maneuvers are described. Results show that for a nominal 1000-foot landing distance, direct-lift benefits are small, but significant improvements in control power augmentation contribute to payoffs in takeoff distance and recovery from roll-pitch-coupling-induced departures at high angles of attack. (Author)

A82-19206 # **STOL capability impact on advanced tactical aircraft design.** R. E. Krepski (Grumman Aerospace Corp., Bethpage, NY) and R. E. Hudson, Jr. (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2617.* 9 p.

The design and technical issues affecting supersonic STOL development as an airbase attack fighter are discussed. An Air Force study has indicated that, from a weight and cost standpoint, the preferred directions will include two-dimensional nozzles with vectoring and thrust reversing capability. Take-off and landing requirements would determine other design features, and the use of a jump strut to enable landing maneuvers to be made at pitch angles which would normally drag the tail is detailed. The addition of a tip-mounted reaction control system is foreseen as necessary for roll control at the low aerodynamic speeds of STOL landing. A severe 700 ft landing distance design is outlined, and includes a lifting engine with bleed-air features to feed the reaction control system. M.S.K.

A82-19207 * # **Analysis of data from a wind tunnel investigation of a large-scale model of a highly maneuverable supersonic V/STOL fighter - STOL configuration.** M. D. Falarski, M. D. Dudley (NASA, Ames Research Center, Moffett Field, CA), and G. Howell (General Dynamics Corp., Fort Worth, TX). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2620.* 21 p. 13 refs.

The surface pressure and thermal characteristics of a large-scale model of a highly maneuverable supersonic fighter with STOL capability are described. The 7.28 m span model is powered by two J-97 turbojets, operated at 9340 N thrust. It combines upper-surface and spanwise blowing to augment the lift characteristics over a wide flying the airplane so as to zero the horizontal and vertical needles, the pilot flies an approximation to a time-optimal intercept trajectory. The various display and computation modes that are available will be described and results will be presented illustrating the performance of the algorithms with a pilot in the loop. (Author)

A82-20297 * # **Development of a digital integrated automatic landing system /DIALS/ for steep approach and landing.** N. Halyo (Information and Control Systems, Inc., Hampton, VA) and R. M. Hueschen (NASA, Langley Research Center, Hampton, VA). *AIChE, ASME, IEEE, and ISA, Joint Automatic Control Conference, University of Virginia, Charlottesville, VA, June 17-19, 1981, Paper,* 10 p. 12 refs. Contracts No. NAS1-15116; No. NAS1-12754.

This paper describes the development of a three-dimensional digital integrated automatic landing system (DIALS) for a small commercial jet transport. The system uses the Microwave Landing System (MLS), body-mounted accelerometers, as well as on-board sensors usually available on commercial aircraft, but does not require inertial platforms. The system development uses modern digital control techniques. The phases of flight considered are the localizer and glideslope capture, which may be performed simultaneously or sequentially, localizer and glideslope track (hold), crab/decrab, and flare to touchdown. The system captures, tracks and flares from steep glideslopes (2.5 - 5.5 deg) selected prior to glideslope capture. The results of a nonlinear simulation are presented. (Author)

A82-20298 # **Endwall boundary layer flows and losses in an axial turbine stage.** I. H. Hunter (Shell Research, Ltd., Thornton Research Centre, Chester, Ches., England). *(American Society of Mechanical Engineers, International Gas Turbine Conference and Products Show, Houston, TX, Mar. 9-12, 1981.) ASME, Transactions, Journal of Engineering for Power,* vol. 104, Jan. 1982, p. 184-193. 12 refs. Research supported by the Central Electricity Generating Board.

In order to gain an insight into boundary layer phenomena in axial flow turbines, experimental studies were carried out on a large-scale, low speed, single stage machine. Low and high frequency instrumentation supplemented by flow visualizations were used to determine the details of the flows and losses in the stator and rotor blade rows. Measurements of the turbine stator flows, which were obtained at two different inlet wall boundary layer thicknesses, were generally consistent with typical linear cascade observations. A major difference concerned the presence of appreciable radially directed flow. Hot-wire anemometry measurements at the turbine rotor exit, revealed strong secondary flows at the high turning hub section. The flow pattern was seen to be influenced by the spacing between the two rows of blades and by the rotor's instantaneous position with respect to the periodic flow field arising from the upstream stator row. (Author)

A82-20299 # **Boundary layer transition and separation on a compressor rotor airfoil.** R. P. Dring (United Technologies Research Center, East Hartford, CT). *ASME, Transactions, Journal of Engineering for Power,* vol. 104, Jan. 1982, p. 251-253.

Boundary layer calculations based on potential flow comparisons and comparisons with surface flow visualizations are presented for locating the boundary layer transition and separation. The flow at the midspan of a multistage compressor was studied using Ozalid paper on the blades in an ammonia flow with operational conditions. A turbulent boundary layer calculation showed separation close to the trailing edge, while actual observations showed attachment at the trailing edge. The visualization technique using Ozalid paper on compressor rotors is judged to be effective in studying boundary layer transition where centrifugal and Coriolis forces cause boundary layer skewing, and allows two-dimensional boundary layer analysis for predictions of the locations of transition and separation in the design of compressor airfoils. M.S.K.

A82-20407 **Mapping in tropical forests - A new approach using the laser APR.** H. Arp, J. C. Griesbach (TRANARG CA, Caracas, Venezuela), and J. P. Burns. *Photogrammetric Engineering and Remote Sensing,* vol. 48, Jan. 1982, p. 91-100. 7 refs.

Novel techniques involving the Laser Airborne Profile Recorder (Laser APR) have been developed as a solution to the problem of topographic mapping in dense tropical forests. The narrow laser beam used is able not only to record profiles of the tree canopy, but penetrate through small openings to ground level. Tree heights are then determined by comparing recorded profiles. The system is applied to the mapping of the Rio Caura reservoir site in southern Venezuela, where topographic maps showing 5-10 m contours of the 800 sq km area were completed in five months by means of Laser APR flights at 1.5 km intervals. A special, three-channel Autotape, mounted on a helicopter, was used in photogrammetric control location by trilateration from ground stations to the hovering aircraft. Many Laser APR-derived elevations were identified on the existing, 1:50,000-scale photography used for the mapping. O.C.

A82-20447 * # **Structure and variability of the Alboran Sea frontal system.** R. E. Cheney (NASA, Goddard Space Flight Center, Greenbelt, MD) and R. A. Doblar (U.S. Navy, Naval Ocean Research and Development Activity, Bay St. Louis, MS). *Journal of Geophysical Research,* vol. 87, Jan. 20, 1982, p. 585-594. 8 refs. Navy-sponsored research.

A distinct oceanic front coinciding with the jet of incoming North Atlantic water, and an associated anticyclonic gyre in the western half of the basin, were observed during a ship and aircraft survey of the physical characteristics of the Alboran Sea in the western Mediterranean in October 1977. The front was confined to the upper 200 m and was a continuous feature, extending from the Strait of Gibraltar 500 km eastward to the prime meridian. It is noted that in ten days between two surveys, the center of the gyre shifted 50 km westward. This variability of the anticyclonic gyre may correspond to changes of North Atlantic inflow strength, as inferred by local wind and the average atmospheric pressure over the western Mediterranean. O.C.

A82-20506 **Methods and models for predicting fatigue crack growth under random loading.** Edited by J. B. Chang (Rockwell International Corp., North American Aircraft Div., Los Angeles, CA) and C. M. Hudson (NASA, Langley Research Center, Hampton, VA). Philadelphia, PA, American Society for Testing and Materials (ASTM Special Technical Publication, No. 748), 1981. 145 p. $16.50.

Papers are presented in the volume summarizing the baseline data, methodology, procedures, and results of a round-robin analysis which was conducted to predict the fatigue crack growth in 2219-T851 aluminum center-cracked specimens subjected to flight loading in random cycle-by-cycle format. The objective of the analysis was to assess whether data from constant-amplitude fatigue crack growth tests on center-cracked specimens can be used to predict fatigue crack growth lives under random loading. The following approaches are discussed in detail: a root-mean-square approach, a crack-closure model, a multi-parameter yield zone model, and a load-interaction model. V.L.

A82-20509 * **A crack-closure model for predicting fatigue crack growth under aircraft spectrum loading.** J. C. Newman, Jr. (NASA, Langley Research Center, Hampton, VA). In: Methods and models for predicting fatigue crack growth under random loading. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 53-84. 20 refs.

The present paper is concerned with the development and application of an analytical model of cyclic crack growth that includes the effects of crack closure. The model was based on a concept like the Dugdale model, but was modified to leave plastically deformed material in the wake of the advancing crack tip. The model was used to correlate crack growth rates under constant-amplitude loading and to predict crack growth under aircraft spectrum loading on 2219-T851 aluminum alloy plate material. The predicted crack growth lives agreed well with experimental data. The ratio of predicted-to-experimental lives ranged from 0.66 to 1.48. (Author)

A82-20510 * **Multi-parameter yield zone model for predicting spectrum crack growth.** W. S. Johnson (NASA, Langley Research Center, Hampton, VA). In: Methods and models for predicting fatigue crack growth under random loading. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 85-102. 24 refs.

A phenomenological load interaction model referred to as the Multi-Parameter Yield Zone model is presented which accounts for crack growth retardation caused by previous overloads, acceleration due to current overloads, and underload effects. In the present model, load interaction effects are calculated utilizing a residual stress intensity concept. Crack growth retardation and acceleration are accounted for by decreasing or increasing, respectively, the effective stress ratio used in a modified Forman's (1967) crack growth equation. Results of spectrum crack growth predictions for 2219-T851 aluminum are presented. V.L.

A82-20511 **Crack growth behavior of center-cracked panels under random spectrum loading.** J. L. Rudd and R. M. Engle, Jr. (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: Methods and models for predicting fatigue crack growth under random loading. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 103-114. 8 refs.

A study was carried out to assess the validity of using constant-amplitude fatigue crack growth rate data for center-cracked panels to predict the crack growth behavior of center-cracked panels subjected to random flight-by-flight spectrum loading. Analytical/experimental correlations and an evaluation of the sensitivity of the correlations to the overload shut-off ratio and threshold maximum stress-intensity factor used in the analyses are presented. It is concluded that the crack growth behavior of center-cracked panels subjected to random flight-by-flight loading can be accurately predicted from center-cracked panel constant-amplitude fatigue crack growth rate data. V.L.

A82-20512 **Random spectrum fatigue crack life predictions with or without considering load interactions.** J. B. Chang, M. Szamossi, and K.-W. Liu (Rockwell International Corp., North American Aircraft Div., Los Angeles, CA). In: Methods and models for predicting fatigue crack growth under random loading. Philadelphia, PA, American Society for Testing and Materials, 1981, p. 115-132. 14 refs. Contract No. F33615-77-C-3121.

Constant-amplitude fatigue crack growth rate data for 2219-T851 aluminum center-cracked tension specimens have been used to predict fatigue crack lives under random spectrum loading with and without considering load interaction. When the load interaction effects are not considered, the predictions are shown to be conservative for those spectra consisting of predominant tensile overload cycles, whereas for spectra consisting of predominant tension-compression cycles, unconservative predictions will result. A range-pair counting procedure that properly counts the cycles in a random spectrum improves crack growth predictions. The crack growth analysis methodology and computation procedures are discussed in detail. V.L.

A82-20513 **Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981.** Symposium sponsored by the Royal Aeronautical Society. London, Royal Aeronautical Society, 1981. 77 p.

Topics discussed include design possibilities for improved fuel efficiency of civil transport aircraft, energy management in military combat aircraft, and the control of aircraft gas turbines for fuel economy. Particular attention is given to the impact of increasing cost upon the design of avionic fuel management systems and the operational and performance aspects of fuel management in civil aircraft. Consideration is also given to the FS2 Bedford Civil Flight Research Program as well as current and future developments in thrust management. J.F.

A82-20514 **Design possibilities for improved fuel efficiency of civil transport aircraft.** D. H. Jagger (Airbus Industrie, Blagnac, Haute-Garonne, France). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 9 p.

The possible application and potential benefits of various technical advances in aerodynamics, structures, and propulsion for the reduction of fuel usage in future Airbus aircraft are discussed. In particular, technical comparisons and tradeoffs in terms of fuel economy are considered for a hypothetical medium-range project aircraft of the 1980's. Improvements in fuel used per passenger at 1,000 n.m. range over two successive periods of 20 years are estimated. A breakdown of the objectives, time-scales, and costs of of a turbine blade, were preheated and cooled by jets from different impingement tubes at various flow rates and distances. The lumped capacity method was used to determine the cooling rate of the aluminum specimen. The mean heat transfer coefficients were calculated and correlated with dimensionless parameters. The results of the Nusselt numbers obtained from experiments were consistent with those calculated from the recommended formula. Furthermore, these results were compared with the correlations of Metzger and those of Ravuni and Tabakoff, and it was concluded that the formula proposed by this paper was more reasonable. (Author)

A82-20515 **Energy management in military combat aircraft.** J. W. Lyons (British Aerospace Public, Ltd., Co., Aircraft Group, Brough, Humberside, England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 6 p. 5 refs.

Energy management is important not only for fuel economy, but for efficient three-dimensional maneuvering capabilities as well. The principles of several new techniques for energy efficient three-dimensional maneuvers in combat aircraft are discussed. Efficient turbofan engines have been adopted which are electronically controlled for achieving precise thrust settings within engine limits. Engine bleed can be better controlled, and hydraulic pressure control, resulting in reduced mechanical offtakes from the engine, is now possible using microprocessors. Self-healing systems can be used in the battlefield scenario, and advanced display concepts are being employed to make better use of available maneuver energy. These techniques individually result in greater efficiency, but together they provide significant synergistic improvements. J.F.

A82-20516 **The control of aircraft gas turbines for fuel economy.** D. J. Lee (Rolls-Royce, Ltd., Bristol, England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 7 p.

Electronic controls are important to the fuel efficient aircraft of the future as sophisticated fly by wire controls, flight management systems, and complex ATC navigation systems. The functions obtainable using electronic controls are often more complex and more flexible than those produced with hydromechanical systems. They provide greater accuracy in staying within temperature and stress limitations, as well as increased fuel economy. Electronic engine control is also very cost effective over the life of the unit and has the benefit of reducing the pilot workload. Microprocessors have made the use of digital technology for engine control more popular; the benefits of digital control may be seen in terms of improved accuracy, fault diagnostics and tolerance, fuel-type variations, system complexity, and airframe integration. Finally, engine health monitoring systems are used for the programmed maintenance of mechanical parts of gas turbines. J.F.

A82-20517 **The impact of increasing energy costs upon the design philosophy of avionic fuel management systems.** P. R. Thrift (Smiths Industries Aerospace and Defence Systems Co., London, England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 9 p.

Parameters of fuel quantity remaining and rate-of-usage are determinate factors in the operational range of any aircraft. Methods for designing engines with lower fuel consumption, and airframes with lower drag coefficients to minimize the mass of fuel to be carried are being investigated. Operating costs may be reduced by using unused portions of fuel as dynamic balast to control the center of gravity throughout a flight profile. Fuel consumption can also be reduced by control of the aircraft's complete flight envelope. Strategies for measuring fuel mass and determining fuel density are discussed. Means of improving the twin concentric circular cross section transducers are discussed, and the production of a fault tolerant system by the incorporation of two computer systems is described. Finally, the use of microprocessors to control the center of gravity and to detect fuel leaks is discussed. J.F.

A82-20518 **Operational and performance aspects of fuel management in civil aircraft.** H. P. K. Dibley (British Airways, Meeting, 36th, Monterey, CA, June 23-26, 1980, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 11-16.

The Global Positioning System Evaluator (GPSE) is a test facility for GPSE user equipment which presents the user with the RF signals, inertial measurement, and barometric altimeter data it would sense in a wide range of environments. Testing in the GPSE environment exhibits several advantages over flight testing. In addition to the obvious cost benefits and repeatability of simulator testing, the GPSE can simulate a wide range of dynamics (up to 2100 m/s velocity, 30 g acceleration) and simulates a full 24-satellite configuration (a satellite-selection algorithm is used to choose optimum satellite geometries), allowing real-time segments of up to 10 hours duration. This paper describes GPSE model implementation and presents the system performance characteristics. B.J.

A82-21589 # **A perspective on civil use of GPS.** W. C. Euler (Magnavox Advanced Products and Systems Co., Torrance, CA). In: Institute of Navigation, Annual Meeting, 36th, Monterey, CA, June 23-26, 1980, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 33-39. 19 refs.

It is noted that, while the GPS development program has made remarkable progress, the case for civilian users has advanced only marginally. The absence of a concrete policy regarding access, accuracy, and user charges has resulted in conservatism on the part of the affected government agencies as well as industry. It is suggested that the development of a firm national policy for the civil use of Navstar is essential to optimize the planning and equipment evolution to be carried out by affected government agencies, civil users, and equipment manufacturers. B.J.

A82-21590 # **The application of strapdown inertial technology to Attitude and Heading Reference System requirements.** G. W. Gilster (Litton Industries, Guidance and Control Systems Div., Woodland Hills, CA). In: Institute of Navigation, Annual Meeting, 36th, Monterey, CA, June 23-26, 1980, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 48-56.

The LR-80 AHRS (Attitude and Heading Reference System) for the YAH-64 advanced attack helicopter is described. The LR-80 offers a unique AHRS solution in that it employs a strapdown inertial navigation mechanization and provides 'dynamically exact' measurement of vehicle maneuvers. A competitive system cost is achieved by the use of automatic self-calibration techniques, Doppler damping, and application of the inherent virtues of a strapdown mechanization which minimizes electromechanical complexity. The system configuration and design features are described, and flight test results for representative helicopter mission conditions are presented, showing the combined Doppler/AHRS navigation results obtained. Also considered are other potential applications for the system, including missiles and other aircraft, and the flexibility for integration with other navigation aids. B.J.

A82-21591 # **The emerging need for improved helicopter navigation.** N. T. Fujisaki (FAA, Washington, DC). In: Institute of Navigation, Annual Meeting, 36th, Monterey, CA, June 23-26, 1980, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 57-64. 6 refs.

The paper reviews significant helicopter trends and the new complexion of resultant navigation requirements. Programs aimed at immediate problems are considered along with long-term plans to improve helicopter navigation. The essential elements of the FAA helicopter R&D effort are described, and potential areas for future work are also considered (including integrated cockpit system development). B.J.

A82-21592 # **Helicopters and Navstar/GPS.** G. A. Gilbert (Glen A. Gilbert and Associates, Inc., Washington, DC). In: Institute of Navigation, Annual Meeting, 36th, Monterey, CA, June 23-26, 1980, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 65-70.

The elements of an ideal helicopter navigation system are described and evaluated in relation to GPS. Proposed system architecture is presented and principal elements are discussed; and a concept validation program is outlined. This program could lead into an advanced (fourth generation) air traffic control system which would serve not only helicopters but all civil aviation together with military aircraft in the common NAS. Transition to this system would begin in the mid 1980's, with full operational capability in place by the mid 1990's. B.J.

A82-21593 # **Systems approach to the design of wind shear avionics.** N. J. Cafarelli (Automation Industries, Inc., Wheaton, MD) and J. P. McVicker (FAA, Systems Research and Development Service, Washington, DC). In: Institute of Navigation, Annual Meeting, 36th, Monterey, CA, June 23-26, 1980, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 99-103.

The FAA Wind Shear Program Office has completed an analytical investigation of the wind shear phenomenon, with emphasis on threat definition and the detection and avoidance of atmospheric anomalies. This paper summarizes some of these activities and suggests relevant information categories that should be considered in the design of a wind shear avionics system. These categories are: (1) predictive information, which defines specific characteristics and magnitude of an atmospheric anomaly prior to penetration; (2) anticipatory information, which establishes the existence of an atmospheric anomaly prior to penetration, but does not define its characteristics; and (3) reactive information, which defines the characteristics and magnitude of an atmospheric anomaly during penetration. The advantages and limitations of each information category are considered, along with some representative implementations. B.J.

A82-21597 **The case for helicopter hoisting.** W. J. Maddox, Jr. (Arabian Helicopters, Ltd., Dhahran, Saudi Arabia). *Vertiflite,* vol. 28, Jan.-Feb. 1982, p. 16-19.

Helicopter crew training and operations for hoisting personnel while hovering over offshore oilfields and over tankers, and for personnel transport to and from work in the Persian Gulf area are described. Personnel hoisting by commercial helicopters is noted to be illegal in the U.S., while oil company helicopter crews receive training for such operations in Louisiana. A 15-ft clear zone is needed for off-the-deck hoisting when landing cannot be achieved, and most work done in the Near East zone comprises delivery of harbor pilots to their craft. The pilot nominally approaches from the upwind side of a ship or platform to provide a safety margin in case of a power-out condition, and flights are limited to two passengers. Improvements are suggested for better ship identification lights and better lighted landing and hoist areas. M.S.K.

A82-21629 † **Studies on the stability of thin-walled shells with cutouts /Review/. I (Ob issledovaniiakh ustoichivosti tonkostennykh obolochek s vyrezami /Obzor/. I).** I. N. Preobrazhenskii. *Problemy Prochnosti,* Jan. 1982, p. 21-32. 50 refs. In Russian.

A82-21636 † **Dispersion and temperature-force dependence of the high-temperature strength characteristics of a gas-turbine-engine disk alloy (Dispersiia i temperaturno-silovaia zavisimost' kharakteristik zharoprochnosti splava dlia diskov GTD).** E. P. Golubovskii, I. P. Bulygin, and F. V. Iushakova. *Problemy Prochnosti,* Jan. 1982, p. 68-73. In Russian.

Experimental data are presented on the time-to-failure dispersion (under uniaxial tension and under stress concentration), long-term plasticity, and time of accumulation of a specified amount of creep strain (0.2 and 0.5%) for disk alloy EP109VD. It is shown that the dispersion of high-temperature strength characteristics changes in accordance with the vibration decay law as the time to failure increases. Empirical equations are derived which can be used to calculate the bounds of long-term strength, long-term plasticity, and creep for given fracture probabilities. V.L.

A82-21848 **Very high speed integrated circuits: Into the second generation. II - Entering Phase 1.** J. Martin (National Semiconductor Corp., Santa Clara, CA). *Military Electronics/Countermeasures,* vol. 8, Jan. 1982, p. 60-63, 65, 66.

The intended applications of the Very High Speed Integrated Circuits (VHSIC) chips and technologies fall into four basic categories. These categories are related to current operational systems which could be improved through VHSIC technologies without change in performance, the addition of new performance features to existing systems, planned upgrades of existing systems through the use of VHSIC technologies, and new systems which could not be developed without the use of VHSIC technology. Attention is given to system design evolution, aspects of technology insertion, advantages related to standardization, applications related to the development of the next generation Advance Tactical Fighter aircraft, the improvement of reliability, and technology transfer issues. G.R.

A82-21897 **Process monitor helps make jet engines reliable.** *Materials Evaluation*, vol. 40, Feb. 1982, p. 159, 160.

A microprocessor-controlled general-purpose process monitor has been developed for automatic testing of jet engine components, in particular wheels or disks of compressors and turbines from 10 to 30 inches in diameter, at speeds up to 60,000 rpm. Load-cycle fatigue-life tests are performed in six spin pits and are automatically controlled within a range defined by low-speed and high-speed setpoints set by the operator. A complete cycle, from low speed to high speed and back to low, may be completed in less than a minute for a small part and in up to 5 min for a large one. V.L.

A82-21900 **Low-frequency eddy current inspection of aircraft structure.** D. J. Hagemaier and A. P. Steinberg (Douglas Aircraft Co., Long Beach, CA). *Materials Evaluation*, vol. 40, Feb. 1982, p. 206-210. 5 refs.

Low-frequency eddy-current inspection is used to detect fatigue cracks emanating from fastener holes in a wing spar cap and shear-lip in thin multiple-layered structures. It is shown that the technique is useful for detecting subsurface cracks in aluminum structures up to 8.9 mm thick at 100 Hz. The low-frequency eddy current method is also shown to be capable of detecting cracks that are not detectable by X-ray radiography, in particular, shear-lip cracks oriented at 45 deg to the X-ray beam. V.L.

A82-21941 # **Analytical control law for desirable aircraft lateral handling qualities.** H. Ohta (Nagoya University, Nagoya, Japan), P. N. Nikiforuk, and M. M. Gupta (Saskatchewan, University, Saskatoon, Canada). *Journal of Guidance, Control and Dynamics*, vol. 5, Jan.-Feb. 1982, p. 79-85. 8 refs. Natural Sciences and Engineering Research Council of Canada Grants No. A-5625; No. A-1080.

A model-matching technique is used to synthesize a control law which augments the lateral dynamics of an aircraft. The feedback and feedforward gains are derived in terms of the lateral stability derivatives and the control law is designed to satisfy specified lateral handling criteria. The augmented plant has specified lateral characteristic poles and a decoupled transfer function matrix between the aileron and rudder angles as inputs and the bank and sideslip angles as outputs. Approximate relationships are derived between the basic and augmented stability derivatives and presented in tabular form. The feedback gains are determined using the augmented derivatives. Simulation examples for three different flight conditions of a STOL aircraft are given to illustrate and substantiate the effectiveness of the control law. (Author)

A82-22027 # **FAA/NWS aviation route forecast /ARF/ development.** T. R. Mitchell (Mitre Corp., McLean, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0013*. 10 p. 15 refs.

It has been recommended that greater emphasis be placed on the mass dissemination of aviation weather data, because a study of such data is important in planning a safe, expeditious flight. An approach which can provide such a mass dissemination of weather data on a cost-effective basis is considered. According to this approach, pilots could partially 'brief themselves' by directly accessing a computer data base of geographically-retrievable weather messages. Access would be by Direct User Access Terminals (DUAT's) or, alternatively, by using Touchtone telephone tones for providing input to the system and a Voice Response System (VRS) for output. To demonstrate the concepts and resolve the uncertainties, a prototype development program was undertaken. A real-time textual aviation weather data base and DUAT retrieval capabilities were developed on a network of minicomputers. Attention is given to the need for aviation route forecasts (ARF) and aspects of ARF development. G.R.

A82-22028 # **A perspective of computational aerodynamics from the viewpoint of airplane design applications.** L. R. Miranda (Lockheed-California Co., Computational Aerodynamics Dept., Burbank, CA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0018*. 18 p. 56 refs.

A survey of the use of computational aerodynamics as a tool for airplane design is presented. Some general characteristics and requirements of the airplane design process are discussed and particular attention is given to those computer code characteristics that will enhance the effectiveness of computational aerodynamics. The various elements that are needed in a computer code in order to numerically simulate flows for practical applications are identified. The nature of each one of these elements and how it is impacted by considerations of effectiveness are discussed. The most commonly used approaches are reviewed and to what degree they are able to meet the needs of the airplane designer is pointed out. Problem areas are highlighted; present efforts to solve these problems are examined and, in some cases, alternative approaches are indicated. (Author)

A82-22045 * # **Recent advances in applying Free Vortex Sheet theory to the estimation of vortex flow aerodynamics.** J. M. Luckring, W. E. Schoonover, Jr., and N. T. Frink (NASA, Langley Research Center, Transonic Aerodynamics Div., Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0095*. 18 p. 33 refs.

Free Vortex Sheet theory has been applied to a variety of configurations for the estimation of three-dimensional pressure distributions for wings developing separation-induced leading-edge vortex flows. Correlations with experiment show reasonable estimates for the effects of compressibility, side-slip, side edges, swept-wing blast-induced loads, and leading-edge vortex flaps. Theoretical studies expand upon these correlations to show general aerodynamic trends. Consideration is also given to simple, yet effective techniques which expedite convergence and therefore reduce computational expense. (Author)

A82-22046 # **Wing-canard aerodynamics at transonic speeds - Fundamental considerations on minimum drag spanloads.** W. H. Mason (Grumman Aerospace Corp., Bethpage, NY). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0097*. 10 p. 30 refs. Research supported by the Grumman Aerospace Corp.

Current methods for drag minimization minimize only the induced drag portion of the total drag. For many advanced supersonic aircraft, these methods are not valid when considering the transonic maneuver case. This paper describes an approximate method which extends the drag minimization schemes to include transonic wave drag and viscous drag, and then demonstrates the importance of these contributions when performing aerodynamic design at transonic maneuvering conditions. Typical results show both a reduction in total drag and a shift in the minimum drag center of gravity when these additional drag sources are included in the analysis. Another important consideration in canard-wing design is the canard wake modeling choice. In the second section of the paper, the results of two model problems provide a quantitative measure of the potential errors arising from various wake models. (Author)

Johnson, Jr. (Kentron Technical Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0129*. 10 p. 7 refs. NASA-supported research.

A 'pylon vortex generator' concept has been proposed for alleviating the subsonic pitch-up instability of highly swept supersonic-cruise wings. Fixed at a part-span location, this leading-edge device utilizes the lateral velocity component in the flow approaching the swept leading edge to generate a streamwise vortex, Distributed processing and its application to avionic systems are discussed.

THE EFFECT OF INCREASINGLY MORE COMPLEX AIRCRAFT AND AVIONICS ON THE METHOD OF SYSTEM DESIGN
J. T. Martin *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 5 p

Avail: NTIS HC A18/MF A01

The evolution of aircraft and their associated avionics is described. The evolutionary progress is considered as starting from a simple low speed aircraft with rudimentary flight instruments and sighting systems, through the interconnection of some of these systems and progressing to recent avionic systems with centralized digital computing. It is shown how the changes in aircraft systems, from the simple analog connection of a few systems, through the analog sensor/interface box/centralized digital system, to the sensor producing digital outputs/interface box/centralized digital system, have produced comparatively small changes in the methodology used for the design of these systems. The move to systems containing distributed processing interconnected by digital highways is shown to be revolutionary rather than evolutionary and to require a new approach to the system design problem so as to reap the maximum advantage from the available computing capability. A TUTORIAL ON DISTRIBUTED PROCESSING IN AIRCRAFT/AVIONICS APPLICATIONS
Bernard A. Zempolich *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 11 p

Avail: NTIS HC A18/MF A01

An overview of the state of the art in real time distributed processing as applied to aircraft/avionics is presented. Definitions and concepts are presented starting with the total aircraft as a real time distributed computer-controlled system. The relationship of aircraft mission and avionic system architectures is discussed. Overall system architectural considerations are identified and their impact upon a real time distributed computer-controlled system is detailed. A top-down hierarchical, architectural structure is presented. This top-down structuring is described in terms of the logical functional decomposition of the system as follows: total aircraft/avionic system partitioning of aircraft/avionic subsystems, interconnect bus structure (network), system-wide processing architecture, subsystems definition, and computer systems. FUNCTIONAL VERSUS COMMUNICATION STRUCTURES IN MODERN AVIONIC SYSTEMS
K. Brammer and A. Weimann *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 11 p refs

Avail: NTIS HC A18/MF 01

The implications of the increase in functional and communication interfaces on avionic system structures are analyzed. Especially the passage from functional design to implemented communication structure of the airborne electronic system is scrutinized. The distributed organization of an avionic system, the realization of which is greatly simplified by bus type intrasystem signal transmission, is compared to the conventional hierarchical system organization. Advantages and drawbacks of both organizations are reviewed especially with respect to interface efficiency, cabling requirements, and the typical topology of avionic systems. J.D.H.

ECONOMIC CONSIDERATIONS FOR REAL-TIME NAVAL AIRCRAFT/AVIONICS DISTRIBUTED COMPUTER CONTROL SYSTEMS
Bernard A. Zempolich *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 10 p

Avail: NTIS HC A18/MF A01

Economic considerations for Distributed Computer Control Systems (DCCS) are discussed. Centralized, distributed and federated processing architectures are used as the primary set of systems alternatives from which economic factors are developed. The economic impact of subsequent logistic support for standardized computer hardware and software versus non-standard products is identified. System considerations such as reliability, maintainability, availability, built-in-test, fault tolerance, and redundancy are examined from the standpoint of resources available to design and develop the DCCS, and also from the viewpoint of economic impact of failure of the DCCS to perform as expected. The economic impact of external factors such as the rate of technology advancement, technology independence, limited production runs, and the general lack of economic leverage upon the market are examined and related to the life-cycle support requirements of the DCCS. STAGE-STATE RELIABILITY ANALYSIS TECHNIQUE
Alan D. Stern *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 7 p refs

Avail: NTIS HC A18/MF A01

An advanced flight control system reliability analysis technique must properly account for the defined success criteria, redundancy level, redundancy management, technique, system dependencies, and failure detection coverage. The stage state reliability analysis technique properly accounts for these factors. It is also computationally simple such that triplex redundant systems have been analyzed using an early 1970's desktop computer. This method is well suited for analysis by the system architect. The process begins with a system block diagram showing all element connections. A success logic diagram is then written reflecting all possible success states. The probability of success equation is written directly from the logic diagram and evaluated by substituting the probability expression for each system element. Multiple success criteria can be applied to one problem formulation simply by deleting those states which do not satisfy the success criterion. Author

METHODOLOGY FOR MEASUREMENT OF FAULT LATENCY IN A DIGITAL AVIONIC MINIPROCESSOR
John C. McGough, Fred Swern, and Salvatore J. Bavuso *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 18 p refs Prepared in cooperation with Bendix Corp., Teterboro, N.J.

(Contract NAS1-15946)
Avail: NTIS HC A18/MF A01 CSCL 01D

Using a gate level emulation of a typical avionics miniprocessor, fault injection experiments were performed to (1) determine the time to detect a fault by comparison monitoring, (2) forecast a program's ability to detect faults and (3) validate the fault detection coverage of a typical self test program. To estimate time to detect, six programs ranging in complexity from 6 to 147 instructions, were emulated. Each program was executed repetitively in the presence of a single stuck at fault at a gate node or device pin. Detection was assumed to occur whenever the computed outputs differed from the corresponding outputs of the same program executed in a nonfaulted processor. Histograms of faults detected versus number of repetitions to detection were tabulated. Using a simple model of fault detection, which was based in an analog with the selection of balls in an urn, distributions of time to detect were computed and compared

with those obtained empirically. A self test program of 2,000 executable instructions was designed expressly for the study. The only requirement imposed on the design was that it should achieve 95% coverage. The program was executed in the presence of a single stuck-at fault at a gate node on device pin. The proportion of detected faults are tabulated. In all experiments faults were selected at random over gate nodes or device pins.

HIERARCHICAL SPECIFICATION OF THE SIFT FAULT TOLERANT FLIGHT CONTROL SYSTEM

P. M. Melliar-Smith and Richard L. Schwartz *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 15 p refs
(Contract NAS1-15428)
Avail: NTIS HC A18/MF A01 CSCL 01B

The specification and mechanical verification of the Software Implemented Fault Tolerance (SIFT) flight control system is described. The methodology employed in the verification effort is discussed, and a description of the hierarchical models of the SIFT system is given. To meet the objective of NASA for the reliability of safety critical flight control systems, the SIFT computer must achieve a reliability well beyond the levels at which reliability can be actually measured. The methodology employed to demonstrate rigorously that the SIFT computer meets as reliability requirements is described. The hierarchy of design specifications from very abstract descriptions of system function down to the actual implementation is explained. The most abstract design specifications can be used to verify that the system functions correctly and with the desired reliability since almost all details of the realization were abstracted out. A succession of lower level models refine these specifications to the level of the actual implementation, and can be used to demonstrate that the implementation has the properties claimed of the abstract design specifications.

RECONFIGURATION: A METHOD TO IMPROVE SYSTEMS REALIABILITY

J. Szlachta *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 8 p

Avail: NTIS HC A18/MF A01

A system with hardware and software reconfiguration capabilities was developed to improve the reliability of a flight-augmentation computer. The system consists of a network of n redundant computers, linked via m serial buses. A two computer processing units and two or more input/output drivers. A fault in one of the components of the redundant computers causes a hardware reconfiguration which replaces the faulty component by its still functioning twin. If a redundant computer fails altogether, all tasks allocated to it are transferred to one of the still working computers of the network. This is made possible by loading dormant copies of the tasks into at least one other computer of the initial system. These dormant copies are periodically supplied with the program status of the active copy.

A RECONFIGURABLE CHANGE NETWORK FOR DISTRIBUTED PROCESS CONTROL [RESEAU D'ECHANGE RECONFIGURABLE POUR CONTROLE DE PROCESSUS REPARTI]

Ch. Meraud and B. Maurel (Societe. Anonyme de Telecommunications) *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 10 p refs In FRENCH

Avail: NTIS HC A18/MF A01

A highly reliable, high output system of change is described which permits decentralized exchange between the diverse equipment onboard an aircraft or other type of vehicle in order to integrate and reconfigure the functions, no matter how critical. Very large scale integration and fiber optics which are insensitive to electromagnetic perturbations made possible a performing decentralized solution by incorporating intelligence in a universal type linking module called the subsystem interface. For the traditionally programmed mechanism for generating change, a dynamic mechanism immediately adapted to modification, is substituted which permits a great degree of synchronization.

NEXT GENERATION MILITARY AIRCRAFT WILL REQUIRE HIERARCHICAL/MULTILEVEL INFORMATION TRANSFER SYSTEMS

James W. McCuen *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 8 p refs

Avail: NTIS HC A18/MF A01

Changes in avionic subsystems and mission roles of next generation aircraft require new concepts in data transfer. New aircraft need total airframe/weapon system integration which means new approaches must be developed for the interconnection of avionic subsystems. Effort has begun to develop a Military Standard (MIL-STD) which will define the requirements for a high speed data bus network. The standard shall characterize a higher order information transfer system (ITS) that will interconnect avionic systems, that contain their own multiplex ITS, into a fully integrated data complex. The higher order ITS shall employ an operational protocol that will provide subsystems and common sensors, independence and fault isolation by distributed control of the common data bus.

SIFT: AN ULTRA-RELIABLE AVIONIC COMPUTING SYSTEM

Kurt Moses *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 10 p

Avail: NTIS HC A18/MF A01

Software implemented fault tolerance (SIFT) is an ultra-reliable computing system which is based on a multiprocessor architecture that achieves fault tolerance by replicating computing tasks among processing units. Error detection and system configuration are performed by software to maintain the operational integrity of the computing system. The high speed inter-computer communication system required for operation realized by dedicated serial links arrayed in a star connection. Software algorithms are used for failure detection by means of voting, failure isolation to the faulty processor, and reconfiguration after fault detection. Frame synchronization between processors is employed to reduce data skew and minimize false alarms. The architecture of SIFT, its hardware implementation, and the test stand used for evaluation. Potential applications of this technique to current and anticipated ultra-reliable electrical flight control systems are given.

Several new concepts for multiple instrument approaches have been proposed to improve capacity and reduce delays at U.S. airports. The concepts include: dependent parallel approaches at reduced runway spacing; independent parallel approaches at reduced runway spacing; converging approaches; and triple approaches. One of the runways involved may be a separate short runway for general aviation and commuter traffic. A survey of 101 top U.S. airports was performed to determine the potential for applying the concepts to the existing runways. Specific applications of each relevant concept are provided. Calculations were performed for the top 30 U.S. air carrier airports to determine the actual delay improvement which could be expected to result from application of the multiple-approach concepts. Additionally, some general results are obtained for the remaining 71 airports.

MECHANISMS OF CORROSION FATIGUE
D. J. Duquette *In* AGARD Corrosion Fatigue Oct. 1981 12 p refs Sponsored in part by Office of Naval Research

Avail: NTIS HC A05/MF A01

An overview of experimental variables which are considered critical to understanding the mechanisms of corrosion fatigue of high strength aluminum alloys is presented. Based on this overview, an examination of previously proposed mechanisms is attempted. These models include anodic dissolution, surface energy reduction, and hydrogen embrittlement. It is concluded that hydrogen embrittlement of process zones at alloy surfaces (for crack initiation) and at crack tips (for crack propagation) best explains observed results. A general model of corrosion fatigue of these alloys is proposed. This model suggests that the nature of the naturally formed oxide film on aluminum alloys may be a critical factor. Chemical or mechanical damage of the film allows hydrogen ingress. The presence of second phase particles which may act as sinks for dislocation transported hydrogen, may also be a necessary prerequisite to significant amounts of reduction in fatigue resistance associated with corrosion.

FRACTURE MECHANICS BASED MODELLING OF THE CORROSION FATIGUE PROCESS
David W. Hoeppner, Douglas Mann, and J. Weeks *In* AGARD Corrosion Fatigue Oct. 1982 17 p refs Sponsored in part by NSERC and Dept. of Energy, Mines and Resources of Canada

Avail: NTIS HC A05/MF A01

Corrosion fatigue of structural elements involves a synergism between cyclic load and a chemical environment involving both time and temperature as rate-controlling parameters. The development of rational life prediction methods is hampered by both the lack of mechanistic understanding, the large number of corrosion-fatigue synergisms, and the inadequacies of fracture mechanics based models in both pre mode I fatigue cracking and initial mode I cracking. Aspects of mechanisms related to the formulation of corrosion fatigue life prediction models are discussed in relation to micromechanical modelling based on fracture mechanics. Emphasis was placed on the formation of mode I fatigue cracks from pits, and fretting surface damage. A discussion of the needs in this area is presented. It is believed that with further analytical and experimental information the models presented can be verified and provide useful guidance to engineers and scientists attempting to deal with corrosion and fretting fatigue.

CORROSION FATIGUE BEHAVIOUR OF SOME ALUMINIUM ALLOYS
D. Aliaga and E. Budillon *In* AGARD Corrosion Fatigue Oct. 1981 12 p
Avail: NTIS HC A05/MF A01

An evaluation of corrosion fatigue strength of aluminum alloys currently used in the aeronautical industry was made. Crack propagation was evaluated in various different environments (dry argon, wet air, salt water). The effect of frequency, of test specimen thickness, and of ratio R (R = Kmin/Kmax) were investigated. And the effect of these various environments on the endurance limit of 10 to the 7th power cycles was likewise studied and some surface protections evaluated. The intent of the survey was to compare the response in fatigue of various aluminum alloys used in the aeronautical construction. The environments studied were the following: dry argon, wet air and salt-water. They were retained so as to simulate and amplify the more or less aggressive nature of these environments in which aircraft can find themselves both on the ground or in the air. The two major aspects of corrosion fatigue namely crack initiation and crack propagation were studied with an emphasis on in-service behaviour. As far as crack initiation is concerned some surface treatments and protections currently used in aeronautics were examined in various environmental conditions.

FLIGHT-BY-FLIGHT CORROSION FATIGUE TESTS
Walter Schuetz *In* AGARD Corrosion Fatigue Oct. 1981 10 p refs
Avail: NTIS HC A05/MF A01

Corrosion fatigue tests should be conducted under realistic load sequences especially for tests with riveted specimens because the rare high loads of the spectrum may loosen the fasteners, damaging the corrosion protection system and therefore rendering it ineffective. Possibly this does not happen in constant amplitude tests because the loads may not be high enough to crack the protection system. This was the reasoning behind the test program carried out with flight-by-flight tests. Tests were carried out with two aluminum alloys typical for use in modern and in faying aircraft respectively, namely 7475-T 761 and 7075-T6. The sheet materials were exchanged between two laboratories so that both would use materials of the same heats. The specimens used differed, however, in the corrosion protection systems and in the manufacturing of the specimens by different firms. A project status report is made. M.D.K.

US NAVAL FLEET AIRCRAFT CORROSION
G. T. Browne *In* AGARD Aircraft Corrosion Aug. 1981 15 p

Avail: NTIS HC A09/MF A01

Water entry and its associated corrosion problems were minimized. A method for sealing environmental connectors without degrading wire quick disconnect capability was incorporated by sealing the back connector shell rubber grommet with clear room temperature vulcanizing silicone type sealant. The screw holes and equipment lids were also sealed in a similar manner. Drain holes were located and drilled in nonstructural areas at low points to remove trapped water and eliminate the corrosive agents. Hidden corrosion was detected by nondestructive inspection methods during rework. These include ultrasonic, X-ray and eddy current inspection and neutron radiography on double skin areas and on areas behind stringers, etc., where corrosion is caused by moisture entrapment. Stress corrosion cracking in high strength components was discovered occasionally. Standard fleet corrosion maintenance is accomplished in accordance with procedures provided in technical manuals. Paint and corrosion removal procedures and tools are discussed. N.W.

AN AIRLINE VIEW OF THE CORROSION PROBLEM
R. G. Mitchell *In* AGARD Aircraft Corrosion Aug. 1981 11 p

Avail: NTIS HC A09/MF A01

Although the corrosion phenomenon is well understood by aircraft manufacturers and operators alike, most current aircraft types continue to exhibit many of the fundamental corrosion defects shown by earlier designs. It is estimated that the total annual cost to IATA member airlines is around $100 million based on 1978 operations. Environmental and maintenance effects are important and should be fully understood in their importance in minimizing corrosive attack. In addition to the more common forms, filiform corrosion and microbiological contamination present hazards to aircraft operating in certain areas of the world. Temporary water displacing fluids are becoming common in their use, and subject to certain limitations are providing valuable short term protection. The FAA design rules require the effects of corrosion to be considered at the design stage which should result in an improved product for the operator. In addition the IATA document Guidance Material on Design and Maintenance Against Corrosion of Aircraft Structures specifies practices which should also improve the overall product. Author

SOME OBSERVATIONS ON THE CORROSION OF AIRCRAFT AT THE AIR FORCE BASE IN BANDIRMA, TURKEY
M. Doruk *In* AGARD Aircraft Corrosion Aug. 1981 8 p

Avail: NTIS HC A09/MF A01

The types and the causes of corrosion which have been observed primarily on aircraft of Type F-5A in Turkey are studied. Visual inspection showed many locations of concentration of corrosion. The vertical stabilizer attach angle (alloy 7075-T6) fails through exfoliation corrosion and galvanic attack in the bolt holes. Galvanic corrosion has also been observed around the jaw bolts under the main wings. Another case of exfoliation attack has been found on the uplock support rib (Alloy 7075-T6 or 7079-T6) in the main landing gear well. Damage in the honeycomb assembly which appears as a debonding between the honeycomb structure and the top plate has been regarded as a serious problem. Corrosion damage is attributed to the high corrosiveness of the atmosphere of Air Force Base laden with sea salt and polluted from industries in the neighborhood. Author

THE EXPERIENCE OF CORROSION ON FRENCH MILITARY AERODYNES [L'EXPERIENCE DE LA CORROSION SUR AERODYNES MILITAIRES FRANCAIS]
Melle M. Huret *In* AGARD Aircraft Corrosion Aug. 1981 9 p In FRENCH
Avail: NTIS HC A09/MF A01

Several examples of corrosion occurring in French military aircraft in detail, e.g., honeycomb sections and metal-to-metal adhesively bonded structures were described. Information about the various measures which were taken to diminish the problem was given. The manufacturing specifications do not take care of all protection requirements. Furthermore, the paint systems which are applied are not the best available, or they have been applied in the wrong way. Bad sealing also occurs frequently. Other preventive measures, e.g., water displacing fluids, can given additional, short term, protection. N.W.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 512 reports, journal articles, and other documents originally announced in April 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

angle-of-attack range. The most significant feature of the fighter's flow field is the leading edge vortex that forms at low alphas, grows stronger, and moves inboard as alpha is increased. Upper surface blowing enhanced the lift on the wing in both stalled and unstalled areas significantly, while generating only a modest aft shift in the center of pressure. Lift gains were greatest at high alphas and with the flap deflected. Spanwise blowing was most significant at angles-of-attack greater than 8 deg, when the jet strengthened the vortex. The 1100 F spanwise blowing jet mixed very rapidly with the wing flow field, creating a maximum temperature rise of only 300-350 F. A comparison of small-scale and large-scale model wing pressure characteristics showed similar trends created by upper surface blowing, while spanwise blowing characteristics differed considerably. Force data correlated well with semi-empirical predictions for gross thrust coefficients less than 1.0. J.F.

A82-19208 * # **Large-scale wind tunnel tests of a sting-supported V/STOL fighter model at high angles of attack.** F. Stoll (NASA, Ames Research Center, Helicopter and Powered Lift Technology Div., Moffett Field, CA) and E. A. Minter (Vought Corp., Dallas, TX). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2621*. 12 p. 6 refs.

A new sting model support has been developed for the NASA/Ames 40- by 80-Foot Wind Tunnel. This addition to the facility permits testing of relatively large models to large angles of attack or angles of yaw depending on model orientation. An initial test on the sting is described. This test used a 0.4-scale powered V/STOL model designed for testing at angles of attack to 90 deg and greater. A method for correcting wake blockage was developed and applied to the force and moment data. Samples of this data and results of surface-pressure measurements are presented. (Author)

A82-19209 * # **Quiet Short-Haul Research Aircraft - The first 3 years of flight research.** J. A. Cochrane, D. W. Riddle, and V. C. Stevens (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2625*. 18 p. 9 refs.

NASAs first three years of flight research in an investigation of terminal area flight operation with the Quiet Short-Haul Research Aircraft (QSRA) are presented. An initial flight and modification program was devoted to improving the capabilities of the QSRA and measuring its performance. Later programs included a joint program with the US Navy, a guest pilot program involving 23 pilots from 16 organizations, and a program to measure benefits of propulsive-lift to CTOL aircraft. Development flight research, complemented by the aircraft modification program, has resulted in improvements in the maximum lift coefficient of more than two units, and has greatly improved flight characteristics and handling qualities. D.L.G.

A82-19210 * # **Low speed testing of the inlets designed for a tandem-fan V/STOL nacelle.** R. C. Williams (NASA, Lewis Research Center, Cleveland, OH) and A. H. Ybarra (Vought Corp., Dallas, TX). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2627*. 12 p. 5 refs.

An approximately 0.25 scale model of a tandem fan nacelle, designed for a subsonic V/STOL aircraft, was tested in a Lewis wind tunnel. Model variables included long and short aft inlet cowls and the addition of exterior strakes to the short inlet cowl. Inlet pressure recoveries and distortion were measured at pitch angles to 40 deg and at combinations of pitch and yaw to 30 deg. Airspeeds covered a range to 135 knots (69 m/sec). The short aft inlet with added strakes had the best aerodynamic performance and is considered suitable for the intended V/STOL application. (Author)

A82-19211 * # **Application of thrusting ejectors to tactical aircraft having vertical lift and short-field capability.** D. G. Koenig, F. Stoll, and K. Aoyagi (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2629*. 23 p. 41 refs.

The status of ejector development in terms of application to V/STOL aircraft is reported in three categories: aircraft systems and ejector concepts; ejector performance including prediction techniques and experimental data base available; and, integration of the ejector with complete aircraft configurations. Available prediction techniques are reviewed and performance of three ejector designs with vertical lift capability is summarized. Applications of the 'fuselage' and 'short diffuser' ejectors to fighter aircraft are related to current and planned research programs. Recommendations are listed for effort needed to evaluate installed performance. (Author)

A82-19212 * # **Airframe effects on top-mounted inlet systems for VSTOL fighter aircraft.** D. B. Smeltzer, W. P. Nelms, and T. L. Williams (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2631*. 10 p. 8 refs.

Inlet flow-field and compressor-face performance data were obtained for a 0.095-scale model of a VSTOL fighter-attack aircraft configuration with twin top-mounted inlets. Tests were conducted at Mach numbers from 0.6 to 2.0 and at angles of attack and sideslip up to 27 deg and 12 deg, respectively. The effects of inlet location, wing leading-edge extension planform area, canopy-dorsal integration, and variable incidence canards were determined. The results show that distortion at the compressor face when maneuvering is relatively low (20% or less) at Mach numbers up to 0.9. However, at Mach numbers of 1.2 and above, maneuverability may be restricted because of high distortion or low pressure recovery (80% or less) or both. (Author)

A82-19213 * # **Thrust modulation methods for a subsonic V/STOL aircraft.** R. R. Woollett (NASA, Lewis Research Center, Cleveland, OH). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2633*. 17 p.

Attention is given to four techniques for attaining thrust modulation, namely (1) varying the engine rotational speed; (2) varying the fan nozzle exit area; (3) changing the thrust of the propulsion system by using a variable pitch rotor; and (4) changing the thrust by means of variable inlet guide vanes. The thrust modulation range, thrust level, and blade stresses are examined for each of the thrust modulation systems. Results are shown at the high angles of attack associated with tilt-nacelle V/STOL aircraft. Finally, the interrelationship between the inlet and the thrust modulation system is illustrated for two inlet types. C.R.

A82-19214 * # **Comparison of two parallel/series flow turbofan propulsion concepts for supersonic V/STOL.** R. W. Luidens, G. E. Turney, and J. Allen (NASA, Lewis Research Center, Cleveland, OH). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2637*. 15 p. 5 refs.

The thrust, specific fuel consumption, and relative merits of the tandem fan and the dual reverse flow front fan propulsion systems for a supersonic V/STOL aircraft are discussed. Consideration is given to: fan pressure ratio, fan air burning, and variable core supercharging. The special propulsion system components required are described, namely: the reflecting front inlet/nozzle, the aft subsonic inlet, the reverse pitch fan, the variable core supercharger and the low pressure forward burner. The potential benefits for these unconventional systems are indicated. (Author)

A82-19215 # **VTOL as it applies to resource development in the Canadian north.** R. N. Lightfoot (UMA Group, Edmonton, Alberta, Canada). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2640*. 18 p. 58 refs.

It is pointed out that, for many of the natural resource development projects planned in Canada between now and the end of the century, it may be necessary for the work force to commute to the site by air. Examples of successful operations, including those involving VTOL, are given. A computer program developed for determining the least expensive type of aircraft for commuting to remote projects is described. It is noted that the program can select both fixed-wing and helicopter aircraft types for a specific project, employing such variables as the size and shift schedules of the work force and the commuting distance. Capital and operating costs of existing and proposed aircraft types, as well as groundside infrastructure operations and maintenance costs, are compared for competing aircraft. C.R.

A82-19216 * # **Concept definition and aerodynamic technology studies for single-engine V/STOL fighter/attack aircraft.** W. P. Nelms and D. A. Durston (NASA, Ames Research Center, Aircraft Aerodynamics Branch, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2647.* 28 p. 15 refs.

The results obtained in the early stages of a research program to develop aerodynamic technology for single-engine V/STOL fighter/attack aircraft projected for the post-1990 period are summarized. This program includes industry studies jointly sponsored by NASA and the Navy. Four contractors have identified promising concepts featuring a variety of approaches for providing propulsive lift. Vertical takeoff gross weights range from about 10,000 to 13,600 kg (22,000 to 30,000 lb). The aircraft have supersonic capability, are highly maneuverable, and have significant short takeoff overload capability. The contractors have estimated the aerodynamics and identified aerodynamic uncertainties associated with their concepts. Wind-tunnel research programs will be formulated to investigate these uncertainties. A description of the concepts is emphasized. (Author)

A82-19217 # **Sea based support aircraft alternatives.** R. T. Priestley and A. R. Yackle (Lockheed-California Co., Burbank, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2649.* 10 p. 5 refs.

Multi-mission, CTOL, STOL and V/STOL aircraft concepts were sized for the Navy ASW/ASUW missions and comparatively evaluated. Initially, technology levels in the areas of lift, control systems, propulsion, advanced materials and avionics were established for the early 1990's. The aircraft were compared to determine the impact of multi-mission requirements, operational considerations, chiefly takeoff mode, as well as the technology advancements. Results presented include performance envelopes, weight statements, growth factors, impact of technology on weight reduction and the impact of design constraints. (Author)

A82-19218 # **Design features of a sea-based multipurpose V/STOL, STOVL, and STOL aircraft in a support role for the U.S. Navy.** G. W. Bradfield (General Dynamics Corp., Fort Worth, TX). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2650.* 9 p.

Design features and certain performance data are outlined for three different basic airframes. The heart of the design is a powered lift system known formally as the Advanced Blown Lift Enhancement system. A summary of the results of both powered-model wind tunnel tests of the airplane and of static tests of the vectoring-nozzle system is given to indicate the rather high degree of thrust vectoring efficiency and powered lift enhancement attained. C.R.

A82-19219 # **Application of the ABC helicopter to the emergency medical service role.** L. S. Levine (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2653.* 18 p. 23 refs.

Attention is called to the use of helicopters in transporting the sick and injured to medical facilities. It is noted that the helicopter's speed of response and delivery increases patient survival rates and may reduce the cost of medical care and its burden on society. Among the vehicle characteristics desired for this use are a cruising speed of 200 knots, a single engine hover capability at 10,000 ft, and an absence of a tail rotor. Three designs for helicopters incorporating such new technologies as digital/optical control systems, all composite air-frames, and third-generation airfoils are presented. A sensitivity analysis is conducted to show the effect of design speed, mission radius, and single engine hover capability on vehicle weight, fuel consumption, operating costs, and productivity. C.R.

A82-19220 * # **Analysis of selected VTOL concepts for a civil transportation mission.** S. B. Wilson, III, J. V. Bowles, and J. D. Foster (NASA, Ames Research Center, Moffett Field, CA). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2655.* 19 p. 15 refs.

As part of defining the needs and technology requirements for VTOL aircraft research and development, the objective of this paper is to study the application of two tilt propulsion concept VTOL aircraft to the business/executive transport mission. The two concepts selected for study are the tilt jet concept utilizing rotating turbofan engines for both vertical lift and cruise thrust, and the tilt rotor concept using relatively low disc loading propellers for hover and cruise. Overall mission costs, including the time-value cost of the executives, was computed for a selected range of mission distances, up to the design mission range of 750 nm (1400 km). The total trip cost was also compared to that of a conventional helicopter/business jet combination for a typical executive transport mission. (Author)

A82-19221 * # **A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation.** J. R. Mihaloew (NASA, Lewis Research Center, Cleveland, OH), S. P. Roth, and R. Creekmore (United Technologies Corp., Government Products Div., West Palm Beach, FL). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2663.* 18 p. 6 refs.

A Pegasus-Harrier propulsion system is selected as a baseline for developing mathematical modeling and simulation techniques for VSTOL. Initially, static and dynamic propulsion system characteristics are modeled in detail to form a nonlinear aerothermodynamic digital computer simulation of a Pegasus engine. From this high fidelity simulation, a real-time propulsion model is formulated by applying a piecewise linear state variable methodology. A hydromechanical and water injection control system is also simulated. It is noted that the real-time dynamic model includes the detail and flexibility required for evaluating critical control parameters and propulsion component limits over a limited flight envelope. C.R.

A82-19234 **Utilization of hybrid computational equipment for the simulation of parachute system flight.** W. H. Curry and P. R. Schatzle (Sandia National Laboratory, Albuquerque, NM). In: Summer Computer Simulation Conference, Washington, DC, July 15-17, 1981, Proceedings. Arlington, VA, AFIPS Press, 1981, p. 143-147. 5 refs. Research supported by the U.S. Department of Energy.

Some computational programs which ordinarily would be run on large-scale, all-digital central computing equipment could also be implemented on hybrid computing equipment located in dedicated facilities such as, for example, aerospace flight simulation laboratories. Advantages would be cost-effective use of equipment and, in many cases, shorter run time. A description is presented of the utilization of a hybrid computer for parachute system flight simulation, taking into account some typical results. The described simulations were programmed for hybrid computer facilities which include fully expanded AD/FIVE analog computers interfaced to a PDP11/60 digital computer with a 64-kiloword core and two 2.5 megaword disks. G.R.

A82-19244 **KC-135 avionics modernization hot bench - An evaluation of requirements and design for the future.** S. J. Cristiani (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). In: Summer Computer Simulation Conference, Washington, DC, July 15-17, 1981, Proceedings. Arlington, VA, AFIPS Press, 1981, p. 338-340.

The U.S. Air Force has been extending the operational capabilities and useful life of its KC-135 air refueling fleet through a series of improvements. In order to evaluate various options for avionics system design, projects were initiated with the Directorates of Avionics Engineering (ENA) and Equipment Engineering (ENE). Attention is given to the development of the Avionics Modernization Hot Bench (AMHB). This effort is providing the technical data base for near term KC-135 avionic updates and for charting the long-term roadmap for future updates. The Hot Bench consists of a mix of actual avionics hardware (e.g., computers, displays) and software

Hounslow, Middx., England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 13 p.

In order to carry maximum payload at minimum cost, an airline must find means of optimizing fuel purchasing, pre-flight planning, and in-flight procedures. Accurate forecasting and monitoring of fuel costs is needed to obtain adequate fuel supplies at the best price, to maximize uplift at cheap stations, and to show the effect of outages of uplift stations. Pre-flight planning is used to determine the route for minimum fuel consumption and to calculate the maximum take-off weight. Minimization of fuel consumption during flight can be achieved by (1) presentation of optimum climb, cruise and descent information; (2) flight management systems coupled to the autopilot; (3) optimizing the use of engine climb derate; (4) improving navigational accuracy; (5) presentation of more navigation parameters to the pilot; (6) vertical navigation; and (7) minimizing noise and fuel consumption on approach. J.F.

A82-20519 **The FS2 RAE Bedford civil flight research programme.** R. W. Jones and R. C. Rawlings (Royal Aircraft Establishment, Bedford, England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 11 p. 12 refs.

The RAE/FS2 Bedford Civil Avionics Flight Research Program is aimed at studying the individual component systems for flight control, navigation, display, and flight management and at integrating these systems for optimum air traffic control (ATC). Modern equipment can provide accurate automatic navigation in four dimensions, and electronic displays can improve methods of displaying information to the flight crew as well as improve interaction between pilot/ATC and automatic navigation systems. Radar monitoring will be needed to ensure the meeting of safety standards, and monopulse SSR will provide an improved method of tracking and identifying aircraft. More use will be made of high level stacking to provide the airspace necessary to handle more aircraft and to reduce fuel wastage. The ADSEL/DABS system reduces garbling and provides a suitable data link to pass ATC requirements and wind data to the aircraft as well as aircraft derived parameters to the ATC. J.F.

A82-20520 **Thrust management - Current achievements and future developments.** J. L. Weston (Smiths Industries Aerospace and Defence Systems Co., Cheltenham, Glos., England). In: Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981. London, Royal Aeronautical Society, 1981. 12 p.

A system architecture has been developed to provide a fuel efficient full-flight regime auto-throttle system and a second generation flight management computer system. The auto-throttle system is capable of controlling the engine throttle levers from before take-off until touchdown as well as providing command signals to the aircraft flight director system. The operation modes of the system include take-off, climb, cruise, descent, maximum continuous thrust, hold, approach and go-around. The flight management computer system is responsible for the overall operation of the aircraft between the take-off location and the destination point. Its eight major functions are (1) flight planning; (2) navigation; (3) control of VOR/DME receivers; (4) lateral guidance; (5) vertical path optimization; (6) vertical guidance; (7) look ahead information; and (8) provision of information to support the electronic flight instrument system. J.F.

A82-20521 **Pactec V - Plastics technology advances/1980 update; Proceedings of the Fifth Annual Pacific Technical Conference, Los Angeles, CA, February 26-28, 1980. Volume 3.** Conference sponsored by the Society of Plastics Engineers. Greenwich, CT, Society of Plastics Engineers, Inc.; El Segundo, CA, Technology Conferences, 1981. 257 p. $17.50.

The latest contributions to the scientific and engineering knowledge of plastics are discussed under the headings of reinforced plastics and composites, structural foams, and plastics in building. Papers presented include: conductive prepregs for lightning strike protection of aircraft, fatigue behavior of selected nonwoven fiber composites for helicopter rotor blades, conductive plastics for EMI shielding, recent advances in plastic concrete, and thermoplastics in solar energy. V.L.

A82-20523 **Conductive prepregs for lightning strike protection on aircraft.** G. L. Patz (Hexcel Corp., Dublin, CA). In: Pactec V - Plastics technology advances/1980 update; Proceedings of the Fifth Annual Pacific Technical Conference, Los Angeles, CA, February 26-28, 1980. Volume 3. Greenwich, CT, Society of Plastics Engineers, Inc.; El Segundo, CA, Technology Conferences, 1981, p. 15-22.

A prepreg system has been developed which is capable of dissipating a full 200,000 amp lightning strike. The prepreg system is based on an E-glass fiber which has a continuous uniform coating of pure aluminum chemically bonded to the glass filament. Simulated lightning tests of a series of aircraft-skin-type sandwich panels on which the new prepreg was used as a surface ply over graphite, Kevlar, and glass prepreg systems have shown that the tested material is capable of conducting lightning currents without undue structural damage. Preliminary testing has also shown that there is no appreciable galvanic cell interaction between the outer ply and the graphite substructure. V.L.

A82-20524 **Fatigue behavior of selected non-woven fiber composites for helicopter rotor blades.** J. W. Davis and G. J. Sundsrud (3M Co., Structural Products Dept., St. Paul, MN). In: Pactec V - Plastics technology advances/1980 update; Proceedings of the Fifth Annual Pacific Technical Conference, Los Angeles, CA, February 26-28, 1980. Volume 3. Greenwich, CT, Society of Plastics Engineers, Inc.; El Segundo, CA, Technology Conferences, 1981, p. 23-38.

A number of variables characterizing nonwoven glass-reinforced composites used for propeller and rotor blade structures have been studied in order to determine which of the many raw material variables could contribute to improving the fatigue properties of the composite. The properties investigated included variations in resin, glass type, glass supplier, glass finish, glass monofilament diameter, and fiber bundle size. Both unidirectional and 45-degree orientations were used in tensile fatigue tests. The study has produced a series of thirty-one alternating stress vs cycle to failure curves for the raw material variables investigated. V.L.

A82-20526 **Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981.** Symposium sponsored by the Royal Aeronautical Society. London, Royal Aeronautical Society, 1981. 116 p.

The state-of-the-art in flight simulator trainers is examined, with consideration given to both commercial and military uses of simulators. Training with simulators by the RAF, the French Air Force, and the USAF is explored, and attention is paid to commercial pilot training for airlines and in general aviation aircraft. Specific mention is made of simulators for crew member training for the Nimrod helicopter and for the B-52 bomber. The employment of simulators by aircraft manufacturers is discussed, including the automation of in-flight simulation of data handling and validation testing of the simulator programs. The effects of simulators on advanced aircraft technology is explored, as are advances in simulation, in visual representation technology, and the direction of civil simulation, particularly for the case of satisfying FAA Phase III requirements. M.S.K.

A82-20527 **The simulator and the airline pilot.** G. T. Lavery (British Air Line Pilots Association, Hayes, Middx., England). In: Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981. London, Royal Aeronautical Society, 1981. 6 p.

The purposes, a summary, and future goals of pilot simulator training techniques are reviewed. Simulators eliminate the expense of flying an actual aircraft for many hazardous operating experiences, can be used regardless of weather conditions, allows repetitive exposure to abnormal situations, and allows the instructor to be close-at-hand. Simulators are noted to often lack fidelity in terms of power applications and yaw, magnitude of response to configuration changes and drag changes, instrument reproduction, visual system response, and accurate aircraft cabin noises. Persisting problems are stressed as down-time for the simulators, lack of use of simulators for practice instead of as a testing tool only, and lack of authentic parts in the cockpit. Future necessities for actual zero-flight time training are outlined, and methods for training for flying different types of aircraft to maximize shifts of trained abilities are suggested. M.S.K.

A82-20528 **The use of flight simulators in l'Armée de l'Air.** F. Lemarchal (Ministère de la Défense, Etat-Major de l'Armée de l'Air, Paris, France). In: Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981.
London, Royal Aeronautical Society, 1981. 3 p.

Various aspects of the use of flight simulators by the French air force are examined, noting a decrease in fuel expenditures by use of the trainers. Proficient control of the aircraft is considered essential to making maximum use of other sophisticated instrumentation such as advanced radars and missile store indicators. Flying time is eliminated during take-off and runway circuit training, and human factor accident rates are decreased by exposing the pilots to critical situations, as well as recovery procedures, before actual flying begins. The deployment of simulators among service divisions is outlined, and current programs in operation are described. Finally, the French air force combat simulator is discussed, including its advantages for repetitive exposure, adjustments in the flight envelope to fit the students' abilities, and comprehensive instrumentation replication. M.S.K.

A82-20530 **The aircraft manufacturer's needs as a simulator user.** J. W. Martz (Boeing Commercial Airplane Co., Renton, WA). In: Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981. London, Royal Aeronautical Society, 1981. 6 p.

The use of flight simulators by the aerospace industry is examined. Aircraft manufacturers use engineering and flight training simulators, and also test facilities and equipment rigs for each developmental phase of a craft. The test facilities include wind tunnels, a system integration test facility, cabin air supply mock-up, engineering mock-ups, etc. Actual flight simulators are divided into one unit for acquainting the pilot with primary instrumentation and the electro-hydraulic force feel, another with the electro-hydraulic system and a three degrees-of-freedom motion base, and other units for differing numbers of crew members, all equipped with digital avionics and systems integration. Boeing is noted to be preparing simulators with six degrees of freedom for simulation of flight conditions on the 727, 737, 757, and 767 aircraft, with training curricula available for pilots having anywhere from 300 to 20,000 hr of experience. M.S.K.

A82-20531 **ASW and weapon system simulation with reference to the Nimrod MR Mk2 maritime crew trainer.** K. Wells (Marconi Space and Defense Systems, Ltd., Stanmore, Middx., England). In: Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981. London, Royal Aeronautical Society, 1981. 5 p.

The features and operational characteristics of the Mk 1 and Mk 2 training simulators for the Nimrod helicopter crew members are described. The Maritime Crew Trainer (MCT) for the Mk 1 system fully simulates sonar, ESM, radar, MAD, communications, routine and tactical navigation, and weapons management. Crew members are supplied with alphanumeric displays and a keyboard, and the instructor can direct a full range of targets, operational conditions, and instrument faults. Improvements to the Mk 2 facility include digital provisions for ASW operations, navigational interlinks with the sonar and radar system, and weapons systems management. Further additions in sonar and radar target, environmental, sonobuoy, and receiver-transmitter simulation are outlined, and a recommendation is given that simulators be designed with same requirements as the aircraft they simulate. M.S.K.

A82-20532 **Automation in flight simulation of data handling and validation testing.** J. Shlien (CAE Electronics, Ltd., Montreal, Canada). In: Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981.
London, Royal Aeronautical Society, 1981. 11 p.

The use of automated simulation devices to effect heightened fidelity in the transfer of actual operational aircraft parameters to training simulators is discussed. The automated hardware use digital processing, allowing consideration of large volume data points of lateral to longitudinal cross-coupling, complicated surface interference effects, ground effects, engine interference effects, and downwash effects. System inputs comprise a library listing of all breakpoints to be used, correlation of function to corresponding function, and the manufacturers' data points. There is no loss of data resolution, updates can be rapidly incorporated, and a direct traceability exists between the manufacturer's data and the simulator's files. FORTRAN is noted as the accepted software checking language, and the use of automated simulator six degree-of-freedom hardware is stressed as having released the instructor from having to verify the simulator program and allowed concentration on presenting actual critical flying conditions to the trainee. M.S.K.

A82-20533 **The effects on simulators of advances in aircraft technology.** J. Baradat (Thomson - CSF, Division Simulateurs, Trappes, Yvelines, France). In: Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981.
London, Royal Aeronautical Society, 1981. 5 p.

Advances in flight technology which impinge on the design of flight simulators are discussed. The increase in control surfaces, automated flying modes, and digital avionics displays have increased the magnitude and complexity of the software data necessary for high-fidelity simulation. The characteristics of the transfer circuits are adapted to the aircraft equipment input-output characteristics, and simulators are required to provide freeze-frame capability, repetition of important flight phases, and time acceleration or jumps. The use of either common bus or arborescent architecture for the data processing is outlined, and attention is given to software updates, particularly for the autopilot, and the choice of software, specifically when a necessity arises for a manufacturer to yield aircraft software to the simulator manufacturer. M.S.K.

A82-20535 **Advanced simulation.** C. H. Huettner (FAA, Office of Flight Operations, Washington, DC). In: Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981.
London, Royal Aeronautical Society, 1981. 6 p.

The Advanced Simulation Rule, the guidance implementing the Rule, the FAA National Simulator Evaluation Team, the status of other simulator evaluation activities, and future FAA simulator activities are discussed. The Phase II certification occurred in January 1981, and signalled the incorporation of realistic three-dimensional windshear dynamics, stopping and directional control forces for various runway conditions, braking dynamics, six degrees-of-freedom simulation, operational navigation, and aircraft cabin noise fidelity into pilot training simulators. Further cloud and lighting advances are described, and Phase III requirements are mentioned as including varying light and visual representations, weather anomalies, realistic colors, and weather radar. FAA circular 121-14C is outlined, the manner of using Phase I equipment to gain Phase II certification, and the functions of the nine FAA simulator evaluations specialists are examined. M.S.K.

A82-20536 **A European airline's future simulator requirements.** J. Meier (Swissair AG, Zurich, Switzerland). In: Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981. London, Royal Aeronautical Society, 1981. 13 p.

The features and operations of the Swissair DC-9-81 simulator are reviewed, and the Phase I, II, and III FAA requirements for simulators are discussed. The simulator software has been upgraded in the DC-9-81 to include ground reactions and handling, brake and antiskid modeling, ground proximity, atmospheric simulation, FORTRAN programming, and an improved motion program. Control feel and force have also been added to express the mass of control components, the dead band, breakout forces, autopilot forces, trim, opposite in sense to the tip vortex. The vortex-induced downwash outboard of the device serves to control the leading-edge stall development in the wing-tip regions. Wind-tunnel results on 60-deg and 74-deg flat-plate delta wings are presented to illustrate the operation of the pylon vortex generator in modifying the spanwise leading-edge separation characteristics resulting in effective alleviation of the pitch-up. (Author)

A82-22054 # **Isolated nacelle performance - Measurement and simulation.** J. L. Crook, D. P. Nelson, R. H. Wiley, and W. M. Presz, Jr. (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0134.* 10 p. 16 refs.

Results are presented from isolated flow through nacelle model tests which were conducted to acquire reliable data for computational nacelle performance prediction verification. The data includes static external and internal pressures, boundary layer rakes, hot film transition measurements, and momentum drag measurements. External surface pressure coefficients are compared against inviscid analytical predictions from state of the art transonic potential flow codes including non-conservative potential, conservative potential, and Euler solvers. Comparisons are made for free stream Mach numbers in the range of 0.71 to 0.84 and mass flow ratios between 0.54 and 0.80. Viscous predictions from an integral boundary layer technique are compared to measured transition location. Nacelle drag components are compared to an inviscid viscous analysis including pressure drag, additive drag, skin friction drag and total momentum loss. These analyses are shown to accurately predict nacelle drag, and drag trends with flow conditions and contour variations. (Author)

A82-22060 # **Basic studies of the flow fields of airfoil-flap-spoiler systems.** S. Bodapati, K. Karamcheti (Stanford University, Stanford, CA), and M. D. Mack (Boeing Commercial Airplane Co., Seattle, WA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0173.* 10 p. 6 refs.

Spoilers are used as lateral controls, speed brakes and lift dumpers during various stages of flight. The wakes created by the spoilers interact with horizontal tail and may cause buffet. A theoretical and experimental investigation has been undertaken at Stanford University to study steady and fluctuating flow fields of airfoil-flap-spoiler systems. A series of experiments have been conducted to investigate steady and fluctuating boundary layers, wakes and pressures. The results are being analyzed in conjunction with the unsteady Schlieren photographs and will be reported in different papers. Here a complete investigation relating various aspects including the design philosophy, instrumentation and data acquisition and analysis techniques will be reported and typical results will be discussed. (Author)

A82-22074 * # **High angle-of-attack characteristics of three-surface fighter aircraft.** M. A. Croom, S. B. Grafton, and L. T. Nguyen (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0245.* 11 p. 6 refs.

As part of a research program aimed at providing information on the high angle-of-attack characteristics of three-surface fighter concepts incorporating a close-coupled canard, an investigation is being conducted on two specific configurations based on the F-18 and F-15 designs. The study configurations are being subjected to a wide range of tests including wind-tunnel tests, dynamic model tests, and piloted simulation. This paper summarizes the results obtained to date in this study. High-alpha results in the areas of static stability, damping, and control characteristics are reviewed and some of the more significant aerodynamic phenomena are identified. (Author)

A82-22077 * # **Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts.** J. C. Wai, H. Yoshihara (Boeing Co., Seattle, WA), and W. K. Abeyounis (NASA, Langley Research Center, Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0255.* 16 p. 8 refs. Research supported by the Boeing Co; Contract No. NAS1-15887.

A transonic small perturbation method has been developed for the analysis of general wing-fuselage-nacelle-pylon configurations with powered jet exhausts. Finite difference successive line relaxation algorithm is used to solve the small disturbance potential equation in conservative form. The nacelle tangency condition and the jet exhaust plume contact conditions are fulfilled in a quasi-cylindrical fashion on a surface fitting the Cartesian grid. The pylon tangency condition is treated in a quasi-planar manner as for the wing. Viscous displacement effects on the wing are modeled by suitable shape changes including the placement of a viscous ramp at the base of the shock. Computed results of a transport configuration show satisfactory correlation with test data. (Author)

A82-22079 # **A simulator assessment of a wide field of view head-up display for presenting a FLIR sensor image during low level navigation and ground attack missions.** R. A. Cooke and J. C. Mabberley (Royal Aircraft Establishment, Flight Systems Dept., Farnborough, Hants., England). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0261.* 5 p.

The paper describes an initial simulator trial which will assess a very wide-angle head-up display and a thermal imaging system optimized for ground attack missions. An air-to-ground simulator developed for the trial is discussed in detail and results of early experiments are presented. It is found that the displayed image, general flight cues, and cockpit environment are realistic in terms of pilot operation and behavior, and thus, the facility described provides a valuable tool for assessing various trade-offs between system configurations and performance. V.L.

A82-22081 * # **Aerodynamic characteristics of airfoils with ice accretions.** M. B. Bragg and G. M. Gregorek (Ohio State University, Columbus, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0282.* 15 p. 19 refs. Grant No. NAG3-28.

Results of a wind tunnel test to evaluate the performance of an airfoil with simulated rime ice are presented with theoretical comparisons. A NACA 65A413 airfoil was tested in the OSU 6 x 22 inch Transonic Airfoil Wind Tunnel at a Reynolds number near three million and Mach numbers from 0.20 to 0.80. The model was tested in four configurations to determine the aero-dynamic effects of the roughness and shape of a rime ice accretion. The simulated rime ice shape was obtained analytically using a time-stepping dry ice accretion computer code. Lift, drag, moment coefficients, and pressure distributions for the clean and simulated rime ice cases are reported. The measured degradation in airfoil performance is compared to an analytical method which uses existing airfoil analysis computer codes with empirical corrections for the surface roughness. A discussion of the empirical surface roughness correction and uses of other airfoil computer methods is included. (Author)

A82-22082 # **A split coefficient/locally monotonic scheme for multishocked supersonic flow.** J. E. Daywitt, D. J. Szostowski (General Electric Co., Re-Entry Systems Div., Philadelphia, PA), and D. A. Anderson (Iowa State University of Science and Technology, Ames, IA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0287.* 14 p. 27 refs. Research sponsored by the General Electric Co.; Contract No. F04701-78-C-0104.

A new finite difference technique is developed for solving three-dimensional, steady, inviscid, supersonic, equilibrium real-gas flows with embedded shock waves. The technique employs the split coefficient matrix (SCM) method to solve the gasdynamic equations in the form of decoupled compatibility relations. In the SCM technique the coefficient matrices are split according to the sign of their eigenvalues. The derivatives associated with each split coefficient matrix are approximated by one-sided difference operators consistent with signal propagation paths. Results demonstrate that problems of conventional finite difference methods with non-orthogonal grids are alleviated in the SCM approach. In addition, solutions obtained using the SCM technique show that strong cross-flow gradients, including cross-flow shocks, can be accurately computed. To treat flows containing embedded stream-wise shock waves the SCM technique is replaced, at grid points detected to be in the vicinity of a shock, by the monotonic self-adjusting hybrid/artificial compression method (ACM). The governing equations are cast in conservation-law form in the shock-capturing ACM approach with damping terms added to eliminate post-shock oscillations. Stream-wise shocks of sufficient strength to cause conventional shock-capturing methods to fail are resolved using the combined SCM/ACM technique. (Author)

A82-22083 # **Measurements of a three-dimensional boundary layer on a sharp cone at Mach 3.** W. J. Yanta, D. W. Ausherman, and E. R. Hedlund (U.S. Navy, Naval Surface Weapons Center, Silver Spring, MD). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0289.* 11 p. 9 refs. Navy-sponsored research.

Three-dimensional boundary layer measurements were carried out on a 7 deg semi-vertex angle sharp cone for angles of attack of 0, 2 and 4 deg in the NSWC Supersonic Tunnel number 2 at a freestream Reynolds number of 2.3 x 10 to the 6th/ft. (7.0 x 10 to the 5th/m). Included were measurements of the mean U, V, and W velocity components for seven circumferential locations around the body and one axial station. These were obtained using a three-dimensional laser Doppler velocimeter. The flow was investigated in both the viscous and inviscid portions of the flow field, yielding information about the velocity profile behavior in both regions. In addition, skin friction measurements were made with a surface mounted Preston probe at five axial stations along the cone. The effects of angle of attack and body roll position on the three-dimensional boundary layer profiles and skin friction are discussed. (Author)

A82-22091 # **Propulsion system controls design and simulation.** E. Tjonneland and C. M. Carlin (Boeing Military Airplane Co., Seattle, WA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0322.* 27 p. 11 refs.

A propulsion system real-time simulation facility was developed for the design, analysis, simulation and evaluation of propulsion control systems. The functional requirements for the facility, the implementation of these requirements, and the utilization of the facility in advanced control technology programs is described. A hybrid approach to plant simulation permits realization of the desired levels of portability, flexibility, computational accuracy, and reliability. Control development tools have been integrated into a facility to support the development of digital propulsion control systems as well as their integration with airframe control systems. The success of controls and simulation development depends largely on the attention to the detailed work tasks, and much of the computational technology has already been transferred to automated interactive minicomputer work methods. J.F.

A82-22094 * # **Steady and unsteady nonlinear hybrid vortex method for lifting surfaces at large angles of attack.** O. A. Kandil, L.-C. Chu, and T. Tureaud (Old Dominion University, Norfolk, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0351.* 14 p. 20 refs. Grant No. NsG-1560; Contract No. N62269-80-C-0704.

Steady and unsteady Nonlinear Hybrid Vortex (NHV) method, for low aspect ratio wings at large angles of attack, is developed. The method uses vortex panels with first-order vorticity distribution (equivalent to second-order doublet distribution) to calculate the induced velocity in the near field using closed form expressions. In the far field, the distributed vorticity is reduced to concentrated vortex lines and the simpler Biot-Savart's law is employed. The method is applied to rectangular wings in steady and unsteady flows without any restriction on the order of magnitude of the disturbances in the flow field. The numerical results show that the method accurately predicts the distributed aerodynamic loads and that it is of acceptable computational efficiency. (Author)

A82-22096 * # **Store separation from cavities at supersonic flight speeds.** R. L. Stallings, Jr. (NASA, Langley Research Center, High-Speed Aerodynamics Div., Hampton, VA). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0372.* 6 p. 5 refs.

An experimental investigation has been conducted to determine the aerodynamic characteristics of a typical wing-control missile configuration during separation from a box-type cavity having depth to length ratios (D/L) ranging from 0.088 to 0.225. The cavity was located in a splitter plate that spanned the low Mach number test section of the Langley Unitary Plan Wind Tunnel. Aerodynamic characteristics are presented for Mach 2.36 and a free-stream unit Reynolds number of 2,000,000/ft. For the shallow cavity (D/L = 0.088), large interactions existed between the cavity and the flat plate flow field, which resulted in unfavorable separation characteristics for the missile model. For the deep cavity (D/L = 0.225), the flat plate flow field essentially bridged the cavity, resulting in minor interactions and favorable separation characteristics for the missile model. (Author)

A82-22110 # **Aerodynamic characteristics of maneuvering flaps.** B. Fang, B. Hu, H. Wang, and Y. Zhang (Shengyang Aircraft Corp., People's Republic of China). *Acta Aeronautica et Astronautica Sinica,* vol. 2, Sept. 1981, p. 1-13. In Chinese, with abstract in English.

Results of wind tunnel tests on the effects of aircraft maneuvering flaps are reported, specifically for reducing drag, and for the effects of the flap span, the flap chord, the strake, and the wing planform on the aerodynamics of the maneuvering flap. The matching of leading edge and trailing edge flaps, and the improvement in large angle of attack flying due to the presence of maneuvering flaps are discussed. Maneuvering flaps allow control of the flow separation and decrease drag at large angles of attack, and expand the buffet boundary and decrease the buffet intensity. Methods of incorporating the effects of the maneuvering flaps into the design of the aircraft structure and the control system are indicated. M.S.K.

A82-22111 # **Numerical calculation of lift, moment coefficient and dynamic stability derivatives on sideslipping wings in unsteady supersonic flows.** G. Zhang (Nanjing Aeronautical Institute, Nanjing, People's Republic of China). *Acta Aeronautica et Astronautica Sinica,* vol. 2, Sept. 1981, p. 14-22. In Chinese, with abstract in English.

This paper presents a numerical solution of unsteady supersonic flows for sideslipping wings by means of the characteristic lines network method of unsteady supersonic sources distributed on the wing plane. This paper provides the oscillating mode of undulatory, pitching-and-rolling harmonic oscillations of the wings with sideslip angles, and the methods to calculate its lift, moment coefficient, and dynamic stability derivatives. The dynamic stability derivatives of a typical wing with sideslip angle equal to zero were worked out both by analytical formula in conformity with the conventional quasi-stationary theory and by the present method, and were compared and examined. The results show that the present method is satisfactory. (Author)

A82-22112 # **Numerical computation of unsteady subsonic aerodynamic forces on wing-body-tail exposed to travelling gust.** G. Wen (Beijing University, Beijing, People's Republic of China) and Z. Sun (Air Force Laboratory, People's Republic of China). *Acta Aeronautica et Astronautica Sinica,* vol. 2, Sept. 1981, p. 23-30. In Chinese, with abstract in English.

The effects of unsteady subsonic aerodynamic forces on the wing-body-tail configuration and the interference effects between the components are examined numerically. A small angle of attack and a weak shock is assumed, and a linear method for the moving vortex finite element solution is employed to solve an initial boundary value problem of the wave equation. A set of algebraic equations is solved at each time interval, and numerical calculations are performed for various blast orientations, elevation angles, and different complex planforms. The derived lift coefficients for wing-body configurations are found to match experimental data, while convergence was not obtained for the complex planform for the variations of lift and moment coefficients. F/A-18 WEAPONS SYSTEM SUPPORT FACILITIES
Thomas F. O'Neill *In* AGARD Tactical Airborne Distributed Computing and Networks Oct. 1981 7 p

Avail: NTIS HC A18/MF A01

The U.S. Navy is currently acceptance-testing the McDonnell Douglas F/A-18 aircraft. Since the F/A-18 is so much more complex than any aircraft current deployed, more sophisticated support tools will be required. The main support tool is to be a weapons system support facility including all of the hardware and software necessary to test, modify, and validate all of the avionics hardware, software, and firmware. A distributed processing approach is used in the facility, which contains several minicomputers and super minicomputers. Author

BLADE PLANFORM FOR A QUIET HELICOPTER Final Report
D. S. Janaki Ram Sep. 1980 31 p refs
(NASA Order A-65550B)
(NASA-CR-166256; T-35584) Avail: NTIS HC A03/MF A01 CSCL 01C

The effects of blade planform and tip speed on noise and performance for a Hughes 500 C rotor system were studied. A cursory examination of the effects of such planform shapes as regular, inverse, and no taper on the noise and performance of the rotor was conducted. It was found that a constant width wide chord planform at tower tip speed provided the best performance and lowest noise. The tapered planforms had lower performance figures due to the reduced solidity. However, some noise reductions were achieved. R.J.F.

TESTS OF A D VENTED THRUST DEFLECTING NOZZLE BEHIND A SIMULATED TURBOFAN ENGINE Final Report
T. L. Watson Washington NASA Jan. 1982 139 p refs
(Contract NAS3-21733)
(NASA-CR-3508; MDC-A6930) Avail: NTIS HC A07/MF A01 CSCL 01A

A D vented thrust deflecting nozzle applicable to subsonic V/STOL aircraft was tested behind a simulated turbofan engine in the verticle thrust stand. Nozzle thrust, fan operating characteristics, nozzle entrance conditions, and static pressures were measured. Nozzle performance was measured for variations in exit area and thrust deflection angle. Six core nozzle configurations, the effect of core exit axial location, mismatched core and fan stream nozzle pressure ratios, and yaw vane presence were evaluated. Core nozzle configuration affected performance at normal and engine out operating conditions. Highest vectored nozzle performance resulted for a given exit area when core and fan stream pressure were equal. Its is concluded that high nozzle performance can be maintained at both normal and engine out conditions through control of the nozzle entrance Mach number with a variable exit area. E.A.K.

A NEW METHOD OF ESTIMATING THE LATERAL WALL EFFECT ON THE AIRFOIL INCIDENCE DUE TO THE SUCTION AT SIDE WALLS
Hideo Sawada, Seizo Sakakibara, Mamoru Sato, Hiroshi Kanda, and Toshio Karasawa Aug. 1981 20 p refs In JAPANESE; ENGLISH summary
(NAL-TR-680; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

The velocity component is approximated from the pressure difference across the plates by the aid of an experimental equation which states that the normal velocity component to a porous plate induced by the pressure difference across the plate is proportional to the square root of the pressure difference. In this method, the proportional constant number need not be known. An experiment was carried out in which the pressure in a suction box, one side of which consisted of a porous plate, was set at various values in this experiment. The lift coefficient of an airfoil model changed with the variation of the pressure in the suction box even at the same uniform flow speed and the same incidence. The unique value of the lift coefficient was determined from several such lift coefficients at the same incidence. The corrected lift coefficient curve obtained is very close to one obtained in a test section with fully solid side walls. T.M.

SURVEYS OF FLOW-FIELD AROUND EMPENNAGE OF THE NAL STOL-RESEARCH-AIRCRAFT MODEL
Jul. 1981 80 p refs In JAPANESE; ENGLISH summary
(NAL-TR-677; ISSN-0389-4010) Avail: NTIS HC A05/MF A01

The flow field around the empennage for the STOL landing were measured. The down wash angle, the side wash angle, and the dynamic pressure at the aerodynamic center of the empennage were obtained by linear interpolation at the two sections perpendicular to the free steam. Effects of the engine thrust coefficient and the two types of vortex generator on the flow field, and the directional stability in the case of an inner engine becoming inoperative, were studied. EXPERIMENTAL STUDY OF DELTA WING LEADING-EDGE DEVICES FOR DRAG REDUCTION AT HIGH LIFT M.S. Thesis
Thomas Dwight Johnson, Jr. Dec. 1980 139 p refs
Avail: NTIS HC A07/MF A01

Future fighter aircraft requirements specify efficient supersonic cruise and high-g maneuverability at high lift. The slender delta wing meets the first requirement but has large lift induced drag increments at high lift. One method to alleviate the drag is to control the flow at the wind leading edge (LE) by means of small LE devices, so as to maintain locally attached flow to higher angles of attack and thus increase the level of aerodynamic thrust. The devices selected for evaluation were the fence, slot, pylon-type vortex generator (VG), and sharp leading-edge extension (SLEE). These devices were tested on a 60 deg flatplate delta (with blunt LE) in the Langley Research Center (NASA) 7- by 10-foot high-speed tunnel at low-speed and to angles of attack of 28 degrees. Balance and static pressure measurements were taken. The results indicate that all the devices have significant drag reduction capability and improved longitudinal stability while a slight loss of lift and increased cruise drag occurred. T.M.

EXPERIMENTAL TRIM DRAG VALUES FOR CONVENTIONAL AND SUPERCRITICAL WINGS M.S. Thesis
Peter Fredric Jacobs Dec. 1981 165 p refs Sponsored by NASA
(NASA-CR-168500) Avail: NTIS HC A08/MF A01 CSCL 01A

Supercritical wings were studied to determine whether they incur higher trim drag values at cruise conditions than wide body technology wings. Relative trim drag increments were measured in an experimental wind tunnel investigation. The tests utilized high aspect ratio supercritical wing and a wide body wing in conjunction with five different horizontal tail configurations, mounted on a representative wide body fuselage. The three low tail configurations and two T tail configurations were chosen to measure the effects on horizontal tail size, location, and camber on the trim drag increments for the two wings. The increase in performance (lift to drag ratio) for supercritical wing over the wide body wing was 11 percent for both the optimum low tail and T tail configurations. S.L.

ROLL UP MODEL FOR ROTOR WAKE VORTICES, PART 5
Maarten Landahl Stockholm Aeronautical Research Inst. of Sweden 13 Nov. 1981 28 p refs
(Contract NE-5061-014)
(ASRL-TR-194-4; FFA-HU-2262-Pt-5) Avail: NTIS HC A03/MF A01

Conservation of momentum and energy is used to estimate the core size of a rolled-up vortex from a propeller or rotor blade tip. A simplified planar model due to Prandtl is employed to determine the strength, position, and core size of the rolled-up vortices. This model is valid when the number of blades is large

such that the distance between the wake vortex sheets is much less than the diameter of the rolled-up vortex spirals. The vortex is assumed to have a core of constant vorticity (Rankine vortex). Three dimensionality is then accounted for by modeling the actual spiral wake vortex as a row of regularly spaced vortex rings. The core diameter is found to be about 40 percent of this distance, with a slight decrease with increase in spacing-to-diameter ratio. The core velocity is found to increase with increased spacing from 0.5 of the wake velocity at zero spacing to about 0.7 of the wake velocity at a spacing of three times the wake radius.

A WIND TUNNEL STUDY OF THE FLUTTER CHARACTERISTICS OF A SUPERCRITICAL WING

R. Houwink, A. N. Kraan, and R. J. Zwaan 28 Jan. 1981 10 p refs Presented at 22nd SDM/Dyn. Specialists Conf., Atlanta, 6-10 Apr. 1981 Sponsored by Netherlands Agency for Aerospace Programs Prepared in cooperation with Royal Netherlands Aircraft Factories Fokker, Amsterdam
(NLR-MP-81002-U) Avail: NTIS HC A02/MF a01

A wind-tunnel flutter test on a supercritical wing model is described. Objectives of the test were to investigate the transonic dip and to enable comparison with calculated flutter characteristics in which a quasi-three dimensional transonic theory was used. The beginning of a transonic dip was measured and a satisfactory agreement with theory could be found. An additional flutter instability in the bottom of the transonic dip could be correlated with the loose of transition strip effectivity at low Reynolds numbers.

DEVELOPMENT OF A COMPUTER BASED PRESENTATION OF NON-STEADY HELICOPTER ROTOR FLOWS Interim Report, 1 Jul. 1979 - 30 Apr. 1981

Henry R. Velkoff and Richard R. Navarro Sep. 1981 121 p refs
(Contract DAAG29-79-C-0074)
(AD-A108107; ARO-14142.6-EX; OSURF-761646/711999) Avail: NTIS HC A06/MF A01 CSCL 01/3

A system to measure the non-steady velocities in the model rotor wake was modified to provide velocity data in a form more useful to the user of the data. Hot wire angle parameters were modified so as to provide better correlations by using cosine law in place of the usual K-squared technique common in hot-wire anemometry. The results of the non-steady measurements were presented in the form of motion pictures of the non-steady computer generated vector plots. Author (GRA)

(AD-A107722; ARO-14142.5-EX; OSURF-761646/711999) Avail: NTIS HC A07/MF A01 CSCL 20/4

A system was developed which could measure the instantaneous velocities in the wake of a model helicopter rotor operating at low advance ratios. A three-wire hot film probe was mounted on a traverse and placed at many positions in the wake. The output of the probe was fed into an on-line computer operating in an interactive mode. Computer generated vector plots were made of both time averaged velocities and instantaneous velocities for the case of mu = 0.06.

EXPERIMENTAL VERIFICATION OF AN AERODYNAMIC PARAMETER OPTIMIZATION PROGRAM FOR WIND TUNNEL TESTING Final Report, Oct. 1980 - Sep. 1981

Richard L. Palko and Margaret Anne Crawford AEDC Nov. 1981 32 p refs
(AD-A107727; AEDC-TR-81-23) Avail: NTIS HC A03/MF A01 CSCL 20/4

The optimization algorithm developed for the SOFT wing program has been revised to make it more applicable for use in routine wind tunnel testing. The algorithm modification removed some unused routines and simplified the control input requirements. The modified optimization algorithm was demonstrated in the 1-ft transonic Aerodynamic Wind Tunnel (1T) using a 3-degree-of-freedom model. The test Mach number was 0.8. The algorithm was successfully demonstrated for all three optimization runs attempted. These included minimization of drag coefficient for a specified coefficient of lift, maximization of lift coefficient for a specified coefficient of drag, and maximization of lift-to-drag ratio for a specified coefficient of drag.

FINITE DIFFERENCE COMPUTATION OF THE CONICAL FLOW FIELD OVER A DELTA WING

L. Vigevano Aug. 1981 55 p refs
(VKI-TN-140) Avail: NTIS HC A04/MF A01

A numerical approach using finite differences applied to a nonlinear governing equation was adopted in order to introduce compressibility effects in a model of the vertical flow past a sharp leading edge on a delta wing. A conical line vortices model was adapted to a through field computation. From numerical experiments, criteria for the representation of a mathematical vortex in a finite difference scheme are derived Comparison of the numercial results with the Brown and Michael analytical solution shows that the first order scheme employed preserves satisfactory accuracy in the prediction of the wing loads.

NEW CONCEPTS IN MULTIFUNCTIONAL CORROSION FOR AIRCRAFT AND OTHER SYSTEMS

M. Khobaib and F. W. Vahldiek *In* AGARD Aircraft Corrosion Aug. 1981 13 p refs

Avail: NTIS HC A09/MF A01

Multifunctional nonchromate inhibitors were developed for a Rinse Facility to reduce corrosion maintenance costs by removing corrosive contaminants from aircraft which operate in aggressive environments such as marine environments. These inhibitor systems are low cost, water soluble, nontoxic formulations which are effective against general corrosion, localized corrosion, and environmentally assisted crack growth under conditions of stress corrosion and corrosion fatigue. Extensive polarization, immersion, and galvanic-coupling experiments were conducted to determine effectiveness. A borax-nitrite-based inhibitor containing small additions of nitrate, silicate, phosphate, and mercaptobenzothiazole was found to provide excellent corrosion protection for high strength aluminum and steel alloys used in aerospace applications and for copper-bearing alloys used in electronic components and in parts of the Rinse Facility. Envionmental effects upon crack-growth rates of aluminum and high strength steel alloys were eliminated, reducing the rates in corrosion fatigue as compared to those obtained in air. A test program using these inhibitors is described. Tracking of maintenance costs and corrosion damage in being conducted to determine the effectiveness of the inhibited rinse in reducing corrosion costs. M.D.K.

CORROSION IN NAVAL AIRCRAFT ELECTRONIC SYSTEMS

Irving S. Shaffer *In* AGARD Aircraft Corrosion Aug. 1981 12 p refs

Avail: NTIS HC A09/MF A01

Naval aircraft electronic equipment suffer frequently from the effects of moisture and corrosion. The critical design features which have led to excessive susceptibility to these failure modes are described. Several examples are cited of inadequately protected equipment located in aircraft installations where they were subjected to repeated moisture intrusion during rainstorms, low level flights over water and high pressure fresh water washdowns. The specific deterioration effects that occurred on the various components that make up the avionic systems are presented. Maintenance data summaries are included to denote further the corrosion problem severity. Corrective measures in design, testing and maintenance are also discussed. Author

REFINING AND UPGRADING OF SYNFUELS FROM COAL AND OIL SHALES BY ADVANCED CATALYTIC PROCESSES Interim Report
R. F. Sullivan, D. J. ORear, and H. A. Frumkin Sep. 1981 319 p refs
(Contracts DE-AC22-76ET-10532; EF-76-C-01-2315)
(DE82-001127; DOE/ET-10532/T3; FE-2315-61; IR-5) Avail: NTIS HC A14/MF A01

Two coal syncrudes derived from Illinois No. 6 and Wyodak coals were refined in a extensive program which included pilot plant and laboratory studies. These studies demonstrated that advanced, commercial petroleum technology can be used to refine these syncrudes to gasoline, jet, diesel and heating fuels. The coal syncrudes have a low hydrogen content, compared to petroleum, and high concentrations of oxygen and nitrogen impurities. These syncrudes are a blend of two coal distillates boiling between C sub 5 and 680 F. Consequently, they contain no residual and have about 95% boiling in the gasoline or diesel fuel ranges. With these properties, an appropriate way to refine the syncrudes is by hydroprocessing. Hydroprocessing yields a volume of finished products which is almost equivalent to the original volume of syncrude. In addition, the heteroatoms are ultimately removed as sulfur and salable ammonia. The engineering studies provided estimates of the refining costs. DOE

EVALUATION OF THE DESIGN, CONSTRUCTION AND OPERATION OF A GAS FUELED ENGINE DRIVEN HEAT PUMP
C. A. Phillips Jan. 1981 76 p refs
(ERG-034) Avail: NTIS HC A05/MF A01

The design, construction, testing, and evaluation of a gas fueled engine driven heat pump are considered. The heat pump, using air as its source of heat is driven by a 360 cc single cylinder marine engine converted to run on natural gas. The unit was built, installed in a laboratory, and underwent intensive performance testing. The heat pump works well and justifies the design assumptions made, having allowed for a poor performance from the particular engine used. At 6 C (ambient) an output of 14 kW with an overall efficiency or C.O.P. (total heat output/gas input) of 1.1 was achieved. Results compare favorably with a seasonal efficiency of a gas boiler of around 0.65 to 0.70. J.M.S.

A VELOCITY VECTOR MEASURING SYSTEM WITH 13 ASYMMETRIC WEDGE TYPE YAWMETERS
Teruomi Nakaya, Hideo Hoshio, and Masayoshi Noguchi Jun. 1981 20 p refs In JAPANESE; ENGLISH summary
(NAL-TR-674; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

In order to survey the flow field around the empennage of the NAL STOL research aircraft model in the 6m low speed wind tunnel, a velocity vector measuring system with 13 asymmetric wedge type yawmeters was developed. The rotational angle of the 13 probes and the setting angle of this system are automatically controlled following the sequence previously programmed into a minicomputer system. The hardware, control modes, data reduction, and data processing are described. The accuracy of the flow angle measurement turned out to be satisfactory, but measurements of dynamic pressure and static pressure were less accurate. An example of measurements taken of the flow field around the empennage of the STOL research aircraft model is included. A.R.H.

DEVELOPMENT OF A SIMPLE, SELF-CONTAINED FLIGHT TEST DATA ACQUISITION SYSTEM Progress Report
Ronald R. L. Renz Feb. 1981 208 p refs
(Grant NsG-4019)
(NASA-CR-168438; KU-FRL-407-6) Avail: NTIS HC A10/MF A01 CSCL 14B

A low cost flight test data acquisition system, applicable to general aviation airplanes, was developed which meets criteria for doing longitudinal and lateral stability analysis. Th package consists of (1) a microprocessor controller and data acquisition module; (2) a transducer module; and (3) a power supply module. The system is easy to install and occupies space in the cabin or baggage compartment of the airplane. All transducers are contained in these modules except the total pressure tube, static pressure air temperature transducer, and control position transducers. The NASA-developed MMLE program was placed on a microcomputer on which all data reduction is done. The flight testing program undertaken proved both the flight testing hardware and the data reduction method to be applicable to the current field of general aviation airplanes. A.R.H.

DEVELOPMENT AND LABORATORY TESTING OF A THERMAL EMISSION VELOCIMETER FOR APPLICATION TO AN EROSION NOSE TIP TEST FACILITY Final Report, Jul. 1979 - Nov. 1980
James D. Trolinger and M. J. Houser Wright-Patterson AFB, Ohio AFWAL Aug. 1981 23 p refs
(Contracts F33615-76-C-3145; F33615-79-C-3030; AF Proj. 2404)
(AD-A107713; SDL-80-6526; AFWAL-TR-81-3080) Avail: NTIS HC A02/MF A01 CSCL 14/2

A thermal emission velocimeter concept was explored and a system was developed for use in measuring particle velocities up to 5,000 meters per second in a reentry erosion facility. The particles, ranging from 10 to 100 micrometers in diameter, are generated to study reentry nose tip erosion and ablation. The approach passively utilizes optical components of a laser transit anemometer coupled to a microprocessor data management system. The system was laboratory tested and has inherent characteristics which should produce quality data in the severe and noisy environment of a reentry test facility. The system sensitivity has been calculated to measure velocity of micrometer sized particles whose temperature are minimally 1700 K. Author (GRA)

Conductive prepregs for lightning strike protection on aircraft
A82-20523
Fatigue behavior of selected non-woven fiber composites for helicopter rotor blades
A82-20524
A study of the suitability of the all fiberglass XV-11A aircraft for fuel efficient general aviation flight research
A82-20764

GLAZES
Transparent polyolefin film armor
[AD-A107562] N82-17377

GLIDE PATHS
Development of a digital integrated automatic landing system /DIALS/ for steep approach and landing
A82-20297
Optimal dolphin hang glider flight
N82-17157

GLIDERS
Design, development and flight testing of a jet powered sailplane
A82-20761

GLOBAL POSITIONING SYSTEM
NAVSTAR global positioning systems
A82-20601
Land navigation with a low cost GPS receiver
A82-20656
Institute of Navigation, Annual Meeting, 36th, U.S. Naval Postgraduate School, Monterey, CA, June 23-26, 1980, Proceedings
A82-21586
Calibrated and uncalibrated inertial navigation system performance in valid and jammed global positioning system environments
A82-21587
The Global Positioning System Evaluator --- facility for testing in simulated wide range environments
A82-21588
A perspective on civil use of GPS
A82-21589
Helicopters and Navstar/GPS
A82-21592

GRAPHITE-EPOXY COMPOSITES
Bolted field repair of graphite/epoxy wing skin laminates
A82-20981
Improving composite bolted joint efficiency by laminate tailoring
A82-20982

GRAVITATIONAL EFFECTS
Stability and response to gravity of the flap lag motion for a rigid rotor blade with flap-pitch coupling
[ISD-270] N82-17640

GROUND BASED CONTROL
Ground movement control and guidance - Cat. 3 operations experience in Air Inter
A82-20222

GROUND EFFECT (AERODYNAMICS)
Ground effect hover characteristics of a large-scale twin tilt-nacelle V/STOL model
[AIAA PAPER 81-2609] A82-19201
Ground reflection effects in aircraft noise measurements
A82-19970

Analysis of flight test measurements in ground effect A82-20763

GROUND EFFECT (COMMUNICATIONS)
Experimental measurement of the low angle terrain scattering interference environment A82-20588

GROUND HANDLING
Study of ground handling characteristics of a maritime patrol airship [NASA-CR-166253] N82-16090

GROUND SUPPORT EQUIPMENT
New life for an 'old' body - Vienna's master plan for revitalization A82-20172

GROUND SUPPORT SYSTEMS
Aeronautical Information Data Subsystem (AIDS): A ground-based component of air navigation services systems N82-17150
Scientific report of the Fluid Mechanics Research Department N82-17469

GROUND TESTS
F-16 ground and inflight icing testing A82-20753

GUST LOADS
Numerical computation of unsteady subsonic aerodynamic forces on wing-body-tail exposed to travelling gust A82-22112

H

HANG GLIDERS
Optimal dolphin hang glider flight N82-17157

HARRIER AIRCRAFT
AV-8B Harrier II A82-21260

HAZARDS
Study of air compressor hazards in underground and surface mines [PB82-105164] N82-17597

HEAD-UP DISPLAYS
A simulator assessment of a wide field of view head-up display for presenting a FLIR sensor image during low level navigation and ground attack missions [AIAA PAPER 82-0261] A82-22079

HEAT FLUX
A durable, intermediate temperature, direct reading heat flux transducer for measurements in continuous wind tunnels [AD-A107729] N82-17483

HEAT MEASUREMENT
A durable, intermediate temperature, direct reading heat flux transducer for measurements in continuous wind tunnels [AD-A107729] N82-17483

HEAT PUMPS
Evaluation of the design, construction and operation of a gas fueled engine driven heat pump [ERG-034] N82-17459

HELICOPTER CONTROL
The use of adaptive control for helicopter trajectories in search operations A82-19065
The application of strapdown inertial technology to Attitude and Heading Reference System requirements --- for YAH-64 advanced attack helicopter A82-21590
Helicopters and Navstar/GPS A82-21592
An investigation of multi-axis isometric side-arm controllers in a variable stability helicopter [AD-A106759] N82-17226

HELICOPTER DESIGN
Soviet helicopter construction /2nd revised and enlarged edition/ --- Russian book A82-18874
Design requirements for modern rescue helicopters A82-19020
Application of the ABC helicopter to the emergency medical service role [AIAA PAPER 81-2653] A82-19219
Fatigue behavior of selected non-woven fiber composites for helicopter rotor blades A82-20524
Helicopter transmission philosophy - The way ahead A82-20546
The emerging need for improved helicopter navigation A82-21591
Predesign study for a modern 4-bladed rotor for the NASA rotor systems research aircraft [NASA-CR-166153] N82-16042
The armed helicopter in air to air missions [MBB-UD-317-81-O] N82-17158
Design Criteria of the A 129 helicopter drive system N82-17215
Helicopter development in France N82-17216
Helicopter propulsions systems. 1: Vibration prevention systems on helicopters 2: Problem of noise in the cabin N82-17222
Future requirements for helicopter propulsion systems N82-17225

HELICOPTER ENGINES
A fuel control system designers approach to gas turbine engine computer model validation A82-19253
Three-dimensional calculation of the flow in helicopter air intakes [ONERA, TP NO. 1981-124] A82-19740
Minimum cost performance monitoring of turboshaft engines A82-20544
Helicopter Propulsion Systems [AGARD-CP-302] N82-17203
Helicopter propulsion systems: Past, present and future N82-17204
Development test programs adapted to helicopter engines N82-17205
Aircraft turbine engine development: Current practices and new priorities N82-17206
Future technology and requirements for helicopter engines N82-17207
Mechanical advances in the design of small turboshaft engines N82-17208
Advanced component development design basis for next generation medium power helicopter engines N82-17209
The influence of new turbine technologies on their components N82-17210
Aerodynamic components for small turboshaft engines N82-17211
Regenerative helicopter engines: Advances in performance and expected development problems N82-17212
Helicopter air inlets N82-17217
Intake design with particular reference to ice protection and particle separators N82-17218
The distress regime on the birotored helicopter N82-17219
Engine/drive/airframe compatibility: A way of life N82-17220
Problems of engine response during transient maneuvers N82-17221
An alternative approach to engineering structures using monitoring systems N82-17223
Component research for future propulsion systems N82-17224
Future requirements for helicopter propulsion systems N82-17225

HELICOPTER PERFORMANCE
Soviet helicopter construction /2nd revised and enlarged edition/ --- Russian book A82-18874
Helicopter secondary applications for neurotraumatic emergencies A82-19015

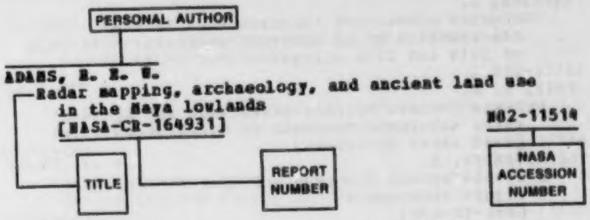
RADIO TELEMETRY
Recent developments in military telemetry
A82-18908
RADIOACTIVE WASTES
Development of in-can melting process and equipment, 1979 and 1980
[DE82-001050] N82-16834
RANDOM LOADS
Methods and models for predicting fatigue crack growth under random loading --- Book
A82-20506
Multi-parameter yield zone model for predicting spectrum crack growth
A82-20510
Crack growth behavior of center-cracked panels under random spectrum loading
A82-20511
Random spectrum fatigue crack life predictions with or without considering load interactions
A82-20512
REAL GASES
Real gas flows over complex geometries at moderate angles of attack
[AIAA PAPER 82-0392] A82-19801
REAL TIME OPERATION
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation
[AIAA PAPER 81-2663] A82-19221
Simulation of advanced cockpits
A82-19259
Real-Time Simulation Computation System --- for digital flight simulation of research aircraft
A82-19260
Piloted simulation of an on-board trajectory optimization algorithm
A82-20296
Color graphics based real-time telemetry processing system
A82-20771
Research through simulation --- simulators and research applications at Langley
[NASA-FACTS-125] N82-16092
RECIPROCAL THEOREMS
Application of the principle of reciprocity to flexible rotor balancing
[ASME PAPER 81-DET-49] A82-19311
RECONNAISSANCE AIRCRAFT
Study of ground handling characteristics of a maritime patrol airship
[NASA-CR-166253] N82-16090
RECTANGULAR WINGS
The velocity potential for the harmonically oscillating, rectangular wing with semiinfinite span in nonlinear theory
A82-19198
An experimental study of separated flow on a finite wing
[AIAA PAPER 81-1882] A82-20293
REDUNDANCY
Stage-state reliability analysis technique
N82-17104
Reconfiguration: A method to improve systems realiability
N82-17107
REFINING
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[DE82-001127] N82-17401
REFRACTED WAVES
Can low-speed jet noise be predicted
A82-22222
REGENERATION (ENGINEERING)
Regenerative helicopter engines: Advances in performance and expected development problems
N82-17212
REINFORCEMENT (STRUCTURES)
Analysis of multiple load path panels containing impact damage
N82-17170
RELIABILITY ANALYSIS
Stage-state reliability analysis technique
N82-17104
Methodology for measurement of fault latency in a digital avionic miniprocessor
N82-17105
Hierarchical specification of the SIFT fault tolerant flight control system
N82-17106
Reconfiguration: A method to improve systems realiability
N82-17107
REMOTE CONSOLES
Instrumentation remote 'mini' ground station
A82-20770
REMOTELY PILOTED VEHICLES
Microwave communications to remotely piloted vehicles
A82-18911
RENDEZVOUS TRAJECTORIES
Piloted simulation of an on-board trajectory optimization algorithm
A82-20296
RESCUE OPERATIONS
Survey of aeromedical evacuation in Italy
A82-19003
The network of civilian air rescue in Germany
A82-19004
Ambulance helicopter in the Stockholm archipelago
A82-19005
Military assistance to safety and traffic /MAST/
A82-19006
The situation of air rescue in Argentina
A82-19010
Aeromedical evacuation in New Zealand
A82-19011
Helicopter secondary applications for neurotraumatic emergencies
A82-19015
Problems pertaining to aeronautical technology in the case of rescue operations with helicopters in mountainous areas
A82-19018
The helicopter in rescue operations in high-mountain areas
A82-19019
Design requirements for modern rescue helicopters
A82-19020
The case for helicopter hoisting
A82-21597
Special investigation report. Search and rescue procedures and arming of emergency locator transmitter: Aircraft accident near Michigan City, Indiana, 7 December, 1980
[PB81-249427] N82-16058
RESEARCH
Research and technology annual report, 1981
[NASA-TM-81333] N82-17081
RESEARCH AIRCRAFT
Quiet Short-Haul Research Aircraft - The first 3 years of flight research
[AIAA PAPER 81-2625] A82-19209
Real-Time Simulation Computation System --- for digital flight simulation of research aircraft
A82-19260
Performance flight test evaluation of the Ball-Bartoe JW-1 Jetwing STOL research aircraft
A82-20762
Preliminary design study of a hybrid airship for flight research
[NASA-CR-166246] N82-17152
RESEARCH AND DEVELOPMENT
Concept definition and aerodynamic technology studies for single-engine V/STOL fighter/attack aircraft
[AIAA PAPER 81-2647] A82-19216
High angle-of-attack characteristics of three-surface fighter aircraft --- canard-wing-horizontal tail configuration for greater stability and control
[AIAA PAPER 82-0245] A82-22074
RESEARCH PROJECTS
The FS2 RAE Bedford civil flight research programme --- on components and system integration for optimum ATC
A82-20519
RESIDENTIAL AREAS
Comparison of aircraft and ground vehicle noise levels in front and backyards of residences
A82-20058
RESONANCE TESTING
Resonance tests on a Piper PA-32R tailplane before and after damage
[AD-A106273] N82-16071
RESONANT FREQUENCIES
Natural frequencies of rotating bladed discs using clamped-free blade modes
[ASME PAPER 81-DET-124] A82-19338

Resonance tests on a Piper PA-32R tailplane before and after damage
[AD-A106273] N82-16071
RESOURCES MANAGEMENT
VTOL as it applies to resource development in the Canadian north
[AIAA PAPER 81-2640] A82-19215
RETROFITTING
JP-8 fuel conversion evaluation
A82-20755
REVERSED FLOW
Comparison of two parallel/series flow turbofan propulsion concepts for supersonic V/STOL
[AIAA PAPER 81-2637] A82-19214
Dilution jet behavior in the turn section of a reverse flow combustor
[AIAA PAPER 82-0192] A82-20291
REYNOLDS NUMBER
Experimental studies of the Eppler 61 airfoil at low Reynolds numbers
[AIAA PAPER 82-0345] A82-19796
Effects of Reynolds number and turbulence level on axial cascade performance
N82-17190
Survey on the effect of blade surface roughness on compressor performance
N82-17191
RIBS (SUPPORTS)
Some observations on the corrosion of aircraft at the air force base in Bandirma, Turkey
N82-17353
RIGID ROTORS
Stability and response to gravity of the flap lag motion for a rigid rotor blade with flap-pitch coupling
[ISD-270] N82-17640
Dynamic analysis of a rotor blade with flap and lag freedom and flap-pitch coupling
[ISD-271] N82-17641
ROBUSTNESS (MATHEMATICS)
An application of total synthesis to robust coupled design --- turbojet engine control
A82-19061
ROCKET FLIGHT
Fiscal year 1981 scientific and technical reports, articles, papers, and presentations
[NASA-TM-82445] N82-16927
ROLLING MOMENTS
Subsonic and transonic roll damping measurements on Basic Finner --- finned missile calibration model
A82-19958
ROTARY STABILITY
Correlating measured and predicted inplane stability characteristics for an advanced bearingless rotor
[NASA-CR-166280] N82-17154
ROTARY WINGS
Design requirements for modern rescue helicopters
A82-19020
Fatigue behavior of selected non-woven fiber composites for helicopter rotor blades
A82-20524
Predesign study for a modern 4-bladed rotor for the NASA rotor systems research aircraft
[NASA-CR-166153] N82-16042
Pre-design study for a modern four-bladed rotor for the Rotor System Research Aircraft (RSRA) --- integrating the YAH-64 main rotor
[NASA-CR-166154] N82-16043
Ice phobics blade tracking and comparison of vibration analysis techniques
[AD-A108121] N82-16074
Blade planform for a quiet helicopter
[NASA-CR-166256] N82-17121
Roll up model for rotor wake vortices, part 5
[ASRL-TR-194-4] N82-17127
Development of a computer based presentation of non-steady helicopter rotor flows
[AD-A108107] N82-17131
Rotor flow research in low speed helicopter flight
[AD-A107873] N82-17132
Non-steady velocity measurement of the wake of a helicopter rotor at low advance ratios
[AD-A107722] N82-17133
ROTATING DISKS
Natural frequencies of rotating bladed discs using clamped-free blade modes
[ASME PAPER 81-DET-124] A82-19338
On the formulation of coupled/uncoupled dynamics analyses of blade-disc assemblies
[ASME PAPER 81-DET-126] A82-19340
An investigation of dual mode phenomena in a mistuned bladed-disk
[ASME PAPER 81-DET-133] A82-19347
Measurement of the influence of flow distortions on the blade vibration amplitude in an air turbine
[ASME PAPER 81-DET-135] A82-19348
A parametric study of dynamic response of a discrete model of turbomachinery bladed disk
[ASME PAPER 81-DET-137] A82-19349
ROTATING STALLS
Rotating stall in blade rows operating in shear flow
A82-22209
Axial compressor stall and surge
N82-17194
ROTOR AERODYNAMICS
Study of controlled diffusion stator blading. 1. Aerodynamic and mechanical design report
[NASA-CR-165500] N82-16081
Dynamic analysis of a rotor blade with flap and lag freedom and flap-pitch coupling
[ISD-271] N82-17641
Static and dynamic investigations for the model of a wind rotor
[ISD-272] N82-17642
ROTOR BLADES (TURBOMACHINERY)
Natural frequencies of rotating bladed discs using clamped-free blade modes
[ASME PAPER 81-DET-124] A82-19338
Study of controlled diffusion stator blading. 1. Aerodynamic and mechanical design report
[NASA-CR-165500] N82-16081
Part span damper loss prediction for transonic axial fan rotors
N82-17192
Deviation/turning angle correlations
N82-17193
Static investigations of rotor blades under deadweight and during stationary operation
[ISD-269] N82-17639
Loading cycles and material data for the layout of a wind turbine of special hub concept
[ISD-273] N82-17643
ROTOR SPEED
Problems of engine response during transient maneuvers
N82-17221
ROTOR SYSTEMS RESEARCH AIRCRAFT
Pre-design study for a modern four-bladed rotor for the Rotor System Research Aircraft (RSRA) --- integrating the YAH-64 main rotor
[NASA-CR-166154] N82-16043
ROTORCRAFT AIRCRAFT
The emerging need for improved helicopter navigation
A82-21591
Assessment of historical and projected segments of US and World civil and military rotorcraft markets 1960 - 1990
[NASA-CR-166151] N82-17137
Preliminary design study of a hybrid airship for flight research
[NASA-CR-166246] N82-17152
ROTORS
Balancing of flexible rotors by the complex modal method
[ASME PAPER 81-DET-46] A82-19310
Optimum journal bearing parameters for minimum rotor unbalance response in synchronous whirl
[ASME PAPER 81-DET-55] A82-19314
Rotor model for the verification of computational methods
[ISD-275] N82-17638
Loading cycles and material data for the layout of a wind turbine of special hub concept
[ISD-273] N82-17643
ROUTES
FAA/NWS aviation route forecast /ARF/ development
[AIAA PAPER 82-0013] A82-22027
RUN TIME (COMPUTERS)
Utilization of hybrid computational equipment for the simulation of parachute system flight
A82-19234
RUNWAY CONDITIONS
Community sensitivity to changes in aircraft noise exposure
[NASA-CR-3490] N82-16807

PERSONAL AUTHOR INDEX

AERONAUTICAL ENGINEERING/*A Continuing Bibliography (Suppl. 148)* **MAY 1982**

Typical Personal Author index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The accession number is located beneath and to the right of the title, e.g., N82-11514. Under any one author's name the accession numbers are arranged in sequence with the *IAA* accession numbers appearing first.

A

ABBOTT, W. Y.
Ice phobics blade tracking and comparison of vibration analysis techniques
[AD-A108121] N82-16074

ABEYOUNIS, W. K.
Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts
[AIAA PAPER 82-0255] A82-22077

ABRAMS, L. R.
Differential Omega system development and evaluation
[AD-A107857] N82-17146

ADKINS, A.
Active beacon collision avoidance logic evaluation. Volume 2: Collision avoidance (BCAS) threat phase
[AD-A107805] N82-17148

AHMADI, A. R.
Unsteady lifting-line theory with applications
[AIAA PAPER 82-0354] A82-19798

AICHER, W.
Rotor model for the verification of computational methods
[ISD-275] N82-17638

ALBRECHT, C.
Engine/drive/airframe compatibility: A way of life N82-17220

ALDERMAN, J.
Technology overview for advanced aircraft armament system program
[AD-A107680] N82-17155

ALIAGA, D.
Corrosion fatigue behaviour of some aluminium alloys N82-17345

ALLEN, J.
Comparison of two parallel/series flow turbofan propulsion concepts for supersonic V/STOL
[AIAA PAPER 81-2637] A82-19214

ALVERYD, A.
Ambulance helicopter in the Stockholm archipelago A82-19005

ANDERSON, D. A.
A split coefficient/locally monotonic scheme for multishocked supersonic flow
[AIAA PAPER 82-0287] A82-22082

ANSELL, G. S.
Composite structural materials
[NASA-CR-165121] N82-16182

AOYAGI, K.
Experimental investigation of a jet inclined to a subsonic crossflow
[AIAA PAPER 81-2610] A82-19202
Application of thrusting ejectors to tactical aircraft having vertical lift and short-field capability
[AIAA PAPER 81-2629] A82-19211

ARGYRIS, J. H.
Rotor model for the verification of computational methods
[ISD-275] N82-17638
Static investigations of rotor blades under deadweight and during stationary operation
[ISD-269] N82-17639
Stability and response to gravity of the flap lag motion for a rigid rotor blade with flap-pitch coupling
[ISD-270] N82-17640
Dynamic analysis of a rotor blade with flap and lag freedom and flap-pitch coupling
[ISD-271] N82-17641
Static and dynamic investigations for the model of a wind rotor
[ISD-272] N82-17642
Loading cycles and material data for the layout of a wind turbine of special hub concept
[ISD-273] N82-17643

ARKIND, K. D.
Broader bandwidth for thin conformal antennas A82-19069

ARP, H.
Mapping in tropical forests - A new approach using the laser APR A82-20407

ARTHUR, S.
Ice phobics blade tracking and comparison of vibration analysis techniques
[AD-A108121] N82-16074

ATENCIO, A., JR.
Comparison of acoustic data from a 102 mm conic nozzle as measured in the RAE 24-foot wind tunnel and the NASA Ames 40- by 80-foot wind tunnel
[NASA-TM-81343] N82-16083

ATROTT, H. H.
Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports A82-19001

AUER, L. M.
Helicopter secondary applications for neurotraumatic emergencies A82-19015

AUMILLER, H.
Airborne measurements with a sensitive high resolution 90 GHz radiometer A82-18940

AUSHERMAN, D. W.
Measurements of a three-dimensional boundary layer on a sharp cone at Mach 3
[AIAA PAPER 82-0289] A82-22083

AVERY, J. G.
Design Manual for impact damage tolerant aircraft structure
[AGARD-AG-238] N82-17160

AZAGOURY, M.
The use of adaptive control for helicopter trajectories in search operations A82-19065

AZUMA, T.
Balancing of flexible rotors by the complex modal method
[ASME PAPER 81-DET-46] A82-19310

PINES, S.
Terminal area automatic navigation, guidance, and control research using the Microwave Landing System (MLS). Part 3: A comparison of waypoint guidance algorithms for RNAV/MLS transition
[NASA-CR-3512] N82-16060
Terminal area automatic navigation, guidance, and control research using the Microwave Landing System (MLS). Part 2: RNAV/MLS transition problems for aircraft
[NASA-CR-3511] N82-17142
PIPES, R. B.
Design of the composite spar-wingskin joint
A82-20128
PISANO, A.
Ground effect hover characteristics of a large-scale twin tilt-nacelle V/STOL model
[AIAA PAPER 81-2609] A82-19201
PLATZ, K.
The significance of electronics for air traffic control at the present time and in the future
A82-19649
PO-CHEDLEY, D. A.
Aircraft alerting systems standardization study. Volume 2: Aircraft alerting system design guidelines
[AD-A106732] N82-16077
POTH, G. E.
Tactical STOL moment balance through innovative configuration technology
[AIAA PAPER 81-2615] A82-19204
PREOBRAZHENSKII, I. N.
Studies on the stability of thin-walled shells with cutouts /Review/. I
A82-21629
PRESZ, W. M., JR.
Isolated nacelle performance - Measurement and simulation
[AIAA PAPER 82-0134] A82-22054
PRICE, D. B.
Piloted simulation of an on-board trajectory optimization algorithm
A82-20296
PRIESTLEY, R. T.
Sea based support aircraft alternatives
[AIAA PAPER 81-2649] A82-19217
PYE, C. R.
Detection and prevention of corrosion in Royal Air Force aircraft
N82-17351

Q

QUEAU, J. P.
Optimal shape design of turbine blades
[ASME PAPER 81-DET-128] A82-19342
QUINN, B.
Resonance tests on a Piper PA-32R tailplane before and after damage
[AD-A106273] N82-16071
QUINTO, P. F.
Thrust-induced effects on low-speed aerodynamics of fighter aircraft
[AIAA PAPER 81-2612] A82-19203

R

RABONE, D. J.
Intake design with particular reference to ice protection and particle separators
N82-17218
RAM, D. S. J.
Blade planform for a quiet helicopter
[NASA-CR-166256] N82-17121
RANDALL, C. C.
Turboprop cargo aircraft systems study
[NASA-CR-165813] N82-16070
RANDALL, T. M.
Color graphics based real-time telemetry processing system
A82-20771
RANKEN, G. B. F.
Offshore uses of the airship
A82-20553
RAO, D. M.
Alleviation of the subsonic pitch-up of delta wings
[AIAA PAPER 82-0129] A82-22052
RAO, J. S.
Optimum journal bearing parameters for minimum rotor unbalance response in synchronous whirl
[ASME PAPER 81-DET-55] A82-19314
RAWLINGS, R. C.
The FS2 RAE Bedford civil flight research programme
A82-20519
RAYMER, D. P.
Configuration Development System/NAVAIR Report
[AD-A106727] N82-16072
REGELIN, K.
Airbus Industrie - The year of progress
A82-21189

Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 359-368.

Selection criteria for the pressing processes in manufacturing stretched acrylic from as-cast billets at the Lucas facility are discussed. Advantages of a press over gripping around the edges include more parallel surfaces, better yield from the material, and the avoidance of sheet splitting which sometimes occurs when the material is stretched. Specifications for stretched acrylic are discussed, and the facility is described, including a discussion of the stretching press and the grinding/polishing machines. The planned expansion of the facility is also discussed, which includes the introduction of a pre-heater and additional polishing machines. D.L.G.

A82-24319 **Problems associated with the quality assurance of stretched acrylic sheet.** R. L. Worsdall (Ministry of Defence /Procurement Executive/, Material Quality Assurance Directorate, London, England). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 371-397.

A description is presented of special problems arising in connection with an application of a manufacturer for Type Approval of a material intended for defense-related uses, taking into account the approaches employed to solve these problems. The material involved was stretched acrylic sheet. There were differences between test results obtained in the laboratories of the manufacturer and the Materials Quality Assurance Directorate. The differences were, in particular, observed in thermal relaxation studies, and increased as the thickness of the sheets examined became progressively larger. In an investigation of the reasons for these differences, it was found that in the conduction of thermal relaxation studies the temperature control is important and the moisture content is critical. An important factor is also the position from which the sample is taken in the sheet. G.R.

A82-24320 **The effects of absorbed moisture upon the physical properties of stretched acrylic materials.** A. J. Mason (British Aerospace Public, Ltd., Co., Materials Laboratory, Weybridge, Surrey, England). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 399-416. Research supported by the Ministry of Defence (Procurement Executive).

It is noted that stretched acrylic materials are often preferred to 'as-cast' acrylics for the manufacture of aircraft transparencies owing to their superior craze and crack propagation resistance. However, the service performance of stretched acrylics can be affected by their operational environment. The effects of absorbed moisture upon various physical properties of stretched acrylic materials, including thermal relaxation, surface shrinkback, solvent craze resistance, crack propagation resistance, and surface hardness, are described. It is pointed out that the base stock material and method of stretching may also influence physical properties. These have been assessed by including in the evaluation three materials that have been manufactured from two base stock materials and produced by two manufacturing techniques. C.R.

A82-24323 **The development of high strength light-weight windshields for the new generation of Boeing 757 and 767 airliners.** R. W. Wright (Triplex Safety Glass Co., Ltd., Aircraft and Special Products Div., Birmingham, England). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 533-548.

Windshields based on multilaminate construction and electroconductive coatings were introduced in the 1970s on such aircraft as the Concorde, A300B, de Havilland Canada Dash 7, and Boeing 747. In all, more than 20,000 hours of flight have been recorded. The way in which this technology is being adapted to meet the needs of the new Boeing 757 and 767 aircraft, where weight saving and reliability are fundamental requirements, is discussed. A description is also given of design, development and qualification test features. C.R.

A82-24324 **D.C.9 windshield - Effect of attachment retorque.** J. Christensen (Scandinavian Airlines System, Copenhagen, Denmark). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 549-562.

Reference is made to a paper by Christensen (1978) propounding a theory related to the influence of attachment method on failures for D.C. 8-60 and D.C.9 winshields. The experience of regular retorquing of attachment fasteners on Scandinavian Airlines System aircraft is reported. It is noted that this has had a marked effect on reducing windshield failures. Further expected improvements are discussed. C.R.

A82-24325 **B.A.C. One-Eleven flight deck glazing product improvement.** J. F. Russell (British Aerospace Public, Ltd., Co., Weybridge, Surrey, England). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p.563-576.

The modifications described include recessed bus-bars, fiberglass chip retarders, and the introduction of additional interlayer plies of a new material, all for the windshield. Another modification involved moving the de-mist film on the side windows from one glass ply to another. It is noted that, altogether, these modifications have led to a doubling of the windshield MTBF in eight years and to a great improvement in the side windows. C.R.

A82-24326 **Concorde glazings - 5 years of Mach 2 service.** W. P. C. Soper and R. A. Brown (British Aerospace Public, Ltd., Co., Bristol, England). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 577-601.

A description is provided of the level of achievement obtained with respect to the transparencies of the Concorde project. Aircraft operating conditions are considered. It is pointed out that the transparency configuration was conceived such that the aircraft would key into the normal operating pattern of conventional jet transport traffic and that no preferential treatment would be needed. The visor panels of the aircraft are discussed, taking into account the current visor panel construction, aspects of cyclic testing, flight testing, alternative panel designs, and in-service performance. Attention is also given to the forward main windscreen, the D.V. and aft side windows, and the Series aircraft cabin window. G.R.

A82-24338 # **Air transportation of handicapped persons (Le transport aérien des handicapés).** E. Mapelli (Iberia Lineas Aéreas de España, Madrid, Spain). In: Annals of air and space law. Volume 5. Toronto, Carswell Co., Ltd.; Paris, Editions A. Pedone, 1980, p. 171-188. 16 refs. In French.

Various legal aspects of the air transportation of handicapped persons are reviewed. Consideration is given to the rights and obligations of passengers as they pertain to the handicapped, the physical ability of passengers to travel on aircraft and the right of carriers to exclude the handicapped, obligations of the carrier in relation to the handicapped passenger, and carrier liability in relation to the injury of a handicapped passenger. B.J.

A82-24354 **The coupling of electromagnetic interference into aircraft systems.** R. V. Pankhurst (Aeroplane and Armament Experimental Establishment, Boscombe Down, Wilts., England). In: Conference on Electromagnetic Compatibility, Southampton, England, September 16-18, 1980, Proceedings. London, Institution of Electronic and Radio Engineers, 1980, p. 117-128.

Results of tests performed to determine the electromagnetic transfer function for complete aircraft from 100 kHz to 250 MHz are presented. The current distribution within the wiring bundle is shown along with the effect of end terminations, and attention is given to the variability between aircraft of the same type and aircraft of different types. Also considered are the developing overall picture of these induced currents and the implications of these results for future clearance work as well as for the usefulness of this information to aircraft systems and equipment designers. B.J.

A82-24355 **The variation of induced currents in aircraft wiring.** P. M. Newton (Ministry of Defence /Procurement Executive/, London, England). In: Conference on Electromagnetic Compatibility, Southampton, England, September 16-18, 1980, Proceedings. London, Institution of Electronic and Radio Engineers, 1980, p. 129-134.

The paper examines the use of the bulk current method to measure the variation of induced currents in aircraft wiring due to the operation of onboard transmitters and the variation of the RF environment. The measurement method is described and typical results of aircraft samples to date are discussed. Results to date have shown that current varies by a factor of three and the RF environment on the average by a factor of two. B.J.

A82-24357 **MIL-STD 1553B - Aircraft EM environmental susceptibility effects.** G. Gerbi and E. R. Totto (Aeritalia S.p.A., Turin, Italy). In: Conference on Electromagnetic Compatibility, Southampton, England, September 16-18, 1980, Proceedings. London, Institution of Electronic and Radio Engineers, 1980, p. 147-155.

The subject of this paper is the technology applied to aircraft to minimize EMI in the installation of MIL-STD-1553B digital transmission links. The electromagnetic interference generators normally installed on aircraft are considered, and the susceptibility of a typical MIL-STD-1553B data link is investigated. Experimental tests and computer aided analysis using the SEMCAP program, which have been performed for simple geometrical coupling models, are described. The results of this work give practical indications about the influence of mechanical and electrical harness parameters on EMC aspects of the aircraft installation of MIL-STD-1553B digital transmission lines. A good architecture for digital data link installations is also discussed. (Author)

A82-24358 **Materials aspects of aircraft EMC design.** M. W. Baskerville and J. Brettle (Plessey Research /Caswell/, Ltd., Allen Clark Research Centre, Towcester, Northants., England). In: Conference on Electromagnetic Compatibility, Southampton, England, September 16-18, 1980, Proceedings. London, Institution of Electronic and Radio Engineers, 1980, p. 157-170. Research supported by the Ministry of Defence (Procurement Executive).

The effect of materials, construction methods, and corrosion protection schemes on the dc and RF impedance of structural and electrical joints in aircraft is considered. The development of the theory and practice of making resistance measurements in large structures is examined in the light of a survey of bond resistance measurements in service aircraft. It is shown that the resistance of structural and electrical bonds in aircraft is critically dependent on a number of variables, including the type of fastener used, materials, and conditions of the relevant surfaces. It is possible to choose a set of variables which give a low bond resistance which is constant with time even when exposed to corrosion conditions. B.J.

A82-24359 **EMC clearance of modern military aircraft.** I. P. Macdiarmid and D. M. Wormstone (British Aerospace Public, Ltd., Co., Military Aircraft Div., Warton, Lancs., England). In: Conference on Electromagnetic Compatibility, Southampton, England, September 16-18, 1980, Proceedings. London, Institution of Electronic and Radio Engineers, 1980, p. 171-182. Research supported by the British Aerospace Public, Ltd., Co.

An approach to EMC testing which was recently adopted on a production version of a modern strike aircraft is described. The procedure involved: a quantitative assessment of the switching transients occurring on bus bars and selected signal lines; an interaction test whereby each potentially susceptible system must be observed while other systems are operated in their most emissive modes; a study of the safety margin of the compatibility of aircraft systems with intentional onboard transmitters; an investigation of the compatibility of the aircraft systems with the external RF environment; a quantitative assessment of the extent of data corruption at transducer-computer interfaces due to onboard emissive sources; and an in-depth compatibility study of all onboard RF equipment. The methods used and the results obtained were considered adequate to provide an assessment of the EMC of the onboard systems; however, it is noted that the demonstration of compatibility could be improved in certain areas. B.J.

A82-24361 **The testing of aircraft under near field conditions.** M. Elliott (Aeroplane and Armament Experimental Establishment, Boscombe Down, Wilts., England). In: Conference on Electromagnetic Compatibility, Southampton, England, September 16-18, 1980, Proceedings. London, Institution of Electronic and Radio Engineers, 1980, p. 199-206.

Although the HF band is of considerable interest in external field EMC testing, the environment in a typical trials facility is highly complex in this frequency range. This is due to operation in the near field region of the transmitting antenna, the proximity of the ground, and the presence of the fields scattered by the object under test. This problem was investigated by comparing the surface currents induced by three near field sources and one far field source on a cylinder which modeled the aircraft. The effects of the orientation of the cylinder on the measured magnetic and electric components of the field are examined, and optimum positions and methods of field measurements are discussed. B.J.

A82-24371 **Managing computer aided design; Proceedings of the Conference, London, England, November 19, 1980.** Conference sponsored by Institution of Mechanical Engineers. London, Mechanical Engineering Publications, Ltd. (I Mech E Conference Publications 1980-8), 1980. 51 p. $30.

Papers are presented on the problems encountered by the incorporation of computer-aided design and computer-aided manufacturing (CAD/CAM) systems into the process industries, such as aircraft manufacture and chemical production, in Britain. Attention is given to the use of CAD graphics by a mechanical engineering firm, the successful management of CAD, the use of CAD/CAM electronic data transfer to integrate geographically distributed aircraft production, experience with computer-aided building design system in an architectural firm, the acceptance of interactive graphics by industry, and the relation between the financial productivity impact of CAD/CAM and labor relations. O.C.

A82-24373 **CAD/CAM in British Aerospace - Aircraft Group.** J. S. Rawlins (British Aerospace Public, Ltd., Co., Aircraft Group, Kingston-on-Thames, Surrey, England). In: Managing computer aided design; Proceedings of the Conference, London, England, November 19, 1980. London, Mechanical Engineering Publications, Ltd., 1980, p. 27-34.

The use of computer-aided design and computer-aided manufacturing (CAD/CAM) techniques in aspects of aircraft structure geometry and electrical system definition is described for the case of the BAe 146 commuter aircraft. The use of electronic design and production data transfer is especially important in aircraft industry projects of the kind described because of the geographical distribution of component fabrication and assembly facilities. Emphasis is put on the ability of a CAD/CAM system to make information promptly available, from the conceptual design to the in-service product support stages, without need for manual transcription before distribution. O.C.

A82-24376 **Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981.** Congress sponsored by the Society of Automotive Engineers. Warrendale, PA, Society of Automotive Engineers, Inc., 1981. 90 p. $18.
(SAE SP-500)

The design, testing, maintenance, requirements, and future needs for aircraft power supplies were covered. Specific attention was given to design considerations of DC-Link aircraft generator systems and to cost of ownership advantages such as weight reduction and maintainability with a shared-oil system. Considerations for the design of variable speed, constant frequency (VSCF) generators are presented, and advanced generating systems technology was discussed. The effect of critical design parameters on the selection of a VSCF system was examined, along with the evolution and development of high voltage (270 V), dc aircraft electric systems and packaging the VSCF system for a military aircraft environment. Finally, the development of an aircraft electric system test facility was detailed. M.S.K.

Influence of correlations and computational methods on the prediction of overall efficiency N82-17180
The two stage aero engine turbine N82-17183
Survey on diffusion factors and profile losses N82-17186

COMPUTER GRAPHICS
Simulation of advanced cockpits A82-19259
Requirements regarding digital external view systems for full mission flight and tactics simulators [DGLR PAPER 81-100] A82-19267
Data base generation for digital external view systems [DGLR PAPER 81-101] A82-19270
A CAD/CAM graphics system with relative datums and tolerances [ASME PAPER 81-DET-108] A82-19333
Computer graphics for quality assurance A82-20276
Graphics in numerical control - The user's challenge A82-20277
The future of integrated CAD/CAM systems - The Boeing perspective A82-20278
Color graphics based real-time telemetry processing system A82-20771
Flow visualization using a computerized data acquisition system A82-20792
Configuration Development System/NAVAIR Report [AD-A106727] N82-16072
Development of a computer based presentation of non-steady helicopter rotor flows [AD-A108107] N82-17131
Terrain model animation [AD-A107911] N82-17887

COMPUTER NETWORKS
Real-Time Simulation Computation System --- for digital flight simulation of research aircraft A82-19260
Reconfiguration: A method to improve systems realiability N82-17107
A reconfigurable change network for distributed process control N82-17108
SIFT: An ultra-reliable avionic computing system N82-17115
F/A-18A tactical airborne computational subsystem N82-17119

COMPUTER PROGRAMMING
Programs for the transonic wind tunnel data processing installation. Part 9: Pressure measurements updated [AD-A106271] N82-16095

COMPUTER PROGRAMS
Utilization of hybrid computational equipment for the simulation of parachute system flight A82-19234
KC-135 avionics modernization hot bench - An evaluation of requirements and design for the future A82-19244
CAD/CAM approach to improving industry productivity gathers momentum A82-21375
A generalized escape system simulation computer program: A user's manual [AD-A106152] N82-16055
Research and development program for non-linear structural modeling with advanced time-temperature dependent constitutive relationships [NASA-CR-165533] N82-16080
Software considerations in airborne systems and equipment certification [RTCA/DO-178] N82-16759
Prediction of sound radiation from different practical jet engine inlets [NASA-CR-165120] N82-16810
Function specifications for the A-7E Function Driver module [AD-A107922] N82-17173
Results of calculations N82-17198
Investigation and evaluation of a computer program to minimize three-dimensional flight time tracks [NASA-CR-168419] N82-17879

COMPUTER SYSTEMS DESIGN
Digital Avionics Information System (DAIS): Development and demonstration [AD-A107906] N82-16079
Distributed data processing: What is it? N82-17087
The effect of increasingly more complex aircraft and avionics on the method of system design N82-17088
Stage-state reliability analysis technique N82-17104
Digital Avionics Information System (DAIS) documentation [AD-A108000] N82-17172

COMPUTER SYSTEMS PERFORMANCE
Distributed data processing: What is it? N82-17087

COMPUTER SYSTEMS PROGRAMS
Methodology for measurement of fault latency in a digital avionic miniprocessor N82-17105
Hierarchical specification of the SIFT fault tolerant flight control system N82-17106

COMPUTER SYSTEMS SIMULATION
Methodology for measurement of fault latency in a digital avionic miniprocessor N82-17105

COMPUTERIZED DESIGN
A fuel control system designers approach to gas turbine engine computer model validation A82-19253
A CAD/CAM graphics system with relative datums and tolerances [ASME PAPER 81-DET-108] A82-19333
Application of structural optimization technique to reduce the external vibrations of a gas-turbine engine [ASME PAPER 81-DET-143] A82-19351
Computer graphics for quality assurance A82-20276
Graphics in numerical control - The user's challenge A82-20277
The future of integrated CAD/CAM systems - The Boeing perspective A82-20278
CAD/CAM approach to improving industry productivity gathers momentum A82-21375
Integration of a code for aeroelastic design of conventional and composite wings into ACSYNT, an aircraft synthesis program --- wing aeroelastic design (WADES) [NASA-CR-137805] N82-16069
Configuration Development System/NAVAIR Report [AD-A106727] N82-16072
A computer program for variable-geometry single-stage axial compressor test data analysis (UD0400) [AD-A106676] N82-16086
Parallel computation for developing nonlinear control procedures [AD-A107914] N82-17227

COMPUTERIZED SIMULATION
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation [AIAA PAPER 81-2663] A82-19221
Utilization of hybrid computational equipment for the simulation of parachute system flight A82-19234
KC-135 avionics modernization hot bench - An evaluation of requirements and design for the future A82-19244
Radar environment simulation for software test A82-19245
SIMATE - An air battle simulation of the USAF Tactical Air Control System /TACS/ with Advanced Tactical Radars A82-19256
Simulation of advanced cockpits A82-19259

Development of a digital integrated automatic landing system /DIALS/ for steep approach and landing
A82-20297
A perspective of computational aerodynamics from the viewpoint of airplane design applications
[AIAA PAPER 82-0018] A82-22028
Isolated nacelle performance - Measurement and simulation
[AIAA PAPER 82-0134] A82-22054
A generalized escape system simulation computer program: A user's manual
[AD-A106152] N82-16055
Research through simulation --- simulators and research applications at Langley
[NASA-FACTS-125] N82-16092
Implementation of the recommendations made on the technical report titled analysis of advanced simulator for pilot training
[AD-A106779] N82-16094
Analytical study of twin-jet shielding
[NASA-CR-165105] N82-16804
A simple hybrid visual simulation for research flight simulators
[ESA-TT-690] N82-17232
Terrain model animation
[AD-A107911] N82-17887

CONFERENCES
Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports
A82-19001
Trends in aviation fuels and lubricants; Proceedings of the West Coast International Meeting, Seattle, WA, August 3-6, 1981
A82-19621
Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981
A82-20513
Pactec V - Plastics technology advances/1980 update; Proceedings of the Fifth Annual Pacific Technical Conference, Los Angeles, CA, February 26-28, 1980. Volume 3
A82-20521
Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981
A82-20526
Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980
A82-20540
Airships and their maritime applications; Proceedings of the Symposium, London, England, March 10, 1981
A82-20551
Design for military aircraft operability; Proceedings of the Symposium, London, England, February 7, 1980
A82-20560
Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980
A82-20751
Institute of Navigation, Annual Meeting, 36th, U.S. Naval Postgraduate School, Monterey, CA, June 23-26, 1980, Proceedings
A82-21586
Symposium on commercial-aviation energy-conservation strategies
[DE81-028406] N82-16057
Corrosion Fatigue --- conferences
[AGARD-CP-316] N82-17342
Aircraft Corrosion
[AGARD-CP-315] N82-17349

CONICAL FLOW
Use of high conical flow theory for the determination of the pressure distribution on the wave rider and its agreement with experimental results for supersonic flow
A82-19197
Finite difference computation of the conical flow field over a delta wing
[VKI-TN-140] N82-17135

CONICAL NOZZLES
Comparison of acoustic data from a 102 mm conic nozzle as measured in the RAE 24-foot wind tunnel and the NASA Ames 40- by 80-foot wind tunnel
[NASA-TM-81343] N82-16083

CONSOLES
Flight simulation consoles, aid or obstruction - Objective evaluation of control consoles of modern flight and tactics simulators
[DGLR PAPER 81-097] A82-19269

CONTROL EQUIPMENT
Current pressure measuring system in the transonic wind tunnel
[AD-A106272] N82-16096

CONTROL SIMULATION
The use of adaptive control for helicopter trajectories in search operations
A82-19065
Modelling of target radar scattering with application to guidance simulation
A82-20570
Propulsion system controls design and simulation
[AIAA PAPER 82-0322] A82-22091
The simulation study on a redundant flight control system
A82-22120

CONTROL STICKS
Ground calibration of a strain-gauged CT-4A aircraft (1979)
[AD-A107847] N82-16073

CONTROL SURFACES
A program to evaluate a control system based on feedback of aerodynamic pressure differentials
[NASA-CR-163466] N82-16089

CONTROL THEORY
An application of total synthesis to robust coupled design --- turbojet engine control
A82-19061
Parallel computation for developing nonlinear control procedures
[AD-A107914] N82-17227

CONTROLLABILITY
Analytical control law for desirable aircraft lateral handling qualities
A82-21941
Stiffness degradation of impact damaged structure
N82-17166

CONTROLLERS
An investigation of multi-axis isometric side-arm controllers in a variable stability helicopter
[AD-A106759] N82-17226

CONVERGENCE
Requirements for instrument approaches to converging runways
[AD-A108075] N82-17144

CONVERGENT NOZZLES
Pressure dependence of jet noise and silencing of blow-offs
A82-20266

CORNER FLOW
Dilution jet behavior in the turn section of a reverse flow combustor
[AIAA PAPER 82-0192] A82-20291

CORROSION
Aircraft Corrosion
[AGARD-CP-315] N82-17349
US Naval fleet aircraft corrosion
N82-17350
An airline view of the corrosion problem
N82-17352
Some observations on the corrosion of aircraft at the air force base in Bandirma, Turkey
N82-17353
On the Corrosion problems of the TAF F-5 aircraft
N82-17354
The experience of corrosion on French military aerodynes
N82-17355
Design and maintenance against corrosion of aircraft structures
N82-17356

CORROSION PREVENTION
Corrosion Fatigue --- conferences
[AGARD-CP-316] N82-17342
Mechanisms of corrosion fatigue --- of high strength aluminum alloys
N82-17343

Helicopters - Night operations
A82-19017
Problems pertaining to aeronautical technology in the case of rescue operations with helicopters in mountainous areas
A82-19018
The helicopter in rescue operations in high-mountain areas
A82-19019
The case for helicopter hoisting
A82-21597
Problems of engine response during transient maneuvers
N82-17221
An alternative approach to engineering structures using monitoring systems
N82-17223
Component research for future propulsion systems
N82-17224

HELICOPTER PROPELLER DRIVE
Application of the principle of reciprocity to flexible rotor balancing
[ASME PAPER 81-DET-49] A82-19311
Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980
A82-20540
Airworthiness of helicopter transmissions
A82-20541
Helicopter transmission philosophy - The way ahead
A82-20546
Helicopter Propulsion Systems
[AGARD-CP-302] N82-17203
Lubrication breakdown between gear teeth
N82-17213
Advanced transmission component development
N82-17214
Design Criteria of the A 129 helicopter drive system
N82-17215
Engine/drive/airframe compatibility: A way of life
N82-17220
Future requirements for helicopter propulsion systems
N82-17225

HELICOPTER WAKES
Development of a computer based presentation of non-steady helicopter rotor flows
[AD-A108107] N82-17131
Rotor flow research in low speed helicopter flight
[AD-A107873] N82-17132
Non-steady velocity measurement of the wake of a helicopter rotor at low advance ratios
[AD-A107722] N82-17133

HELICOPTERS
Ambulance helicopter in the Stockholm archipelago
A82-19005
Aerial ambulance service in Australia
A82-19007
Air ambulance systems in the Republic of South Africa
A82-19009
Modal analysis using helicopter dynamic test data
[ASME PAPER 81-DET-30] A82-19306
The application of condition monitoring --- commercial helicopter in-service maintenance
A82-20542
Quick learning diagnostics --- helicopter vibration analysis and component condition monitoring
A82-20543
On-site vibration measurement, dynamic tracking and balancing
A82-20545
Helicopter icing spray system
A82-20754
Test and evaluation of improved aircrew restraint systems
[AD-A107576] N82-16056
Blade planform for a quiet helicopter
[NASA-CR-166256] N82-17121
Assessment of historical and projected segments of US and World civil and military rotorcraft markets 1960 - 1990
[NASA-CR-166151] N82-17137

HETEROCYCLIC COMPOUNDS
Deposit formation in liquid fuels. II - The effect of selected compounds on the storage stability of Jet A turbine fuel
A82-22240

HIERARCHIES
Hierarchical specification of the SIFT fault tolerant flight control system
N82-17106

HIGH PRESSURE
CF6 jet engine performance improvement: High pressure turbine roundness
[NASA-CR-165555] N82-17174

HIGH STRENGTH ALLOYS
Superplastic aluminum evaluation
[AD-A107760] N82-17338

HOLOGRAPHIC INTERFEROMETRY
An investigation of dual mode phenomena in a mistuned bladed-disk
[ASME PAPER 81-DET-133] A82-19347

HOMING DEVICES
A terminal guidance simulator for evaluation of millimeter wave seekers
A82-18937

HONEYCOMB STRUCTURES
Some observations on the corrosion of aircraft at the air force base in Bandirma, Turkey
N82-17353
The experience of corrosion on French military aerodynes
N82-17355

HORIZONTAL ORIENTATION
Static investigations of rotor blades under deadweight and during stationary operation
[ISD-269] N82-17639

HORIZONTAL TAIL SURFACES
Basic studies of the flow fields of airfoil-flap-spoiler systems
[AIAA PAPER 82-0173] A82-22060
High angle-of-attack characteristics of three-surface fighter aircraft --- canard-wing-horizontal tail configuration for greater stability and control
[AIAA PAPER 82-0245] A82-22074
Ground calibration of a strain-gauged CT-4A aircraft (1979)
[AD-A107847] N82-16073

HOT CORROSION
Improved plasma sprayed MCrAlY coatings for aircraft gas turbine applications
A82-20742

HOT PRESSING
Fabrication of boron/aluminum fan blades for SCR engines
[NASA-CR-165294] N82-16176

HOT-FILM ANEMOMETERS
Rotor flow research in low speed helicopter flight
[AD-A107873] N82-17132
Non-steady velocity measurement of the wake of a helicopter rotor at low advance ratios
[AD-A107722] N82-17133

HOVERING
Ground effect hover characteristics of a large-scale twin tilt-nacelle V/STOL model
[AIAA PAPER 81-2609] A82-19201

HUMAN FACTORS ENGINEERING
Spectrally balanced chromatic landing approach lighting system
[NASA-CASE-ARC-10990-1] N82-16059
Aircraft alerting systems standardization study. Volume 2: Aircraft alerting system design guidelines
[AD-A106732] N82-16077

HUMAN REACTIONS
Community sensitivity to changes in aircraft noise exposure
[NASA-CR-3490] N82-16807
Noise impact on communities from aircraft
[GPO-80-617] N82-17655

HYBRID COMPUTERS
Utilization of hybrid computational equipment for the simulation of parachute system flight
A82-19234

HYDRAULIC EQUIPMENT
Surveys of flow-field around empennage of the NAL STOL-research-aircraft model
[NAL-TR-677] N82-17124

HYDROCARBON COMBUSTION
The sooting tendency of fuels containing polycyclic aromatics in a research combustor
[AIAA PAPER 82-0299] A82-19791
Fuel property effects on radiation intensities in a gas turbine combustor
A82-19966

HYDROCRACKING
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes [DE82-001127] N82-17401
HYDRODYNAMIC RAM EFFECT
Hydrodynamic ram damage N82-17166
HYDROFOILS
Accidents of surface effect ships and hydrofoil craft --- Russian book A82-18899
HYDROGEN FUELS
The prospects for liquid hydrogen fueled aircraft A82-20137
HYDROGENATION
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes [DE82-001127] N82-17401
HYPERSONIC FLIGHT
Use of high conical flow theory for the determination of the pressure distribution on the wave rider and its agreement with experimental results for supersonic flow A82-19197
HYPERSONIC FLOW
Real gas flows over complex geometries at moderate angles of attack [AIAA PAPER 82-0392] A82-19801
HYPERVELOCITY IMPACT
Description of projectile threats N82-17161
Hydrodynamic ram damage N82-17166

I

ICE FORMATION
F-16 ground and inflight icing testing A82-20753
Helicopter icing spray system A82-20754
Aerodynamic characteristics of airfoils with ice accretions [AIAA PAPER 82-0282] A82-22081
Aircraft icing avoidance and protection [PB82-108135] N82-17139
Intake design with particular reference to ice protection and particle separators N82-17218
ICE PREVENTION
Ice phobics blade tracking and comparison of vibration analysis techniques [AD-A108121] N82-16074
Aircraft icing avoidance and protection [PB82-108135] N82-17139
IDEAL FLUIDS
Analysis of an ideal-fluid flow past a finite-thickness wing A82-19813
IMAGE PROCESSING
Application of image processing techniques to fluid flow data analysis [NASA-TM-82760] N82-16049
IMAGE RESOLUTION
Airborne measurements with a sensitive high resolution 90 GHz radiometer A82-18940
IMAGING TECHNIQUES
Application of image processing techniques to fluid flow data analysis [NASA-TM-82760] N82-16049
IMPACT DAMAGE
Design Manual for impact damage tolerant aircraft structure [AGARD-AG-238] N82-17160
Description of projectile threats N82-17161
Analysis methods for predicting structural response to projectile impact N82-17162
Analysis methods for ballistic damage size and type N82-17163
Damage from High explosive (HE) projectiles N82-17164
Damage from engine debris projectiles N82-17165
Hydrodynamic ram damage N82-17166
Effects of cyclic loading on projectile impact damage N82-17167
Stiffness degradation of impact damaged structure N82-17168
Strength degradation of impact damaged structure N82-17169
Analysis of multiple load path panels containing impact damage N82-17170
IMPACT STRENGTH
Strength degradation of impact damaged structure N82-17169
Analysis of multiple load path panels containing impact damage N82-17170
IMPACT TOLERANCES
Design Manual for impact damage tolerant aircraft structure [AGARD-AG-238] N82-17160
Analysis methods for predicting structural response to projectile impact N82-17162
IMPURITIES
The use of Doppler spectroscopy to study the characteristics of the polydisperse characteristics of emulsion water and solid microimpurities in aviation fuels A82-22198
IN-FLIGHT MONITORING
The application of condition monitoring --- commercial helicopter in-service maintenance A82-20542
Quick learning diagnostics --- helicopter vibration analysis and component condition monitoring A82-20543
Minimum cost performance monitoring of turboshaft engines A82-20544
Development of a simple, self-contained flight test data acquisition system [NASA-CR-168438] N82-17478
INCOMPRESSIBLE FLOW
Unsteady lifting-line theory with applications [AIAA PAPER 82-0354] A82-19798
Effects of Reynolds number and turbulence level on axial cascade performance N82-17190
INDICATING INSTRUMENTS
System for providing an integrated display of instantaneous information relative to aircraft attitude, heading, altitude, and horizontal situation [NASA-CASE-FRC-11005-1] N82-16075
INDUSTRIAL SAFETY
Study of air compressor hazards in underground and surface mines [PB82-105164] N82-17597
INELASTIC STRESS
Research and development program for non-linear structural modeling with advanced time-temperature dependent constitutive relationships [NASA-CR-165533] N82-16080
INERTIAL NAVIGATION
Institute of Navigation, Annual Meeting, 36th, U.S. Naval Postgraduate School, Monterey, CA, June 23-26, 1980, Proceedings A82-21586
Calibrated and uncalibrated inertial navigation system performance in valid and jammed global positioning system environments A82-21587
INERTIAL REFERENCE SYSTEMS
The application of strapdown inertial technology to Attitude and Heading Reference System requirements --- for YAH-64 advanced attack helicopter A82-21590
INFINITE SPAN WINGS
The velocity potential for the harmonically oscillating, rectangular wing with semiinfinite span in nonlinear theory A82-19198
INFORMATION SYSTEMS
Systems approach to the design of wind shear avionics A82-21593

RUNWAY LIGHTS
Spectrally balanced chromatic landing approach lighting system
[NASA-CASE-ARC-10990-1] N82-16059
RUNWAYS
Requirements for instrument approaches to converging runways
[AD-A108075] N82-17144
Use of optimization to predict the effect of selected parameters on commuter aircraft performance
[NASA-CR-168439] N82-17151
Survey of 101 US airports for new multiple instrument approach concepts --- runways
[AD-A107812] N82-17229

S

SADDLE POINTS (GAME THEORY)
Analytical study of twin-jet shielding development of a 3-dimensional model
[NASA-CR-165106] N82-16805
SAFETY DEVICES
Test and evaluation of improved aircrew restraint systems
[AD-A107576] N82-16056
SAFETY FACTORS
Consequences of American airline deregulation - Legislative theory in a concrete example
A82-19947
SAFETY MANAGEMENT
Study of air compressor hazards in underground and surface mines
[PB82-105164] N82-17597
SATELLITE NAVIGATION SYSTEMS
A perspective on civil use of GPS
A82-21589
SCALE MODELS
Analysis of data from a wind tunnel investigation of a large-scale model of a highly maneuverable supersonic V/STOL fighter - STOL configuration
[AIAA PAPER 81-2620] A82-19207
Scale-model studies for the improvement of flow patterns of a low-speed tunnel
[NASA-CR-169413] N82-17228
Rotor model for the verification of computational methods
[ISD-275] N82-17638
SCANNERS
Current pressure measuring system in the transonic wind tunnel
[AD-A106272] N82-16096
SCENE ANALYSIS
Terrain model animation
[AD-A107911] N82-17887
SE-210 AIRCRAFT
Ground movement control and guidance - Cat. 3 operations experience in Air Inter
A82-20222
SEA WATER
Structure and variability of the Alboran Sea frontal system
A82-20447
US Naval fleet aircraft corrosion
N82-17350
Some observations on the corrosion of aircraft at the air force base in Bandirma, Turkey
N82-17353
SEALERS
US Naval fleet aircraft corrosion
N82-17350
SEALING
The experience of corrosion on French military aerodynes
N82-17355
SEARCHING
Special investigation report. Search and rescue procedures and arming of emergency locator transmitter: Aircraft accident near Michigan City, Indiana, 7 December, 1980
[PB81-249427] N82-16058
SECONDARY FLOW
End-wall boundary layer calculation methods
N82-17188
Correlation for secondary flows and clearance effects
N82-17189
SECONDARY RADAR
Analysis and tolerance study of an array antenna for a new generation of secondary radars
A82-19521
SEPARATED FLOW
Experimental studies of the Eppler 61 airfoil at low Reynolds numbers
[AIAA PAPER 82-0345] A82-19796
An experimental study of separated flow on a finite wing
[AIAA PAPER 81-1882] A82-20293
Visualization of flow separation and separated flows with the aid of hydrogen bubbles
A82-20803
Store separation from cavities at supersonic flight speeds
[AIAA PAPER 82-0372] A82-22096
SERVOMECHANISMS
The simulation study on a redundant flight control system
A82-22120
SET THEORY
Stage-state reliability analysis technique
N82-17104
SHAFTS (MACHINE ELEMENTS)
Application of the principle of reciprocity to flexible rotor balancing
[ASME PAPER 81-DET-49] A82-19311
SHALE OIL
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[DE82-001127] N82-17401
SHAPED CHARGES
Analysis methods for predicting structural response to projectile impact
N82-17162
SHARP LEADING EDGES
Measurements of a three-dimensional boundary layer on a sharp cone at Mach 3
[AIAA PAPER 82-0289] A82-22083
SHEAR FLOW
Rotating stall in blade rows operating in shear flow
A82-22209
SHEAR LAYERS
Effects of Reynolds number and turbulence level on axial cascade performance
N82-17190
SHELL STABILITY
Automated calculation of the stressed state of shell systems under asymmetrical mechanical and thermal loading
A82-19928
Studies on the stability of thin-walled shells with cutouts /Review/. I
A82-21629
SHIELDING
Analytical study of twin-jet shielding
[NASA-CR-165102] N82-16801
Analytical study of twin-jet shielding
[NASA-CR-165103] N82-16802
Analytical study of twin-jet shielding
[NASA-CR-165104] N82-16803
Analytical study of twin-jet shielding
[NASA-CR-165105] N82-16804
Analytical study of twin-jet shielding development of a 3-dimensional model
[NASA-CR-165106] N82-16805
Analytical study of twin-jet shielding two-dimensional model
[NASA-CR-165107] N82-16806
SHOCK WAVES
A split coefficient/locally monotonic scheme for multishocked supersonic flow
[AIAA PAPER 82-0287] A82-22082
A shock wave approach to the noise of supersonic propellers
[NASA-TM-82752] N82-16809
SHORT HAUL AIRCRAFT
Quiet Short-Haul Research Aircraft - The first 3 years of flight research
[AIAA PAPER 81-2625] A82-19209
SHORT TAKEOFF AIRCRAFT
Thrust-induced effects on low-speed aerodynamics of fighter aircraft
[AIAA PAPER 81-2612] A82-19203
Tactical STOL moment balance through innovative configuration technology
[AIAA PAPER 81-2615] A82-19204

Application of thrust vectoring for STOL [AIAA PAPER 81-2616] A82-19205
STOL capability impact on advanced tactical aircraft design [AIAA PAPER 81-2617] A82-19206
Quiet Short-Haul Research Aircraft - The first 3 years of flight research [AIAA PAPER 81-2625] A82-19209
Sea based support aircraft alternatives [AIAA PAPER 81-2649] A82-19217
Design features of a sea-based multipurpose V/STOL, STOVL, and STOL aircraft in a support role for the U.S. Navy [AIAA PAPER 81-2650] A82-19218
Performance flight test evaluation of the Ball-Bartoe JW-1 Jetwing STOL research aircraft A82-20762
Analytical control law for desirable aircraft lateral handling qualities A82-21941
Surveys of flow-field around empennage of the NAL STOL-research-aircraft model [NAL-TR-677] N82-17124
A velocity vector measuring system with 13 asymmetric wedge type yawmeters --- measuring flow distribution around the empennage of STOL models [NAL-TR-674] N82-17477

SHRAPNEL
Strength degradation of impact damaged structure N82-17169

SHROUDED TURBINES
Investigation of vibration of shrouded turbine blades [ASME PAPER 81-DET-129] A82-19343
A practical approach to systems mode analysis --- for disc-blade-shroud assemblies [ASME PAPER 81-DET-130] A82-19344

SIGNAL DETECTORS
Aircraft position measurement using laser beacon optics [AD-A107973] N82-16067

SIGNAL FADING
An analysis of antijam communication requirements in fading media A82-20695

SIGNAL MEASUREMENT
Experimental measurement of the low angle terrain scattering interference environment A82-20588

SIGNAL PROCESSING
Sanctuary radar --- with digital processor for Doppler filtering and pulse compression A82-18906
Microwave systems for radar guided missiles A82-18936
Comparison of various elevation angle estimation techniques A82-20589
Simulator data test instrumentation - Flight test challenge of the eighties A82-20768
Aircraft position measurement using laser beacon optics [AD-A107973] N82-16067

SIGNAL TRANSMISSION
Microwave communications to remotely piloted vehicles A82-18911
Land navigation with a low cost GPS receiver A82-20656

SIGNATURE ANALYSIS
On-site vibration measurement, dynamic tracking and balancing A82-20545

SILICON CARBIDES
Brittle materials design, high temperature gas turbine [AD-A106670] N82-16085

SILICON NITRIDES
Brittle materials design, high temperature gas turbine [AD-A106670] N82-16085

SILICONES
US Naval fleet aircraft corrosion N82-17350

SIMULATORS
Research through simulation --- simulators and research applications at Langley [NASA-FACTS-125] N82-16092
Development of the automated AFAPL engine simulator test for lubricant evaluation [AD-A106120] N82-16093

SIZE (DIMENSIONS)
Size reduction flight test airborne data systems A82-20766

SKIN (STRUCTURAL MEMBER)
Design of the composite spar-wingskin joint A82-20128

SLENDER CONES
Measurements of a three-dimensional boundary layer on a sharp cone at Mach 3 [AIAA PAPER 82-0289] A82-22083

SMALL PERTURBATION FLOW
Rotating stall in blade rows operating in shear flow A82-22209

SMOKE
Airborne lidar measurements of smoke plume distribution, vertical transmission, and particle size A82-21386

SOLID STATE DEVICES
L-band power generation in the General Electric solid-state radar A82-18914

SOLIDIFICATION
Development of in-can melting process and equipment, 1979 and 1980 [DE82-001050] N82-16834

SOLVENT REFINED COAL
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes [DE82-001127] N82-17401

SOOT
The sooting tendency of fuels containing polycyclic aromatics in a research combustor [AIAA PAPER 82-0299] A82-19791

SOUND PRESSURE
Pressure dependence of jet noise and silencing of blow-offs A82-20266

SOUND PROPAGATION
Ultrasonic method for flow field measurement in wind tunnel tests A82-20054
A comprehensive flight test flyover noise program A82-20765

SPACE ENVIRONMENT SIMULATION
The Global Positioning System Evaluator --- facility for testing in simulated wide range environments A82-21588

SPACE EXPLORATION
Fiscal year 1981 scientific and technical reports, articles, papers, and presentations [NASA-TM-82445] N82-16927

SPACE SHUTTLE ORBITERS
Analytical prediction of aerospace vehicle vibration environments [ASME PAPER 81-DET-29] A82-19305

SPACE SHUTTLES
Research and technology annual report, 1981 [NASA-TM-81333] N82-17081

SPACE TRANSPORTATION SYSTEM
Fiscal year 1981 scientific and technical reports, articles, papers, and presentations [NASA-TM-82445] N82-16927

SPACECRAFT STRUCTURES
Calculation of sensitivity derivatives in thermal problems by finite differences A82-21391

SPECIFICATIONS
Hierarchical specification of the SIFT fault tolerant flight control system N82-17106

SPECTROSCOPIC ANALYSIS
The use of Doppler spectroscopy to study the characteristics of the polydisperse characteristics of emulsion water and solid microimpurities in aviation fuels A82-22198

SPIN DYNAMICS
An analytical technique for the analysis of airplane spin entry and recovery [AIAA PAPER 82-0243] A82-19786

B

BABER, B. B.
Development of the automated AFAPL engine simulator test for lubricant evaluation
[AD-A106128] N82-16093

BACKMANN, G.
Future requirements for helicopter propulsion systems
N82-17225

BAILEY, D. B.
Studies of modern technology airships for maritime patrol applications
A82-20554

BALKE, H.-J.
Properties of the new flight and tactics simulators
[DGLR PAPER 81-106] A82-19265
Procurement of the new flight and tactics simulators - Experience, problems, meaning
[DGLR PAPER 81-095] A82-19266

BANKS, D. W.
Thrust-induced effects on low-speed aerodynamics of fighter aircraft
[AIAA PAPER 81-2612] A82-19203

BARADAT, J.
The effects on simulators of advances in aircraft technology
A82-20533

BARNA, P. S.
Scale-model studies for the improvement of flow patterns of a low-speed tunnel
[NASA-CR-169413] N82-17228

BARVINSKII, A. P.
Aircraft electrical equipment - Design and operation
A82-18998

BATES, R. W.
A study of potentially low cost millimetre-wave radiometric sensors
A82-18942

BAVUSO, S. J.
Methodology for measurement of fault latency in a digital avionic miniprocessor
N82-17105

BECKMANN, J.
Measurement of the influence of flow distortions on the blade vibration amplitude in an air turbine
[ASME PAPER 81-DET-135] A82-19348

BEDROSSIAN, H.
Application of structural optimization technique to reduce the external vibrations of a gas-turbine engine

ICING TUNNEL TEST OF A GLYCOL-EXUDING POROUS LEADING EDGE ICE PROTECTION SYSTEM ON A GENERAL AVIATION AIRFOIL Final Report
David L. Kohlman, William G. Schweikhard, and Alan E. Albright
Sep. 1981 37 p refs
(Grant NAG3-71)
(NASA-CR-165444; KU-FRL-464-1) Avail: NTIS
HC A03/MF A01 CSCL 01C

Test results show that the system is very effective in preventing ice accretion (anti-ice mode) or removing ice from an airfoil. Minimum glycol flow rates required for antiicing are a function of velocity, liquid water content in the air, ambient temperature, and droplet size. Large ice caps were removed in only a few minutes using anti-ice flow rates, with the shed time being a function of the type of ice, size of the ice cap, angle of attack, and glycol flow rate. Wake surveys measurements show that no significant drag penalty is associated with the installation or operation of the system tested. T.M.

A82-11317 # **Development of aircraft production engineering discipline at IIT, Bombay.** N. K. Naik (Indian Institute of Technology, Bombay, India). *Aeronautical Society of India, Journal*, vol. 31, Feb.-Nov. 1979, p. 119-125.

The aircraft production engineering courses offered at the Indian Institute of Technology, in Bombay, are discussed. To demonstrate the value of the courses, the fundamentals of aircraft production are outlined, the discussion being confined to airframe production. The loft-template method is described, and the principal loft-template scheme used in aircraft production is shown. Also described are the theory and laboratory courses offered at the institute. C.R.

AERONAUTICAL ENGINEERING

A Continuing Bibliography (Suppl. 149)

JUNE 1982

IAA ENTRIES

A82-22398 † Analysis and optimization of control systems in piloted flight vehicles (Analiz i optimizatsiia sistem upravleniia pilotiruemykh letatel'nykh apparatov). G. I. Ryl'skii. Moscow, Izdatel'stvo Mashinostroenie, 1981. 200 p. 156 refs. In Russian.

An analysis is given of the activity of a human operator in the control systems of piloted flight vehicles and of the possibility of describing this activity mathematically. A classification is suggested, and an analysis made, of recent mathematical models describing human activity in these systems. Attention is given to the advantages of the models that use queuing theory, and these models are used in elaborating techniques for determining characteristics of the operator's work. C.R.

A82-22407 † Utilization of radio equipment at airports and on airways (Ekspluatatsiia radiooborudovaniia aerodromov i trass). A. A. Kuznetsov and V. I. Dubrovskii. Moscow, Izdatel'stvo Transport, 1981. 224 p. 26 refs. In Russian.

The organization of navigation aids and air traffic control in civil aviation is briefly considered. Problems of technical and economic planning, the organization of support and maintenance, and the collection and processing of reliability data pertaining to air navigation and ATC equipment are also considered. Specific attention is given to the utilization characteristics of radio navigation and ATC systems; ATC radar stations; automated ATC; display equipment; and methods and models for the utilization of radio navigation and ATC systems. B.J.

A82-22880 Complete guide to Rutan homebuilt aircraft. D. Downie and J. Downie. Blue Ridge Summit, PA, Tab Books, Inc., 1981. 288 p. $8.95.

The development history of a group of home-built sport aircraft characterized by canard configurations and non-metallic construction is presented, from the time that the designer, Burt Rutan, who won an AIAA award for his thesis on roll-yaw coupling started the project to the flight testing of the four-passenger, push/pull propeller Defiant aircraft. Incorporating the canard in order to exploit both its inherent stall-limiting function and its direct-lift generation at low incidence during short takeoffs and landings, the two designs featured are (1) the plywood-structure VariViggen, and (2) the more highly developed VariEze/Long-EZ, whose structure is of fiberglass cloth-reinforced self-curing epoxy layups over pre-shaped styrofoam. Additional material on aircraft construction and performance at the hands of the designer and dozens of his hobbyist-clients is also presented. O.C.

A82-22881 Computer-generated images for simulators - The cost of technology. G. C. Larson. *Air Force Magazine*, vol. 65, Feb. 1982, p. 54-59.

The effectiveness, capabilities, and prospects for computer-controlled flight simulators suitable for combat flight training are examined. Current devices offer a wraparound imagery, multiple crewmember interface, and separate cockpit coordinated displays suitable for developing teamwork among pilots of different aircraft. The simulators are equipped with realistic cockpits, an instructor's station with full control and recording equipment, a data base with simulator dynamics and ability to translate actions into real-time responses, and a visual system which displays a scene that could be expected in the real world. Mechanical limitations are defined by the cost of memory and processing speed necessary for edge generation, the formation of geometric shapes and solids closely resembling real world objects, and texturing has shown promise for defining recognizable areas by rectangular areas which overlap in a fashion acceptable to a human field of vision. M.S.K.

A82-22896 # Lineup of the IM-series aircraft-derivative gas turbines. K. Takeo (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan). *IHI Engineering Review*, vol. 14, Oct. 1981, p. 36-42. 5 refs.

The development of the IM-series of aircraft derivative gas turbines is reviewed. The discussion begins with the IM1500 GL engine, having an output at turbine coupling of 11,100 kW and a thermal efficiency of 26.8%, first used as an industrial gas generator in 1968. Principal characteristics of the IM2000 and IM2500 are then discussed: the output and thermal efficiency of these two models are given as 12,800 kW and 33.5% and 19,300 kW and 35.1%, respectively. Fundamental specifications of the power turbines are described, and the flowpath design is presented. The construction and mechanical design of the engins are described, and results of creep-rupture, high temperature fatigue, and vibratory stress tests are given. Finally, the IM5000 power turbine, with an output of 38,000 kW and an efficiency of 38.4% is described. It is also shown how heat in the high-temperature exhaust gases from the turbines can be used in waste heat recovery systems to improve the total plant efficiency. J.F.

A82-22898 # History of the sweptback wing (Geschichte des Pfeilflügels). H. Ludwieg (Aerodynamische Versuchsanstalt, Institut für experimentelle Strömungsmechanik, Göttingen, West Germany). *Deutsche Gesellschaft für Luft- und Raumfahrt, Jahrestagung, Aachen, West Germany, May 11-14, 1981, Paper 81-070.* 15 p. 10 refs. In German.

The history of sweptback wings which make use of the sweepback to alter the effective Mach number is reviewed. Principles of the sweptback wing and its effects are discussed for subsonic flight with high Mach numbers, supersonic flight with a subsonic leading edge, and supersonic flight with a supersonic leading edge. The historical development is traced from the first sweptback wing model in 1939 for the Gottinger high speed wind tunnel to various fighter aircraft including the Messerschmitt 262 and Heinkel designs. Results of wind tunnel tests for various angles of sweepback are presented. D.L.G.

A82-22902 The use of dynamic mock-ups in the design of advanced systems. M. L. Gravely (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) and L. Hitchcock (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). In: Human Factors Society, Annual Meeting, 24th, Los Angeles, CA, October 13-17, 1980, Proceedings. Santa Monica, CA, Human Factors Society, Inc., 1980, p. 5-6.

The advantages of using dynamic mock-ups in advanced system design are discussed in terms of the USAF's Digital Avionic Information System (DAIS) Program and the Navy's Advanced Integrated Display System (AIDS) Cockpit Development Program. Experienced pilots are employed to judge the acceptability of slide projector displays for radar, low-light level television, and alphanumeric and vector graphic formats. Cost effectiveness is achieved by lowering software costs, minimizing time in constructing the mock-up, and high reliability-low maintenance features. The cockpit layout is set up once the required tasks and the number of multifunction

Aerospace Electrical Div., Lima, OH). In: Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p.1-15.

Design considerations in the development of the DC-Link VSCF electrical power systems for aircraft are presented, along with component descriptions, functional details, applications to the AV8-B and F-5G, and comparisons to alternate methods of power generation. The DC-Link system is compared with constant speed drive and cycloconverter energy systems, and the major components of the DC-Link system are shown to be a generator module, power electronics module, and the generator control module, which as a system yield a constant frequency output and employ transistorized switching. Specific descriptions are provided of the power transistors, the inverter power pole, the commutating diodes, and the base drive circuit. Operational characteristics such as the inverter waveform, neutral forming transformer and power stage sensing are considered, and functions of the generator control unit and inverter drive logic module are outlined. M.S.K.

A82-24378 Cost of ownership advantages with a shared oil system. R. C. VanNocker and W. A. Carmine (General Electric Co., Binghamton, NY). In: Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p.17-21.

The benefits and system features of coupling the aircraft gearbox oil to the generator cooling system are outlined. It is noted that in a constant speed drive system, weight, maintainability, and life cycle costs are aided by avoiding redundant oil pumping facilities. The shared system is favored when generator functions won't contaminate the oil, pose no risk to the gearbox, and do not command the use of excessive amounts of oil. A dry cavity concept is described, which features heat exchangers completely isolated from any generator electrical components, and the use of the shared system on the F/A-18 is mentioned. The addition of the shared-oil module alters the maintenance concept from on-condition to a scheduled maintenance procedure, and an ultimate repair and maintenance cost figure of $2.70 per flight hr is derived. M.S.K.

A82-24379 High speed VSCF generator design consideration. T. L. Ho (Westinghouse Electric Corp., Aerospace Electrical Div., Lima, OH). In: Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 23-33.

The employment of computer aided design (CAD) for VSCF generator design is examined, specifically with regard to thermal, stress, and dynamic analyses. Thermal analysis is accomplished through an iteration of a series of design modifications, and examples are presented for the design of inverter semiconductor stacks, a diode rectifier assembly, and a power pole assembly. Finite element programs are implemented in a structural analysis, focusing attention on weight reduction and stress concentration at specified speeds, and procedures are outlined for applications to an inverter cover plate and to a high speed rotor. Dynamic study comprises model analysis by a finite element method and a critical speed analysis of the rotating system by means of turbomachine dynamics programs, serving to define the structural stability of the system. M.S.K.

A82-24380 Advanced generating system technology. R. J. Kennett (Lucas Aerospace, Ltd., Electrical Div., Hemel Hempstead, Herts., England). In: Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 35-41. Research supported by the Ministry of Defence (Procurement Executive) and Department of Industry.

A design approach to the achievement of a maximum specific output of an aircraft 400 Hz ac 2-pole generator with operation at 24,000 rpm is presented. Locating the field assembly inside a nonmagnetic shaft eliminated mechanical conflicts and allowed an inherently stiff rotor, permitted flooding the rectifiers with cooling oil to reduce temperature gradients, and porting to the stator to minimize drag losses and avoid insulation erosion. The rectifiers were moved toward the shaft axis, and interconnection with the main exciter was arranged to neutralize centrifugal forces on the rectifier connection. The rotor shaft is used to provide maximum support for the stressed elements along the length of the alternator, which has a single coil. Weight reduction is also provided over four-pole machines, and bearing life is protected by a low rotating mass and elimination of mechanical unbalance. Operation and maintenance are reviewed. M.S.K.

A82-24381 The effect of critical design parameters on the selection of a VSCF system. D. S. Yorksie and W. E. Hyvarinen (Westinghouse Electric Corp., Aerospace Electrical Div., Lima, OH). In: Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 43-50.

A decision model of the critical design criteria for applications of either cycloconverter or DC-Link variable speed, constant frequency (VSCF) electric power generators onboard aircraft are examined. Power switching and controlling techniques and components are described for each type of generator, noting the advent of advanced high-power switching transistors. Critical parameters of choice include the system rating, cooling method and temperature, efficiency, weight, location, and gearbox speed and range. Each parameter is explored for effect in different applications, and it is concluded that rating, cooling temperature, efficiency, and weight are the most critical parameters. A fifth element is added to the four most critical criteria, and comprises system-specific features which customize the decision model to the application under consideration. M.S.K.

A82-24382 Evolution and development of high voltage /270 volt/ dc aircraft electric systems in the United States. J. D. Segrest (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) and W. W. Cloud (Lockheed-California Co., Burbank, CA). In: Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 51-63. 10 refs.

The system concept of high voltage dc power systems for aircraft applications is reviewed, with regard to the state-of-the-art in the hardware available. The history of dc system use is outlined, noting the continually increasing demand of higher voltage levels. Mention is also made of the inherent unsatisfactory lifetime levels of current constant speed 400 Hz power devices with respect to future aircraft. Cycloconverter and DC-Link power generating systems are subject to complex designs and display a poor power factor, wave form distortion, and EM incompatibility. Brushless dc motors are available for engine mounting, and provide 270 V dc, which offers high reliability, high efficiency, light weight, power continuity, fuel economy, and personnel safety. Existing systems and advanced systems are outlined, with operational performance and requirements, including the need to develop solid-state load controllers for over 50 amps power load. M.S.K.

A82-24383 Packaging the VSCF system for an aircraft engine environment. D. D. Pollard and G. E. Krajci (Westinghouse Electric Corp., Aerospace Electrical Div., Lima, OH). In: Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981. Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p. 65-76.

The integration of microprocessor modules, high power semiconductor arrays, and a high-speed generator to form a compact, low-weight variable speed constant frequency (VSCF) power system is described. With specific consideration of military systems, envelope concerns are defined as the allowable space and shape, power and logic electrical interfaces, coolant/lubricant lines and interfaces, and maintainability. Military aircraft are noted to require dense packaging, have common disconnect mechanisms, and allow removal of the entire system at once. Sensitive components are sealed off from the environment and vibrations, and thermal control is provided by air oil and fuel-oil heat exchangers. Operation without oil flow is feasible for short periods of time due to the thermal inertia, and installations in the F-5G and AV-8B aircraft are detailed. M.S.K.

A82-24384 **Aircraft electric system development and test facilities.** D. Cousins (Sundstrand Corp., Rockford, IL). In: Aircraft electrical power systems; Proceedings of the Aerospace Congress and Exposition, Anaheim, CA, October 5-8, 1981.
Warrendale, PA, Society of Automotive Engineers, Inc., 1981, p.77-86.

Specialized capabilities, requirements, and design considerations for a facility to construct electric power systems for aircraft are described. A test area is provided for development and qualification testing of aircraft generating systems, along with a multistand complex for accelerated life testing, and a facility for electronic and electric products. Individual test cells are required for examining the performance of test generators during specified voltage drops and impedance. Further provision is made for testing prime movers, gearboxes, generator feeders, control consoles, load systems, and main and auxiliary load controls. Instrumentation is dedicated to both test stand consoles and from multichannel data acquisition system recorders and displays. Finally, electromagnetic compatibility testing is accomplished by examining radiated and conducted EM interference and by exposure to EM pulses. M.S.K.

A82-24385 **Wind and temperature database for flight planning.** H. C. True and D. E. Winer (FAA, Office of Environment and Energy, Washington, DC). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811068.* 8 p. 17 refs.

The importance of timely and accurate wind and temperature data to flight planning and aircraft fuel conservation is pointed out. Recent advances in meteorological data measurement make it possible to obtain the required information. Attention is given to aspects of flight planning, the existing observation network, an atmospheric model, fuel considerations, wind and temperature observation technology, the potential of satellite based wind observation systems, and the dissemination of observations to aviation flight planners. It is found to be technically and economically feasible to create a wind and temperature database for flight planning based on the Prototype Regional Observation and Forecasting System 'profiler'. G.R.

A82-24386 * **Airline flight planning - The weather connection.** R. Steinberg (NASA, Lewis Research Center, Cleveland, OH). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811067.* 12 p.

The history of airline flight planning is briefly reviewed. Over half a century ago, when scheduled airline services began, weather data were almost nonexistent. By the early 1950's a reliable synoptic network provided upper air reports. The next 15 years saw a rapid growth in commercial aviation, and airlines introduced computer techniques to flight planning. The 1970's saw the development of weather satellites. The current state of flight planning activities is analyzed. It is found that accurate flight planning will require meteorological information on a finer scale than can be provided by a synoptic forecast. Opportunities for a new approach are examined, giving attention to the available options, a mesoscale numerical weather prediction model, limited area fine mesh models, man-computer interactive display systems, the use of interactive techniques with the present upper air data base, and the implementation of interactive techniques. G.R.

A82-24387 * **Integration of energy management concepts into the flight deck.** S. A. Morello (NASA, Washington, DC). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811066.* 10 p. 7 refs.

The rapid rise of fuel costs has become a major concern of the commercial aviation industry, and it has become mandatory to seek means by which to conserve fuel. A research program was initiated in 1979 to investigate the integration of fuel-conservative energy/flight management computations and information into today's and tomorrow's flight deck. One completed effort within this program has been the development and flight testing of a fuel-efficient, time-based metering descent algorithm in a research cockpit environment. Research flights have demonstrated that time guidance and control in the cockpit was acceptable to both pilots and ATC controllers. Proper descent planning and energy management can save fuel for the individual aircraft as well as the fleet by helping to maintain a regularized flow into the terminal area. G.R.

A82-24388 **Application of damage tolerance technology to type certification.** T. Swift (FAA, Washington, DC). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811062.* 20 p. 29 refs.

An attempt is made to clarify some of the questions related to the FAA philosophy which are currently being raised by manufacturers in attempting to comply with recently amended regulations for aircraft structures. A description is presented of opinions related to good damage tolerance design practice, and fracture analysis methodology. In general, an evaluation of the structure, under typical load and environmental spectra must show that catastrophic failure due to fatigue, corrosion, or accidental damage will be avoided throughout the operational life of the aircraft. Attention is given to a damage tolerance evaluation, aircraft utilization, the selection of critical elements, aspects of stress spectra development, environmental effects, and fracture toughness data. G.R.

A82-24389 **Certification of civil composite aircraft structure.** J. R. Soderquist (FAA, Office of Airworthiness, Washington, DC). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811061.* 10 p. 19 refs.

The certification of composite civil aircraft structures is shown to require a common, allowable material property data base in which the chemical characterization of the resin through the use of high pressure liquid chromatography and Fourier transform infrared spectroscopy is employed. In addition, improved damage-tolerance techniques and tougher material systems must be developed to allow higher design strain levels. Significant benefits can be derived from the continued operation of a composite structure in the post-buckled regime, provided that investigations continue into environmental effects, combined loading states, curvature, variations in skin thickness and impact damage effects. It is recommended that a portable nondestructive inspection technique be devised for use in field repairs. O.C.

A82-24392 **Design technology for improved performance retention in turbofan engines.** D. L. Seiwert (General Electric Co., Fairfield, CT). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811055.* 10 p.

General causes of performance loss in large turbofan engines after long time field use are examined, and programs whose objectives are to maximize engine performance retention are described. Advanced design concepts to produce significant improvement in performance retention of commercial turbofan engines are presented, and factors which cause clearance changes between rotating and static components are discussed. Engine generated and externally applied loads, and operating technique effects are addressed, and evaluation techniques for design verification including laser optics are described. Performance retention items include a substantially improved high pressure turbine shroud material, which reduces distortion and thereby avoids rubs. D.L.G.

A82-24393 **RB 211 powerplant deterioration - Review of current situation and lessons learned.** A. G. Collins (Rolls-Royce, Ltd., London, England). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811053.* 6 p.

The factors which cause aircraft engines to lose performance in a service environment are briefly examined. It is pointed out that in the case of the RB 211 engine many of the fundamental causes of deterioration are avoided or minimized in connection with basic engine design features. The -22B was the first of the RB 211 family of engines to enter service. Major causes of RB 211-22B deterioration were related to the accumulation of dirt on compressors, the distortion of HP NGV support rings, increased leakages in powerplant area, and erosion of turbine tip sealing segments. By suitable modifications of the engine design it was possible to eliminate the observed causes of engine deterioration in the RB211-524. Problems concerning engine deterioration observed in connection with RB 211-524 operation will be corrected in the RB 211-535 by the introduction of appropriate improvements. G.R.

A progress report on the European Transonic Wind Tunnel Project
[ONERA, TP NO. 1981-121] A82-19737

CYCLIC LOADS
A crack-closure model for predicting fatigue crack growth under aircraft spectrum loading
A82-20509
Process monitor helps make jet engines reliable
A82-21897
Effects of cyclic loading on projectile impact damage
N82-17167
Rotor model for the verification of computational methods
[ISD-275] N82-17638
Loading cycles and material data for the layout of a wind turbine of special hub concept
[ISD-273] N82-17643

D

DAMAGE
Damage tolerant design for cold-section turbine engine disks
[AD-A107863] N82-17176
Lubrication breakdown between gear teeth
N82-17213

DAMAGE ASSESSMENT
Analysis methods for ballistic damage size and type
N82-17163
Damage from High explosive (HE) projectiles
N82-17164
Damage from engine debris projectiles
N82-17165
Forecasting corrosion damage and maintenance costs for large aircraft
N82-17357

DAMPERS (VALVES)
Part span damper loss prediction for transonic axial fan rotors
N82-17192

DAMPING
Subsonic and transonic roll damping measurements on Basic Finner --- finned missile calibration model
A82-19958

DATA ACQUISITION
Development of a simple, self-contained flight test data acquisition system
A82-20756
Data systems organization - A change for the better --- flight test data acquisition
A82-20767
Color graphics based real-time telemetry processing system
A82-20771
Flow visualization using a computerized data acquisition system
A82-20792
Programs for the transonic wind tunnel data processing installation. Part 9: Pressure measurements updated
[AD-A106271] N82-16095

A versatile data acquisition system for a low speed wind tunnel
[AD-A106269] N82-16097
Development of a simple, self-contained flight test data acquisition system
[NASA-CR-168438] N82-17478

DATA BASES
Data base generation for digital external view systems
[DGLR PAPER 81-101] A82-19270
Aeronautical Information Data Subsystem (AIDS): A ground-based component of air navigation services systems
N82-17150

DATA LINKS
Microwave communications to remotely piloted vehicles
A82-18911
Laser communications via an atmospheric link
A82-20615
Relay-augmented data links in an interference environment
A82-20684

DATA MANAGEMENT
The Boeing Flight Test Data System 1980
A82-20769
Instrumentation remote 'mini' ground station
A82-20770

DATA PROCESSING
Instrumentation remote 'mini' ground station
A82-20770
Color graphics based real-time telemetry processing system
A82-20771
A versatile data acquisition system for a low speed wind tunnel
[AD-A106269] N82-16097
Tactical Airborne Distributed Computing and Networks
[AGARD-CP-303] N82-17086
Distributed data processing: What is it?
N82-17087

DATA REDUCTION
Simulator data test instrumentation - Flight test challenge of the eighties
A82-20768

DATA SYSTEMS
Automation in flight simulation of data handling and validation testing
A82-20532
Data systems organization - A change for the better --- flight test data acquisition
A82-20767
The Boeing Flight Test Data System 1980
A82-20769
Instrumentation remote 'mini' ground station
A82-20770

DATA TRANSMISSION
The significance of electronics for air traffic control at the present time and in the future
A82-19649

DC 10 AIRCRAFT
Investigation and evaluation of a computer program to minimize three-dimensional flight time tracks
[NASA-CR-168419] N82-17879

DEICERS
Ice phobics blade tracking and comparison of vibration analysis techniques
[AD-A108121] N82-16074

DELTA WINGS
Use of high conical flow theory for the determination of the pressure distribution on the wave rider and its agreement with experimental results for supersonic flow
A82-19197
Aerodynamic characteristics of waveriders at subsonic flight speeds
A82-19810
Alleviation of the subsonic pitch-up of delta wings
[AIAA PAPER 82-0129] A82-22052
Experimental study of delta wing leading-edge devices for drag reduction at high lift --- conducted in Langley 7- by 10-foot high speed tunnel
N82-17125
Finite difference computation of the conical flow field over a delta wing
[VKI-TN-140] N82-17135

DEMAND (ECONOMICS)
Energy environment study
[NASA-CR-168458] N82-17654

DEPOSITION
Deposit formation in liquid fuels. II - The effect of selected compounds on the storage stability of Jet A turbine fuel
A82-22240

DESIGN ANALYSIS
Design criteria for a miss distance radar
A82-18904
Airborne measurements with a sensitive high resolution 90 GHz radiometer
A82-18940
A study of potentially low cost millimetre-wave radiometric sensors
A82-18942
Boundary layer transition and separation on a compressor rotor airfoil
A82-20299
Pre-design study for a modern four-bladed rotor for the Rotor System Research Aircraft (RSRA) --- integrating the YAH-64 main rotor
[NASA-CR-166154] N82-16043
Study of controlled diffusion stator blading. 1. Aerodynamic and mechanical design report
[NASA-CR-165500] N82-16081
Brittle materials design, high temperature gas turbine
[AD-A106670] N82-16085
Deviation/turning angle correlations
N82-17193
Single stage transonic compressor and equivalent plane cascade
N82-17196
Results of calculations
N82-17198

DETECTION
Test and evaluation of UV fiber optics for application for aircraft fire detector systems
[AD-A106129] N82-16850

DICKE RADIOMETERS
A study of potentially low cost millimetre-wave radiometric sensors
A82-18942
Radiometric measurements at 80 GHz
A82-18943

DIELECTRICS
Leaky wave antenna using an inverted strip dielectric waveguide --- for aircraft application
A82-19552

DIFFERENTIAL PRESSURE
A program to evaluate a control system based on feedback of aerodynamic pressure differentials
[NASA-CR-163466] N82-16089

DIFFUSION
Study of controlled diffusion stator blading. 1. Aerodynamic and mechanical design report
[NASA-CR-165500] N82-16081
Survey on diffusion factors and profile losses
N82-17186
Evaluation of profile loss predictions based on diffusion factors
N82-17200

DIGITAL COMPUTERS
Simulation of advanced cockpits
A82-19259
Properties of the new flight and tactics simulators
[DGLR PAPER 81-106] A82-19265

DIGITAL RADAR SYSTEMS
Tactical Radar Threat Generator system
A82-18903
Sanctuary radar --- with digital processor for Doppler filtering and pulse compression
A82-18906
Simulation of modern radar installations in full-mission flight and tactics simulators
[DGLR PAPER 81-103] A82-19272

DIGITAL SIMULATION
Real-Time Simulation Computation System --- for digital flight simulation of research aircraft
A82-19260
Requirements regarding digital external view systems for full mission flight and tactics simulators
[DGLR PAPER 81-100] A82-19267
The effects on simulators of advances in aircraft technology
A82-20533

- Digital Avionics Information System (DAIS): Development and demonstration [AD-A107906] N82-16079
- Aeronautical Information Data Subsystem (AIDS): A ground-based component of air navigation services systems N82-17150
- Digital Avionics Information System (DAIS) documentation [AD-A108000] N82-17172

INLET FLOW
- Thrust modulation methods for a subsonic V/STOL aircraft [AIAA PAPER 81-2633] A82-19213

INLET NOZZLES
- Low speed testing of the inlets designed for a tandem-fan V/STOL nacelle [AIAA PAPER 81-2627] A82-19210

INSPECTION
- The ultrasonic inspection of C.F.C. --- carbon fiber sine wave spars [BDE-0465] N82-17513

INSTRUMENT APPROACH
- Requirements for instrument approaches to converging runways [AD-A108075] N82-17144
- Survey of 101 US airports for new multiple instrument approach concepts --- runways [AD-A107812] N82-17229

INSTRUMENT ERRORS
- Analysis of flight test measurements in ground effect A82-20763

INSTRUMENT LANDING SYSTEMS
- Ground movement control and guidance - Cat. 3 operations experience in Air Inter A82-20222
- Requirements for instrument approaches to converging runways [AD-A108075] N82-17144
- Investigation of Wilcox model 585B very high frequency omnidirectional radio range (VOR) system, part 3 [AD-A107855] N82-17149

INTAKE SYSTEMS
- Airframe effects on top-mounted inlet systems for VSTOL fighter aircraft [AIAA PAPER 81-2631] A82-19212
- Helicopter Propulsion Systems [AGARD-CP-302] N82-17203
- Intake design with particular reference to ice protection and particle separators N82-17218

INTERACTIVE CONTROL
- Data base generation for digital external view systems [DGLR PAPER 81-101] A82-19270
- The future of integrated CAD/CAM systems - The Boeing perspective A82-20278

INTERFACES
- Functional versus communication structures in modern avionic systems N82-17092
- Engine/drive/airframe compatibility: A way of life N82-17220

INTERFERENCE
- Ground reflection effects in aircraft noise measurements A82-19970

INTERNATIONAL LAW
- Offshore uses of the airship A82-20553

INTERNATIONAL TRADE
- Energy environment study [NASA-CR-168458] N82-17654

INTERPROCESSOR COMMUNICATION
- Functional versus communication structures in modern avionic systems N82-17092
- A reconfigurable change network for distributed process control N82-17108
- Next generation military aircraft will require hierarchical/multilevel information transfer systems --- packet switching N82-17114
- SIFT: An ultra-reliable avionic computing system N82-17115

INVISCID FLOW
- Technical evaluation report of the AGARD Fluid Dynamics Panel Symposium on computation of viscous-inviscid interactions [ONERA, TP NO. 1981-116] A82-19733

J

JAMMING
- Relay-augmented data links in an interference environment A82-20684
- An analysis of antijam communication requirements in fading media A82-20695
- Calibrated and uncalibrated inertial navigation system performance in valid and jammed global positioning system environments A82-21587

JET AIRCRAFT
- Experience with flight simulators - Training effectiveness-future developments [DGLR PAPER 81-110] A82-19263
- JP-8 fuel conversion evaluation A82-20755
- Design, development and flight testing of a jet powered sailplane A82-20761
- Symposium on commercial-aviation energy-conservation strategies [DE81-028406] N82-16057
- Multiple pure tone elimination strut assembly --- air breathing engines [NASA-CASE-FRC-11062-1] N82-16800
- Forecasting corrosion damage and maintenance costs for large aircraft N82-17357
- Corrosion control measures for military aircraft: Present UK requirements and future developments N82-17358
- Corrosion prevention methods developed from direct experience with aerospace structures N82-17359

JET AIRCRAFT NOISE
- Can low-speed jet noise be predicted A82-22222
- Comparison of acoustic data from a 102 mm conic nozzle as measured in the RAE 24-foot wind tunnel and the NASA Ames 40- by 80-foot wind tunnel [NASA-TM-81343] N82-16083
- Analytical study of twin-jet shielding [NASA-CR-165102] N82-16801
- Analytical study of twin-jet shielding [NASA-CR-165103] N82-16802
- Analytical study of twin-jet shielding [NASA-CR-165104] N82-16803
- Analytical study of twin-jet shielding [NASA-CR-165105] N82-16804
- Analytical study of twin-jet shielding development of a 3-dimensional model [NASA-CR-165106] N82-16805
- Analytical study of twin-jet shielding two-dimensional model [NASA-CR-165107] N82-16806

JET ENGINE FUELS
- The sooting tendency of fuels containing polycyclic aromatics in a research combustor [AIAA PAPER 82-0299] A82-19791
- Deposit formation in liquid fuels. II - The effect of selected compounds on the storage stability of Jet A turbine fuel A82-22240
- Deposit formation in liquid fuels. I - Effect of coal-derived Lewis bases on storage stability of Jet A turbine fuel A82-22241
- Energy environment study [NASA-CR-168458] N82-17654

JET ENGINES
- Process monitor helps make jet engines reliable A82-21897
- Prediction of sound radiation from different practical jet engine inlets [NASA-CR-165120] N82-16810
- CF6 jet engine performance improvement: High pressure turbine roundness [NASA-CR-165555] N82-17174

JET EXHAUST
  Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts
  [AIAA PAPER 82-0255] A82-22077
JET FLOW
  Pressure dependence of jet noise and silencing of blow-offs
  A82-20266
  Dilution jet behavior in the turn section of a reverse flow combustor
  [AIAA PAPER 82-0192] A82-20291
  Analytical study of twin-jet shielding
  [NASA-CR-165102] N82-16801
  Analytical study of twin-jet shielding
  [NASA-CR-165103] N82-16802
  Analytical study of twin-jet shielding
  [NASA-CR-165104] N82-16803
  Analytical study of twin-jet shielding
  [NASA-CR-165105] N82-16804
  Analytical study of twin-jet shielding development of a 3-dimensional model
  [NASA-CR-165106] N82-16805
  Analytical study of twin-jet shielding two-dimensional model
  [NASA-CR-165107] N82-16806
JET IMPINGEMENT
  Impingement cooling of concave surfaces of turbine airfoils
  A82-18894
  Experimental investigation of a jet inclined to a subsonic crossflow
  [AIAA PAPER 81-2610] A82-19202
JOINTS (JUNCTIONS)
  Design of the composite spar-wingskin joint
  A82-20128
  Improving composite bolted joint efficiency by laminate tailoring
  A82-20982
JOURNAL BEARINGS
  Optimum journal bearing parameters for minimum rotor unbalance response in synchronous whirl
  [ASME PAPER 81-DET-55] A82-19314
JP-8 JET FUEL
  JP-8 fuel conversion evaluation
  A82-20755

K

KEVLAR (TRADEMARK)
  Skyship 500 - The development of a modern production airship
  A82-20559

L

LAGRANGE MULTIPLIERS
  Power system design optimization using Lagrange multiplier techniques
  A82-20743
LAMINAR BOUNDARY LAYER
  Visualization of laminar separation by oil film method
  A82-20811
LAMINATES
  On the track of practical forward-swept wings
  A82-19071
  Design of the composite spar-wingskin joint
  A82-20128
  Bolted field repair of graphite/epoxy wing skin laminates
  A82-20981
  Improving composite bolted joint efficiency by laminate tailoring
  A82-20982
  Fabrication of boron/aluminum fan blades for SCR engines
  [NASA-CR-165294] N82-16176
  Transparent polyolefin film armor
  [AD-A107562] N82-17377
LANDING AIDS
  Ground movement control and guidance - Cat. 3 operations experience in Air Inter
  A82-20222
LARGE SPACE STRUCTURES
  Fiscal year 1981 scientific and technical reports, articles, papers, and presentations
  [NASA-TM-82445] N82-16927
LASER ANEMOMETERS
  Development and laboratory testing of a thermal emission velocimeter for application to an erosion nose tip test facility
  [AD-A107713] N82-17482
LASER APPLICATIONS
  Mapping in tropical forests - A new approach using the laser APR --- Airborne Profile Recorder
  A82-20407
  Laser communications via an atmospheric link
  A82-20615
LASER RANGER/TRACKER
  Aircraft position measurement using laser beacon optics
  [AD-A107973] N82-16067
LATERAL CONTROL
  Analytical control law for desirable aircraft lateral handling qualities
  A82-21941
LATERAL STABILITY
  A new method of estimating the lateral wall effect on the airfoil incidence due to the suction at side walls
  [NAL-TR-680] N82-17123
LEADING EDGE FLAPS
  Recent advances in applying Free Vortex Sheet theory to the estimation of vortex flow aerodynamics
  [AIAA PAPER 82-0095] A82-22045
LEADING EDGES
  Alleviation of the subsonic pitch-up of delta wings
  [AIAA PAPER 82-0129] A82-22052
  Experimental study of delta wing leading-edge devices for drag reduction at high lift --- conducted in Langley 7- by 10-foot high speed tunnel
  N82-17125
LEWIS BASE
  Deposit formation in liquid fuels. I - Effect of coal-derived Lewis bases on storage stability of Jet A turbine fuel
  A82-22241
LIFE CYCLE COSTS
  Component research for future propulsion systems
  N82-17224
LIFT
  Application of thrust vectoring for STOL
  [AIAA PAPER 81-2616] A82-19205
  Unsteady lifting-line theory with applications
  [AIAA PAPER 82-0354] A82-19798
  The design of compact asymmetric maximum-thrust nozzles for a given lift force
  A82-19814
  Numerical calculation of lift, moment coefficient and dynamic stability derivatives on sideslipping wings in unsteady supersonic flows
  A82-22111
  A new method of estimating the lateral wall effect on the airfoil incidence due to the suction at side walls
  [NAL-TR-680] N82-17123
LIFT DRAG RATIO
  Experimental study of delta wing leading-edge devices for drag reduction at high lift --- conducted in Langley 7- by 10-foot high speed tunnel
  N82-17125
LIGHT AIRCRAFT
  An analytical technique for the analysis of airplane spin entry and recovery
  [AIAA PAPER 82-0243] A82-19786
LIGHTNING
  Conductive prepregs for lightning strike protection on aircraft
  A82-20523
LIGNITE
  Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
  [DE82-001127] N82-17401
LINE OF SIGHT COMMUNICATION
  Relay-augmented data links in an interference environment
  A82-20684
LINEAR SYSTEMS
  An application of total synthesis to robust coupled design --- turbojet engine control
  A82-19061

SPIN TESTS
Spin tests of a single-engine, high-wing light airplane
[NASA-TP-1927] N82-16068

SPOILERS
Basic studies of the flow fields of airfoil-flap-spoiler systems
[AIAA PAPER 82-0173] A82-22060
Summary of theoretical considerations and wind tunnel tests of an aerodynamic spoiler for stall proofing a general aviation airplane
[NASA-CR-165100] N82-16046

SPRAYED COATINGS
Improved plasma sprayed MCrAlY coatings for aircraft gas turbine applications
A82-20742

SPRAYERS
Helicopter icing spray system
A82-20754

SPREAD SPECTRUM TRANSMISSION
The influence of technology advances on integrated CNI avionics --- Integrated Communication, Navigation, and Identification Avionics for military aircraft
A82-20672

STABILITY DERIVATIVES
Analytical control law for desirable aircraft lateral handling qualities
A82-21941
Numerical calculation of lift, moment coefficient and dynamic stability derivatives on sideslipping wings in unsteady supersonic flows
A82-22111

STABILIZERS (FLUID DYNAMICS)
Some observations on the corrosion of aircraft at the air force base in Bandirma, Turkey
N82-17353

STANDARDIZATION
Standardization study for advanced aircraft armament system program
[AD-A107681] N82-17156

STATIC LOADS
Static investigations of rotor blades under deadweight and during stationary operation
[ISD-269] N82-17639

STATIC STABILITY
Control law development for a close-coupled canard, relaxed static stability fighter
[AIAA PAPER 82-0180] A82-19784

STATIC TESTS
Design features of a sea-based multipurpose V/STOL, STOVL, and STOL aircraft in a support role for the U.S. Navy
[AIAA PAPER 8 -2650] A82-19218
A comprehensive flight test flyover noise program
A82-20765
Static investigations of rotor blades under deadweight and during stationary operation
[ISD-269] N82-17639
Static and dynamic investigations for the model of a wind rotor
[ISD-272] N82-17642

STATISTICAL ANALYSIS
Prediction of aircraft interior noise using the statistical energy analysis method
[ASME PAPER 81-DET-102] A82-19332

STEADY FLOW
Steady and unsteady nonlinear hybrid vortex method for lifting surfaces at large angles of attack
[AIAA PAPER 82-0351] A82-22094

STEAM TURBINES
Influence of correlations and computational methods on the prediction of overall efficiency
N82-17180

STIFFNESS
Stiffness degradation of impact damaged structure
N82-17168

STORAGE STABILITY
Deposit formation in liquid fuels. II - The effect of selected compounds on the storage stability of Jet A turbine fuel
A82-22240
Deposit formation in liquid fuels. I - Effect of coal-derived Lewis bases on storage stability of Jet A turbine fuel
A82-22241

STORMS (METEOROLOGY)
X-band vs C-band aircraft radar - The relative effects of beamwidth and attenuation in severe storm situations
A82-19858

STRAIN GAGES
Ground calibration of a strain-gauged CT-4A aircraft (1979)
[AD-A107847] N82-16073

STRAPDOWN INERTIAL GUIDANCE
Calibrated and uncalibrated inertial navigation system performance in valid and jammed global positioning system environments
A82-21587
The application of strapdown inertial technology to Attitude and Heading Reference System requirements --- for YAH-64 advanced attack helicopter
A82-21590

STRESS ANALYSIS
Automated calculation of the stressed state of shell systems under asymmetrical mechanical and thermal loading
A82-19928
Multi-parameter yield zone model for predicting spectrum crack growth
A82-20510
Crack growth behavior of center-cracked panels under random spectrum loading
A82-20511
Random spectrum fatigue crack life predictions with or without considering load interactions
A82-20512

STRESS CONCENTRATION
Ground calibration of a strain-gauged CT-4A aircraft (1979)
[AD-A107847] N82-16073

STRESS CORROSION CRACKING
Corrosion Fatigue --- conferences
[AGARD-CP-316] N82-17342
Mechanisms of corrosion fatigue --- of high strength aluminum alloys
N82-17343
Fracture mechanics based modelling of the corrosion fatigue process
N82-17344
Corrosion prevention methods developed from direct experience with aerospace structures
N82-17359
Recent developments in materials and processes for aircraft corrosion control
N82-17361
New concepts in multifunctional corrosion for aircraft and other systems
N82-17362

STRESS INTENSITY FACTORS
Multi-parameter yield zone model for predicting spectrum crack growth
A82-20510
Crack growth behavior of center-cracked panels under random spectrum loading
A82-20511

STRESS-STRAIN RELATIONSHIPS
Studies on the stability of thin-walled shells with cutouts /Review/. I
A82-21629

STRESSED-SKIN STRUCTURES
Bolted field repair of graphite/epoxy wing skin laminates
A82-20981

STRIP TRANSMISSION LINES
Leaky wave antenna using an inverted strip dielectric waveguide --- for aircraft application
A82-19552

STRUCTURAL ANALYSIS
Quick learning diagnostics --- helicopter vibration analysis and component condition monitoring
A82-20543
Research and development program for non-linear structural modeling with advanced time-temperature dependent constitutive relationships
[NASA-CR-165533] N82-16080
Strength degradation of impact damaged structure
N82-17169

STRUCTURAL DESIGN
Optimal shape design of turbine blades
[ASME PAPER 81-DET-128] A82-19342

Calculation of sensitivity derivatives in thermal problems by finite differences A82-21391
Design Manual for impact damage tolerant aircraft structure [AGARD-AG-238] N82-17160

STRUCTURAL DESIGN CRITERIA
Application of structural optimization technique to reduce the external vibrations of a gas-turbine engine [ASME PAPER 81-DET-143] A82-19351
Predesign study for a modern 4-bladed rotor for the NASA rotor systems research aircraft [NASA-CR-166153] N82-16042

STRUCTURAL ENGINEERING
Pre-design study for a modern four-bladed rotor for the Rotor System Research Aircraft (RSRA) --- integrating the YAH-64 main rotor [NASA-CR-166154] N82-16043

STRUCTURAL FAILURE
Airworthiness of helicopter transmissions A82-20541
Quick learning diagnostics --- helicopter vibration analysis and component condition monitoring A82-20543
Hydrodynamic ram damage N82-17166
Strength degradation of impact damaged structure N82-17169

STRUCTURAL STABILITY
Stiffness degradation of impact damaged structure N82-17168
Stability and response to gravity of the flap lag motion for a rigid rotor blade with flap-pitch coupling [ISD-270] N82-17640

STRUCTURAL STRAIN
Analysis methods for predicting structural response to projectile impact N82-17162

STRUCTURAL VIBRATION
A comparative study on mechanical vibration and noise during patient transportation A82-19013
Analytical prediction of aerospace vehicle vibration environments [ASME PAPER 81-DET-29] A82-19305
Investigation of vibration of shrouded turbine blades [ASME PAPER 81-DET-129] A82-19343
An investigation of dual mode phenomena in a mistuned bladed-disk [ASME PAPER 81-DET-133] A82-19347
Measurement of the influence of flow distortions on the blade vibration amplitude in an air turbine [ASME PAPER 81-DET-135] A82-19348
Application of structural optimization technique to reduce the external vibrations of a gas-turbine engine [ASME PAPER 81-DET-143] A82-19351
Quick learning diagnostics --- helicopter vibration analysis and component condition, monitoring A82-20543
On-site vibration measurement, dynamic tracking and balancing A82-20545
Ice phobics blade tracking and comparison of vibration analysis techniques [AD-A108121] N82-16074

STRUCTURAL WEIGHT
Optimal shape design of turbine blades [ASME PAPER 81-DET-128] A82-19342
Integration of a code for aeroelastic design of conventional and composite wings into ACSYNT, an aircraft synthesis program --- wing aeroelastic design (WADES) [NASA-CR-137805] N82-16069

STRUTS
Multiple pure tone elimination strut assembly --- air breathing engines [NASA-CASE-FRC-11062-1] N82-16800

SUBSONIC AIRCRAFT
Thrust modulation methods for a subsonic V/STOL aircraft [AIAA PAPER 81-2633] A82-19213
Advanced subsonic transport propulsion [AIAA PAPER 81-0811] A82-20874
Numerical computation of unsteady subsonic aerodynamic forces on wing-body-tail exposed to travelling gust A82-22112

SUBSONIC FLOW
Aeroelastic characteristics of a cascade of mistuned blades in subsonic and supersonic flows [ASME PAPER 81-DET-122] A82-19337

controls are known, and variations on the instrumentation set-up are tested repeatedly. The AIDS concept allows remote location of a slide projector for closed circuit television display of various instrument configurations in different situations, and selected displays are chosen for full scale simulation. M.S.K.

A82-22905 **Combined multisensor displays.** A. J. Josefowitz, R. A. North (Honeywell Systems and Research Center, Minneapolis, MN), and J. Trimble (U.S. Navy, Office of Naval Research, Arlington, VA). In: Human Factors Society, Annual Meeting, 24th, Los Angeles, CA, October 13-17, 1980, Proceedings. Santa Monica, CA, Human Factors Society, Inc., 1980, p. 17-21. Contract No. N00014-77-C-0684.

The use of combined multisensor displays which result from preprocessing of various sensor data for shape coding in a display is discussed in terms of lowering the pilot's workload. A Forward Looking Infrared (FLIR) radar display was selected as the background for combinations with other sensor displays in trials of suitability, with color coded close, intermediate, and far range conditions. Test subjects were 32 right-handed males who performed point of impact, target detection, and tracking tasks. The variables were processed in univariate and multivariate analyses of combined and uncombined display types, and individual display comparisons by pairs. The combined displays were found to enhance the time-sharing of tasks with other crewmembers and the accurate detection of targets. Color coding is recommended to be of secondary value, with some results showing that colors actually slow response times. M.S.K.

A82-22974 **Direct comparison of community response to road traffic noise and to aircraft noise.** F. L. Hall, S. E. Birnie, S. M. Taylor, and J. E. Palmer (McMaster University, Hamilton, Ontario, Canada). *Acoustical Society of America, Journal*, vol. 70, Dec. 1981, p. 1690-1698. 23 refs. Research supported by the Transport Canada and Natural Sciences and Engineering Research Council of Canada.

Previous efforts to synthesize information on community responses to various noise sources have been forced to rely on a variety of surveys conducted in different countries over a number of years. Data collected recently around Toronto International Airport provide a direct comparison of response to two sources, based on 673 interviews of persons exposed to a variety of levels of both aircraft and road traffic noise. The results of that analysis do not support the assumption that response to these two noise sources is the same. For the same value of the 24-h energy-averaging metric, a greater percentage of the sample is highly annoyed by aircraft noise than by road traffic noise. Possible reasons for this contradiction of the results of a previous synthesis of noise surveys are discussed. (Author)

A82-23027 **GTD terrain reflection model applied to ILS glide scope.** R. Luebbers, V. Ungvichian, and L. Mitchell (Ohio University, Athens, OH). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 18, Jan. 1982, p. 11-20. 20 refs. USAF-supported research; U.S. Department of Transportation Contract No. FA7WA-3549.

A terrain reflection model based on the geometrical theory of diffraction is described which (1) can accommodate any piecewise linear terrain profile, (2) requires less computer time than physical optics models, (3) is capable of including transverse terrain effects, and (4) determines the reflected fields with all important diffraction and blockage effects included. The model's approach to the calculation of the reflected magnetic fields consists of a geometrical process by which the existence and the reflection and/or diffraction points of the rays are determined, and a mathematical process by which the magnitude and phase of the corresponding electric field at the receiver location are evaluated. O.C.

A82-23029 **Sensitivity reduction by double perfect model following.** T. Okada, M. Kihara, and K. Motoyama (Defense Academy, Yokosuka, Kanagawa, Japan). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 18, Jan. 1982, p. 29-38. 12 refs.

A double perfect model following (DPMF) system is proposed which uses two models: one is used to define the desirable response and the other is used to reduce sensitivity to parameter perturbation. The concept is shown and methods of model selection and controller synthesis are discussed, followed by numerical examples and an aircraft control example which demonstrate performance of the DPMF concept. It is shown that the DPMF system can be less sensitive than a nominally equivalent single perfect model following (SPMF) system and that sensitivity reduction is enhanced by proper selection of the model. It is also shown that the sensitivity of multi-input systems can be reduced componentwise or blockwise by using a decoupled type model. (Author)

A82-23031 # **Stereographic projection in the National Airspace System.** R. G. Mulholland and D. W. Stout (FAA, Technical Center, Atlantic City, NJ). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 18, Jan. 1982, p. 48-57. 10 refs.

Consideration is given to the calculation of stereographic representations of airborne targets from observations of slant range, azimuth, and altitude in a multiple radar tracking system. Emphasis is placed upon the translation of the accuracy of the surveillance information into the stereographic plane. Applications include air traffic control operations in which calculations must be performed repeatedly in real time for numerous targets without overtaxing available computational resources. (Author)

A82-23037 * **Methodology for multiaircraft minimum noise impact landing trajectories.** G. Cook, I. D. Jacobson, R. Chang, and R. Melton (Virginia, University, Charlottesville, VA). *IEEE Transactions on Aerospace and Electronic Systems*, vol. 18, Jan. 1982, p. 131-146. 14 refs. Grant No. NsG-1509.

The problem of optimizing landing trajectories with respect to noise impact index is addressed. In contrast with previous work, multilandings are considered. In order to make the problem tractable the trajectories are specified in functional form with certain parameters left free for selection by the optimization methods. Constraint of aircraft dynamic behavior, trajectory separation, pilot workload, passenger comfort, and maximum noise intensity all enter into the determination of what is an allowable trajectory. A version of the quasi-Newton iterative procedure is used to determine the optimum parameter values. The results show improvement in noise impact to the airport considered and the potential for even greater improvement at many airports. (Author)

A82-23225 **Linear alpha-ray altimeter (Lineinyi alpha radiatsionnyi vysotomer).** P. S. Kamenov, D. N. Vasilev, and E. N. Vapirev (Sofiiski Universitet, Sofia, Bulgaria). *Iadrena Energiia*, no. 15, 1981, p. 24-28. 8 refs. In Russian.

The paper describes an alpha-ray altimeter which employs scintillation detection and achieves linearity between the number of counts per unit time and the altitude. The design of the altimeter is described, and experimental results are presented. Causes of errors and nonlinearities are analyzed, and ways to reduce them are discussed. B.J.

A82-23227 # **Aircraft parameter identification in the presence of atmospheric turbulence.** H. Okubo (Osaka Prefecture University, Sakai, Japan), T. Kanou (Kawasaki Heavy Industries, Ltd., Akashi, Japan), and M. Kobayakawa (Kyoto University, Kyoto, Japan). *Kyoto University, Faculty of Engineering, Memoirs*, vol. 43, July 1981, p. 364-375. 7 refs.

The paper investigates a method for the identification of unknown parameters in the dynamics of an aircraft, using flight data which are affected by random disturbances due to wind gusts. Two general algorithms, the maximum likelihood (ML) method and the extended Kalman filter (EKF) technique, along with a combination of the algorithms are examined for capability by numerical simulations. The ML algorithm requires no a priori information on the initial parameter estimates, while the EKF algorithm computes an on-line estimate of the parameter in real time, has a smaller program size, and requires less computational time and memory than the former. The combined use of the two algorithms gives a useful method for an on-line parameter estimation, using the ML algorithm as a start-up procedure, and processing the remaining data sequentially with the EKF technique. D.L.G.

A82-23250 † **Improving the accuracy of the estimates of surfactant content in jet fuels (Povyshenie tochnosti otsenki soder-**

zhaniia par v reaktivnykh toplivakh). A. F. Gorenkov, V. S. Stepanenko, and V. A. Saleev. *Khimiia i Tekhnologiia Topliv i Masel*, no. 2, 1982, p. 36-39. In Russian.

Surface processes associated with the interaction between jet fuels and water are investigated with a view to increasing the accuracy of the estimates of surfactant content in jet fuels. It is shown that when analyzing water-fuel interaction, it is essential that the meniscus condition and the presence of drops on the test cylinder walls be taken into account. In view of this, modifications to the standard jet fuel quality control procedure are proposed. V.L.

A82-23309 **Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings.** Arlington, VA, Air Traffic Control Association, 1980. 204 p.

Developments towards higher levels of ATC automation are considered along with the requirements for reduced IFR separations on final approach, an analysis of system problems using aviation safety reporting system data, and specification issues and problems in connection with air traffic control computer replacement. Attention is given to maintenance concepts for the 1980's, approaches for reducing reflections on the front surface of air traffic control displays, the price of safety, general aviation in the future ATC system, the utilization of the helicopter's versatility to improve the ATC system, the human element, international plans concerning ATC-related developments, and challenges and issues for the future. Technological developments are discussed, taking into account distributed data processing modeling for future ATC systems, lightweight ATC systems, the Discrete Address Beacon System, voice communications, and a Microwave Landing System simulation. G.R.

A82-23311 **The requirements for reduced IFR separations on final approach.** W. J. Swedish (MITRE Corp., Metrek Div., McLean, VA). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 39-43. U.S. Department of Transportation Contract No. FA80WA-4370.

This paper examines the factors which affect the feasibility of reducing IFR standards from a minimum of 3.0 nmi to 2.5 or 2.0 nmi. For those aircraft pairs which are not restricted by wake vortices, separation reduction is likely to be limited by the rate at which aircraft must go around to avoid simultaneous runway occupancy. The runway occupancy performance required to avoid an unacceptable increase in the go-around rate is determined. The impacts of ATC improvements such as metering and spacing on the runway occupancy requirements and on the controller's decision-making workload are then presented. Alternating arrivals to close-spaced parallel runways are discussed as one means to avoid the constraints of runway occupancy and, possibly, wake vortices. Lastly, it is proposed that further research on reduced separations should address a single specific airport, in order to narrow the range of variables and thereby facilitate the identification of problems and solutions. (Author)

A82-23312 **Analysis of system problems using aviation safety reporting system data.** R. L. Grayson (Battelle Columbus Laboratories, Mountain View, CA). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 45-49.

The Aviation Safety Reporting System (ASRS) was inaugurated in 1976 as the result of an interagency agreement between the FAA and NASA. It was designed as a confidential, voluntary reporting system to enable individual users or observers of the National Aviation System to record hazardous occurrences or to report conditions which might adversely affect aviation safety. A description is presented of the system operation, the characteristics of the data base compiled by the system as the principal information source, and the ways in which the system has helped in defining and clarifying various aviation system problems. G.R.

A82-23313 **Air Traffic Control computer replacement - Specification issues and problems.** T. L. Hannan and M. E. Perie (FAA, Washington, DC). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 51-56.

The foundation of today's Air Traffic Control (ATC) system is the ATC specialist, who is supported by ATC automation systems and automated radar terminal systems. According to many ATC experts, however, the computer will become the foundation of the future ATC system. The transition to the future ATC system will be gradual. The extent to which decision-making processes will be accomplished automatically will increase until significant elements of the ATC process are controlled by the computer. Attention is given to an ATC Computer Replacement System which is suited for the evolutionary transition process. In the form of its initial implementation, the new system must be compatible with the ongoing ATC system. But it must also be capable of meeting future ATC functional requirements as it evolves toward automated decision-making. The considered requirements are examined in an attempt to define the scope of the ATC computer replacement acquisition. G.R.

A82-23314 **Reducing reflections on the front surface of air traffic control displays.** J. W. Aschenbach (FAA, Technical Center, Atlantic City, NJ). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 65-71. 5 refs.

Problems related to the occurrence of surface reflections on the FAA's en route air traffic control displays have become more serious in connection with the installation of the near vertical stroke-writing display in the air route traffic control centers. New investigations were initiated to see if it was feasible to raise the display background level, in order to mask reflections and to further reduce the sources of plan view display screen reflections through more modifications to the lighting. A study was conducted with the objective to find a method of decreasing the reflectivity of the front surfaces of the display itself. By eliminating the extra panel on the front of the display and by etching and coating the outside surface of the CRT with a multilayer dielectric thin film, it was possible to produce a display with very little glare. G.R.

A82-23315 **NAS system load - Utilization of the DARC system.** E. P. Schmidt (FAA, Hampton, GA). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 73-78.

In connection with an unexpectedly large increase in air traffic volume, there is a growing threat that ATS requirements might exceed the processing capacity of the NAS En Route 9020 computer systems. An investigation is conducted concerning the feasibility of providing an interim solution to the problem by means of an approach based on the utilization of existing hardware allocations. The approach would employ the Direct Access Radar Channel (DARC) system as an associative processor to the NAS 9020 system. DARC is specified to provide a parallel radar data path for use in the event of catastrophic failure of the prime channel, and during planned down time of the NAS 9020 system. G.R.

A82-23316 **Utilizing the helicopter's versatility to improve the ATC system.** A. G. B. DeLucien and F. D. Smith (Pacer Systems, Inc., Arlington, VA). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 89-96. 14 refs.

This paper presents an overview of certain operating environments of civilian helicopters, and summarizes selected performance-maneuver envelopes of those models certified for operation under instrument flight rules (IFR). It discusses how the capabilities and limitations which are unique to these vehicles can be used to improve the capability, and expand the capacity, of the Air Traffic Control (ATC) system. Helicopter-oriented technical issues which will impact future changes to the system are identified. The paper concludes that as controllers become increasingly aware of related helicopter characteristics and operating environments, and take advantage of them, the effect would be to reduce controller workload; and to increase the capacity, expand the functional capabilities, and enhance the overall versatility of the ATC system. (Author)

Co., Fairfield, CT). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811052.* 15 p.

Powerplant operational and maintenance procedures are reviewed to minimize fuel consumption and total operating costs of existing large turbofan engines. Recommendations are made to reduce the rate of on-wing performance deterioration and to define cost effective performance refurbishment. Measures being taken to increase fuel and cost savings include the development of performance diagnostic/analytical systems to permit better management control of engine operating costs. On-wing performance retention can be improved by the observance of line maintenance and operational procedures minimizing the impact of the major causes of performance deterioration, such as increased clearances, erosion, contamination and leakage. D.L.G.

A82-24395 **Airline fuel saving through JT9D engine refurbishment.** J. W. Allison and D. R. Weisel (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811051.* 12 p.

Since the JT9D engine entered airline service in 1970, increase in the price of jet fuel made it imperative to devise refurbishment procedures for in-service engines to improve their fuel economy. Developments leading to performance recovery and improvement of the engine are related to fan leading edge rework, and the one degree open first stator. Factors responsible for engine performance recovery and retention include also operational procedures, test configuration, and prevention of aircraft system pneumatic leakage. Attention is given to the fan strip panel concentric grinding tool, a properly repaired combustor with recently developed 'S-16' fuel nozzles, recommended refurbishment additions, operational procedures to maximize performance retention, a test configuration, and inspection techniques. G.R.

A82-24396 **Airworthiness considerations in the design of commercial transport aircraft.** J. R. Koch (Lockheed-California Co., Burbank, CA). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811039.* 14 p. 8 refs.

Design requirements and development, and the maintenance practices required in the certification of commercial transport aircraft and in the ensuring of their continuous airworthiness in operation, are considered with attention to: (1) airworthiness philosophy and criteria; (2) the evolutionary character of design development; (3) the scope of development testing; and (4) the enlistment of manufacturer, operator and regulatory agency in airworthiness assurance throughout an aircraft's operational life. Also considered are the airworthiness regulation revisions and technological advances that have resulted in changes in the substantiation of airworthiness, especially in the case of structures. O.C.

A82-24397 **Designing for continued airworthiness - General aviation.** C. A. Rembleske (Beech Aircraft Corp., Wichita, KS). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811038.* 8 p.

The Air Commerce Act of 1926 became the first piece of U.S. legislation which provided a basis for the writing of airworthiness standards for aircraft. The contents of the Air Commerce Regulations are briefly discussed. In connection with the technological developments of a rapidly growing industry, the regulations became more complex. Beginning in 1974, FAA introduced the term 'continued airworthiness'. Continuing airworthiness can be defined as keeping the aircraft flying safely and functioning properly over an indefinite period. Attention is given to the airframe, the propulsion system, basic flight instruments, vital hydraulic lines, fuel systems, electrical systems, and problems of wear and tear. G.R.

A82-24398 **The anatomy of a technology test bed - Integrated Flight/Fire Control-I /IFFC I/.** V. M. Marti, J. Woods, Jr. (McDonnell Aircraft Co., St. Louis, MO), and W. F. Swartz (USAF, Wright Aeronautical Laboratories, Dayton, OH). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811036.* 17 p.

The purpose of technology demonstration is to reduce the risk associated with developing an advanced operational system by verifying the capability of advanced, and as yet unproven, technologies. Attention is given to today's conditions which require the use of a technology demonstrator aircraft, principally as a precursor to future military tactical aircraft systems. The ingredients of a good technology demonstrator are examined, taking into account the selection of the F-15B aircraft for the technology demonstration of the Integrated Flight and Fire Control (IFFC) program. The IFFC system concept is considered along with the IFFC data acquisition systems, and the IFFC onboard simulation systems. G.R.

A82-24399 **Mission-adaptive wing flight demonstration program.** D. K. Gould (Boeing Co., Seattle, WA). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811035.* 10 p.

It is reported that the design and fabrication of the AFTI/F-111 mission-adaptive wing is nearing completion. The variable-camber airfoil design, unlike conventional wings, possesses no discontinuities from spoilers, flaps or fairings to disturb the flow of air over the wing. The flexible leading edge is continuous from wing root to tip, and the flexible trailing edge is divided into three segments to provide roll control redundancy, permit operation at various sweep-settings of the F-111 variable wing, and to allow spanwise shifting of the aerodynamic load. Wind tunnel and flight simulation tests indicate aerodynamic performance benefits, and the structural capability that has been checked by finite element analysis is in turn verified by tests of a wing section loads and actuation test rig. Flight tests are to begin in late 1982. O.C.

A82-24400 **Quality, quantity, and technology - A perspective on fighter development.** S. K. Jackson, Jr. (General Dynamics Corp., Fort Worth, TX). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811097.* 14 p. 7 refs.

The consequences of long-term technological development on military aircraft unit costs are illustrated, by means of comparisons between the capabilities and costs of such World War II aircraft as the P-51 fighter and B-17 bomber, on the one hand, and the contemporary F-16 fighter, on the other. A detailed historical analysis of the B-17 Schweinfurt raids and the extrapolation of the capabilities of the F-16 to that 1943 scenario shows that, while the modern fighter is able to deliver a greater bomb load with greater accuracy in a greater variety of conditions than the B-17, its cost, as a fraction of GNP, is only 1.6-2.3 times greater than that of the B-17. Similar improvements are demonstrated for the cases of operational readiness and numbers of maintenance personnel, showing that the continuing development of airframes is justified. The development of experimental aircraft is recommended. O.C.

A82-24401 * **Aircraft surface coatings for drag reduction/erosion protection.** R. L. Kreitinger (Boeing Commercial Airplane Co., Renton, WA) and D. B. Middleton (NASA, Langley Research Center, Hampton, VA). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811070.* 16 p. 5 refs.

The laboratory testing of a large number of films and liquid coatings for aircraft drag reduction and erosion protection has led to the identification of elastomeric polyurethanes, which fulfil smoothness, durability and protection requirements while being easily applied to large, compound-curvature areas with standard spray equipment. It was found that an epoxy primer produced a stronger bond between coating and substrate than a wash primer. A drag-reduction value of 0.2% was achieved with a commercially-available elastomeric polyurethane. O.C.

A82-24403 **Future strike fighter options - Concepts and technologies.** P. C. Bavitz (Grumman Aerospace Corp., Bethpage, NY). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811099.* 19 p. 10 refs.

Results are presented from a study of concepts of operation, and the technological capabilities required by them, for future strike fighter weapon systems. The design concepts considered by the study were: (1) a low-altitude, medium-payload twin-turbofan design with mission-adaptive supercritical wing and close-coupled canard; (2) a low-altitude, heavy-payload craft with top-mounted inlets; (3) a high-altitude concept with advanced turbojet engines and Alben-type nozzles, equipped with air-to-ground weapons that are currently in the conceptual-development stage; (4) a high-altitude/dive mission-profile craft possessing high payload/weapon carriage flexibility; (5) an advanced, low radar cross section design incorporating a delta wing planform, flush engine inlets and a top-mounted carriage for WASP weapons; and a gunship with a single, top-mounted turbojet whose primary armament is a GAU-8 30 mm cannon. O.C.

A82-24404 **Technology for quality and quantity in a new fighter.** W. E. Maillard (Northrop Corp., Los Angeles, CA). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811100.* 15 p. 15 refs.

It is demonstrated to be premature, in view of the complex and evolving character of tactical aircraft design problems requiring tradeoffs between system quality and production quantities, to hold a single design concept as superior to alternatives. However, technology application is held to be essential for the mediation of quality and quantity criteria. After identifying such major forces in cost escalation as the compounding of requirements and technology-packing, in response to mission requirement uncertainties over the course of a lengthy design development process, a design approach to lower-cost fighter concepts is introduced and quantitative methods are presented to illustrate potential improvements in the operational capabilities of aircraft in the size and cost range represented by the F-5E and F-16 fighters. O.C.

A82-24405 **Operating flight loads and their effect on engine performance.** R. L. Martin (Boeing Commercial Airplane Co., Renton, WA) and W. J. Olsson (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811071.* 14 p.

Flight loads imposed on high bypass turbofan engines and the response of the engines to these loads are examined. The effects of nacelle angle of attack, aircraft speed, and engine airflow are discussed. Results from an analysis of the NASA JT9D flight load test indicate that aerodynamic loads on the nacelle are the prime cause of cold section clearance closure and rubs; and aerodynamic loads, thrust, and differential thermal expansion cause hot section closure and rubs. Inboard and outboard engines are found to be equally affected by flight maneuvers, and a 0.7% increase in cruise thrust-specific fuel consumption is found to be typical of production aircraft acceptance testing. D.L.G.

A82-24406 **Restoration of performance, Models 727, 737, and 747.** J. C. Baer and W. M. Staab (Boeing Commercial Airplane Co., Seattle, WA). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811072.* 12 p.

A new generation of advanced technology, fuel-efficient jet transports, including the Models 757 and 767 will enter commercial airline service in 1982. Existing fleets of second-generation jet transports still in production, such as the 727, 737, and 747, have useful economic lives which will extend into the 1990s. Because of this longevity and the continual escalation of fuel prices, the economics of these transports will be improved. A description is presented of some of the performance improvement programs. Attention is given to aspects of operational efficiency, the in-flight fuel economy, a maintenance program to preserve low drag characteristics for the aircraft, the elimination of surface roughness, Model 727 drag improvement items, Model 747 improvement items, recently developed items, aerodynamic improvements under study, and propulsion system and flight management system improvements. G.R.

A82-24407 **High temperature engine control electronics.** D. C. Dening (General Electric Co., Syracuse, NY). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811074.* 11 p. Contract No. N00173-79-C-0010.

Integrated injection logic is shown to be operable at temperatures up to 300 C. The logic can thus be used in the digital control mounted on aircraft engines, where it is subjected to high temperatures and severe vibration. The design of integrated injection logic circuits for such high-temperature applications is discussed. Particular attention is given to gate design, to the patterns of interconnection, and to the metallization system employed. Also described is a data input chip for an engine control computer that has been designed for high-temperature applications. C,R.

A82-24408 **Pressure transducer calibration process.** F. Antonazzi, Sr. (Bendix Corp., Energy Controls Div., South Bend, IN). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811076.* 9 p.

It is shown that quartz capsule pressure transducers using a closed loop capacitance bridge can be made highly accurate with virtually identical frequency response by using a calibration process that compensates for the quartz pressure sensor unit-to-unit variations. Digital integration gain scheduling as a function of N count results in a constant loop gain that is independent of pressure level. As a consequence, constant dynamic characteristics are obtained at all pressure levels. It is noted that plug-in pressure transducer units are interchangeable, requiring no select-at-test components or trim adjustments. The software loop closure allows use of a common printed wiring board with identical electrical components for a wide range of pressure transducers. C.R.

A82-24409 **Performance retention features of the PW2037.** J. K. Carriere (United Technologies Corp., Pratt and Whitney Aircraft Group, East Hartford, CT). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811054.* 14 p.

Studies that have been carried out on the causes of performance deterioration are surveyed, as are descriptions of design and maintenance features for improving performance retention. It is noted that short-term deterioration is caused by flight loads that cause rubbing of blades on seals and consequent loss of module efficiencies. Long-term deterioration derives from erosion of airfoils and seals during ground operation and cyclic-induced thermal distortion of the high-pressure turbine vanes. Design features for improving performance retention include increased case and rotor stiffness, damped bearings on centering springs, a third low rotor bearing, active clearance control, abradable blade tips seals, controlled diffusion airfoils, dirt removal scoop, erosion-resistant compressor outer air seals, improved diffuser and combustor and reduced aspect ratio turbine vanes. C.R.

A82-24410 **Reliability analysis of a dual-redundant engine controller.** E. Gai, J. V. Harrison, and R. H. Luppold (Charles Stark Draper Laboratory, Inc., Cambridge, MA). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811077.* 11 p.

A Markov model is developed for predicting the reliability of a full-authority, dual-redundant aircraft engine controller. The effects of failures on any of the controller's sensors, electronic interface modules, processors and actuators are modeled, as are the consequences of redundancy management decisions. The model's use in performing parameter sensitivity studies and developing quantitative data in support of design trade-offs is described. The effects of scheduled maintenance on the inflight shutdown rate of the engine are assessed. C.R.

A82-24411 **Propulsion multiplexer /PMUX/ system - The missing link.** M. S. Latina and W. W. Hixson (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811078.* 10 p. 7 refs.

The importance placed by commercial airlines on more efficient and reliable engines with lower maintenance costs has led to the use of in-flight engine condition monitoring equipment as part of an airborne integrated data system (AIDS). This monitoring requires that the AIDS receive approximately 25 engine parameter signals. Problems arise in that the integrity of the AIDS input signals from the engine is not the responsibility of a single equipment supplier. To resolve this problem, a centralized, engine-mounted data processing device for the engine signals is proposed. It is pointed out that the unit for this Propulsion Multiplexer System can be divided into three major functional groups: (1) pressure sensors and signal interfaces, (2) digital processor and memory, and (3) serial digital data interface. DIPOLE ANTENNAS
Octave bandwidth dual polarized antenna
A82-18934

DISPLAY DEVICES
Data base generation for digital external view systems
[DGLR PAPER 81-101] A82-19270
System for providing an integrated display of instantaneous information relative to aircraft attitude, heading, altitude, and horizontal situation
[NASA-CASE-FRC-11005-1] N82-16075
Threat perception while viewing single intruder conflicts on a cockpit display of traffic information
[NASA-TM-81341] N82-16076
Aircraft alerting systems standardization study. Volume 2: Aircraft alerting system design guidelines
[AD-A106732] N82-16077

DISTANCE MEASURING EQUIPMENT
MLS flare low elevation angle guidance considerations
A82-20586
Terminal area automatic navigation, guidance, and control research using the Microwave Landing System (MLS). Part 3: A comparison of waypoint guidance algorithms for RNAV/MLS transition
[NASA-CR-3512] N82-16060

DISTRIBUTED PARAMETER SYSTEMS
Tactical Airborne Distributed Computing and Networks
[AGARD-CP-303] N82-17086
Distributed data processing: What is it?
N82-17087
The effect of increasingly more complex aircraft and avionics on the method of system design
N82-17088
A tutorial on distributed processing in aircraft/avionics applications
N82-17089
Functional versus communication structures in modern avionic systems
N82-17092
Economic considerations for real-time naval aircraft/avionics distributed computer control systems
N82-17097
A reconfigurable change network for distributed process control
N82-17108
Integrated control of mechanical system for future combat aircraft
N82-17117
F/A-18A tactical airborne computational subsystem
N82-17119
F/A-18 weapons system support facilities
N82-17120

DOCUMENTS
Design and maintenance against corrosion of aircraft structures
N82-17356

DOPPLER RADAR
Design criteria for a miss distance radar
A82-18904
R.F. calibrators for Doppler radars
A82-18917

DOWNWASH
Surveys of flow-field around empennage of the NAL STOL-research-aircraft model
[NAL-TR-677] N82-17124

DRAG REDUCTION
Three-dimensional calculation of the flow in helicopter air intakes
[ONERA, TP NO. 1981-124] A82-19740
Wing-canard aerodynamics at transonic speeds - Fundamental considerations on minimum drag spanloads
[AIAA PAPER 82-0097] A82-22046
Aerodynamic characteristics of maneuvering flaps
A82-22110
Experimental study of delta wing leading-edge devices for drag reduction at high lift --- conducted in Langley 7- by 10-foot high speed tunnel
N82-17125

DROP SIZE
Helicopter icing spray system
A82-20754

DYNAMIC MODELS
Development of a correlated finite element dynamic model of a complete aero engine
[ASME PAPER 81-DET-74] A82-19326
Application of structural optimization technique to reduce the external vibrations of a gas-turbine engine
[ASME PAPER 81-DET-143] A82-19351

DYNAMIC RESPONSE
Dynamic response of blades and vanes to wakes in axial turbomachinery
[ASME PAPER 81-DET-33] A82-19307
Optimum journal bearing parameters for minimum rotor unbalance response in synchronous whirl
[ASME PAPER 81-DET-55] A82-19314
An investigation of dual mode phenomena in a mistuned bladed-disk
[ASME PAPER 81-DET-133] A82-19347
A parametric study of dynamic response of a discrete model of turbomachinery bladed disk
[ASME PAPER 81-DET-137] A82-19349
Numerical and flight simulator test of the flight deterioration concept
[NASA-CR-3500] N82-16655
Analysis methods for predicting structural response to projectile impact
N82-17162
CF6 jet engine performance improvement: High pressure turbine roundness
[NASA-CR-165555] N82-17174
Problems of engine response during transient maneuvers
N82-17221
Rotor model for the verification of computational methods
[ISD-275] N82-17638

DYNAMIC STRUCTURAL ANALYSIS
Modal analysis using helicopter dynamic test data
[ASME PAPER 81-DET-30] A82-19306
Development of a correlated finite element dynamic model of a complete aero engine
[ASME PAPER 81-DET-74] A82-19326
Natural frequencies of rotating bladed discs using clamped-free blade modes
[ASME PAPER 81-DET-124] A82-19338
On the formulation of coupled/uncoupled dynamics analyses of blade-disc assemblies
[ASME PAPER 81-DET-126] A82-19340
Investigation of vibration of shrouded turbine blades
[ASME PAPER 81-DET-129] A82-19343
Study of ground handling characteristics of a maritime patrol airship
[NASA-CR-166253] N82-16090
Design Manual for impact damage tolerant aircraft structure
[AGARD-AG-238] N82-17160

Dynamic analysis of a rotor blade with flap and lag freedom and flap-pitch coupling
[ISD-271] N82-17641
Static and dynamic investigations for the model of a wind rotor
[ISD-272] N82-17642

E

EARTH RESOURCES
VTOL as it applies to resource development in the Canadian north
[AIAA PAPER 81-2640] A82-19215
ECONOMIC ANALYSIS
Economic considerations for real-time naval aircraft/avionics distributed computer control systems
N82-17097
ECONOMIC FACTORS
Economic considerations for real-time naval aircraft/avionics distributed computer control systems
N82-17097
Energy environment study
[NASA-CR-168458] N82-17654
EDDY CURRENTS
Low-frequency eddy current inspection of aircraft structure
A82-21900
EJECTION SEATS
A generalized escape system simulation computer program: A user's manual
[AD-A106152] N82-16055
EJECTORS
Application of thrusting ejectors to tactical aircraft having vertical lift and short-field capability
[AIAA PAPER 81-2629] A82-19211
Technology overview for advanced aircraft armament system program
[AD-A107680] N82-17155
ELASTIC SHELLS
Automated calculation of the stressed state of shell systems under asymmetrical mechanical and thermal loading
A82-19928
ELECTRIC CONNECTORS
Corrosion in naval aircraft electronic systems
N82-17363
ELECTRIC EQUIPMENT
Aircraft electrical equipment - Design and operation --- Russian book
A82-18998
ELECTRIC POWER SUPPLIES
Aircraft electrical equipment - Design and operation --- Russian book
A82-18998
Power system design optimization using Lagrange multiplier techniques
A82-20743
ELECTRO-OPTICS
Simulation of advanced cockpits
A82-19259
ELECTROCHEMISTRY
Corrosion protection schemes for aircraft structures: Some examples for the corrosion behaviour of Al alloys
N82-17364
ELECTROMAGNETIC INTERFERENCE
Relay-augmented data links in an interference environment
A82-20684
ELECTRONIC AIRCRAFT
Very high speed integrated circuits: Into the second generation. II - Entering Phase 1
A82-21848
ELECTRONIC CONTROL
The significance of electronics for air traffic control at the present time and in the future
A82-19649
Energy management in military combat aircraft
A82-20515
The control of aircraft gas turbines for fuel economy
A82-20516
The impact of increasing energy costs upon the design philosophy of avionic fuel management systems
A82-20517
Thrust management - Current achievements and future developments
A82-20520
ELECTRONIC COUNTERMEASURES
Octave bandwidth dual polarised antenna
A82-18934
An analysis of antijam communication requirements in fading media
A82-20695
ELECTRONIC EQUIPMENT
The significance of electronics for air traffic control at the present time and in the future
A82-19649
ELECTRONIC EQUIPMENT TESTS
Built-in-test Equipment Requirements Workshop. Workshop presentation
[AD-A107842] N82-17085
ELECTRONIC WARFARE
Properties of the new flight and tactics simulators
[DGLR PAPER 81-106] A82-19265
ELEVATION ANGLE
MLS flare low elevation angle guidance considerations
A82-20586
Experimental measurement of the low angle terrain scattering interference environment
A82-20588
Comparison of various elevation angle estimation techniques
A82-20589
EMBRITTLEMENT
Mechanisms of corrosion fatigue --- of high strength aluminum alloys
N82-17343
EMERGENCIES
Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports
A82-19001
The marketing, organisation and financing of aeromedical evacuation by a motoring organisation
A82-19002
Survey of aeromedical evacuation in Italy
A82-19003
The network of civilian air rescue in Germany
A82-19004
Aerial ambulance service in Australia
A82-19007
Flying doctor service in East Africa
A82-19008
Air ambulance systems in the Republic of South Africa
A82-19009
The situation of air rescue in Argentina
A82-19010
Aeromedical evacuation in New Zealand
A82-19011
Helicopter secondary applications for neurotraumatic emergencies
A82-19015
Helicopters - Night operations
A82-19017
The helicopter in rescue operations in high-mountain areas
A82-19019
Application of the ABC helicopter to the emergency medical service role
[AIAA PAPER 81-2653] A82-19219
EMERGENCY LOCATOR TRANSMITTERS
Special investigation report. Search and rescue procedures and arming of emergency locator transmitter: Aircraft accident near Michigan City, Indiana, 7 December, 1980
[PB81-249427] N82-16058
ENERGY CONSERVATION
Energy management and its impact on avionics; Proceedings of the Symposium, London, England, March 19, 1981
A82-20513
General aviation fuel conservation in the 1980's
A82-20757
Symposium on commercial-aviation energy-conservation strategies
[DE81-028406] N82-16057
ENERGY TRANSFER
Prediction of aircraft interior noise using the statistical energy analysis method
[ASME PAPER 81-DET-102] A82-19332

LIQUID FUELS
Deposit formation in liquid fuels. I - Effect of coal-derived Lewis bases on storage stability of Jet A turbine fuel
A82-22241
LIQUID HYDROGEN
The prospects for liquid hydrogen fueled aircraft
A82-20137
LOAD DISTRIBUTION (FORCES)
A practical approach to systems mode analysis --- for disc-blade-shroud assemblies
[ASME PAPER 81-DET-130] A82-19344
Analysis methods for predicting structural response to projectile impact
N82-17162
Stiffness degradation of impact damaged structure
N82-17168
Analysis of multiple load path panels containing impact damage
N82-17170
LOADING OPERATIONS
QOT and E of the F-16 20mm ammunition loading system's ability to upload/download A-7D aircraft
[AD-A108007] N82-16099
LOADS (FORCES)
Flight-by-flight corrosion fatigue tests
N82-17348
LOFTING
Computer graphics for quality assurance
A82-20276
LOGIC DESIGN
Stage-state reliability analysis technique
N82-17104
Active beacon collision avoidance logic evaluation. Volume 2: Collision avoidance (BCAS) threat phase
[AD-A107805] N82-17148
LONG TERM EFFECTS
Environmental exposure effects on composite materials for commercial aircraft
[NASA-CR-3502] N82-16178
LONGITUDINAL STABILITY
Summary of theoretical considerations and wind tunnel tests of an aerodynamic spoiler for stall proofing a general aviation airplane
[NASA-CR-165100] N82-16046
LOW ALTITUDE
Tracking of low-altitude targets by a combined X/Ka-band radar system
A82-20590
A simulator assessment of a wide field of view head-up display for presenting a FLIR sensor image during low level navigation and ground attack missions
[AIAA PAPER 82-0261] A82-22079
LOW ASPECT RATIO WINGS
An experimental study of separated flow on a finite wing
[AIAA PAPER 81-1882] A82-20293
LOW COST
Minimum cost performance monitoring of turboshaft engines
A82-20544
LOW SPEED
Can low-speed jet noise be predicted
A82-22222
A versatile data acquisition system for a low speed wind tunnel
[AD-A106269] N82-16097
LOW SPEED WIND TUNNELS
Experimental studies of the Eppler 61 airfoil at low Reynolds numbers
[AIAA PAPER 82-0345] A82-19796
Scale-model studies for the improvement of flow patterns of a low-speed tunnel
[NASA-CR-169413] N82-17228
LUBRICANT TESTS
Development of the automated AFAPL engine simulator test for lubricant evaluation
[AD-A106128] N82-16093
LUBRICANTS
Trends in aviation fuels and lubricants; Proceedings of the West Coast International Meeting, Seattle, WA, August 3-6, 1981
A82-19621
The history of aviation turbine lubricants
A82-19624
LUBRICATING OILS
A history of aircraft piston engine lubricants
A82-19622
Development of the automated AFAPL engine simulator test for lubricant evaluation
[AD-A106128] N82-16093
LUBRICATION
Lubrication breakdown between gear teeth
N82-17213

M

MACH NUMBER
Measurements of a three-dimensional boundary layer on a sharp cone at Mach 3
[AIAA PAPER 82-0289] A82-22083
MAINTENANCE
Maintenance posture for quick start
[AD-A107553] N82-17177
Forecasting corrosion damage and maintenance costs for large aircraft
N82-17357
MAN MACHINE SYSTEMS
Flight simulation consoles, aid or obstruction - Objective evaluation of control consoles of modern flight and tactics simulators
[DGLR PAPER 81-097] A82-19269
MANAGEMENT METHODS
Design and maintenance against corrosion of aircraft structures
N82-17356
MANEUVERABILITY
The armed helicopter in air to air missions
[MBB-UD-317-81-O] N82-17158
MANUAL CONTROL
An investigation of multi-axis isometric side-arm controllers in a variable stability helicopter
[AD-A106759] N82-17226
MARINE ENVIRONMENTS
Offshore uses of the airship
A82-20553
The airship - Its application and promotional activity
A82-20555
MARKET RESEARCH
A perspective on civil use of GPS
A82-21589
Assessment of historical and projected segments of US and World civil and military rotorcraft markets 1960 - 1990
[NASA-CR-166151] N82-17137
MARKETING
The marketing, organisation and financing of aeromedical evacuation by a motoring organisation
A82-19002
MATERIAL BALANCE
Balancing of flexible rotors by the complex modal method
[ASME PAPER 81-DET-46] A82-19310
MATHEMATICAL MODELS
Analytical prediction of aerospace vehicle vibration environments
[ASME PAPER 81-DET-29] A82-19305
A parametric study of dynamic response of a discrete model of turbomachinery bladed disk
[ASME PAPER 81-DET-137] A82-19349
Can low-speed jet noise be predicted
A82-22222
Finite difference computation of the conical flow field over a delta wing
[VKI-TN-140] N82-17135
MECHANICAL PROPERTIES
Composite structural materials --- fiber reinforced composites for aircraft structures
[NASA-CR-165121] N82-16182
MEDICAL EQUIPMENT
Aircraft for secondary long range emergency ambulance flight
A82-19021
MEDICAL PERSONNEL
Flying doctor service in East Africa
A82-19008
MEDICAL SERVICES
Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports
A82-19001

The marketing, organisation and financing of aeromedical evacuation by a motoring organisation A82-19002

Survey of aeromedical evacuation in Italy A82-19003

The network of civilian air rescue in Germany A82-19004

Ambulance helicopter in the Stockholm archipelago A82-19005

Military assistance to safety and traffic /MAST/ A82-19006

Aerial ambulance service in Australia A82-19007

Flying doctor service in East Africa A82-19008

Air ambulance systems in the Republic of South Africa A82-19009

The situation of air rescue in Argentina A82-19010

Aeromedical evacuation in New Zealand A82-19011

A comparative study on mechanical vibration and noise during patient transportation A82-19013

Helicopter secondary applications for neurotraumatic emergencies A82-19015

Problems pertaining to aeronautical technology in the case of rescue operations with helicopters in mountainous areas A82-19018

The helicopter in rescue operations in high-mountain areas A82-19019

Aircraft for secondary long range emergency ambulance flight A82-19021

Application of the ABC helicopter to the emergency medical service role [AIAA PAPER 81-2653] A82-19219

MEDITERRANEAN SEA

Structure and variability of the Alboran Sea frontal system A82-20447

MELTING

Development of in-can melting process and equipment, 1979 and 1980 [DE82-001050] N82-16834

METAL BONDING

The experience of corrosion on French military aerodynes N82-17355

METAL COATINGS

Improved plasma sprayed MCrAlY coatings for aircraft gas turbine applications A82-20742

METAL FATIGUE

Methods and models for predicting fatigue crack growth under random loading --- Book A82-20506

A crack-closure model for predicting fatigue crack growth under aircraft spectrum loading A82-20509

Low-frequency eddy current inspection of aircraft structure A82-21900

METAL SURFACES

Impingement cooling of concave surfaces of turbine airfoils A82-18894

METEOROLOGICAL RADAR

X-band vs C-band aircraft radar - The relative effects of beamwidth and attenuation in severe storm situations A82-19858

METEOROLOGICAL SERVICES

FAA/NWS aviation route forecast /ARF/ development [AIAA PAPER 82-0013] A82-22027

MICROPROCESSORS

Energy management in military combat aircraft A82-20515

The control of aircraft gas turbines for fuel economy A82-20516

Advanced recorder design and development [PB81-244105] N82-16385

MICROPROGRAMMING

Implementation of the recommendations made on the technical report titled analysis of advanced simulator for pilot training [AD-A106779] N82-16094

MICROWAVE EQUIPMENT

Microwave systems for radar guided missiles A82-18936

MICROWAVE LANDING SYSTEMS

Development of a digital integrated automatic landing system /DIALS/ for steep approach and landing A82-20297

MLS flare low elevation angle guidance considerations A82-20586

Terminal area automatic navigation, guidance, and control research using the Microwave Landing System (MLS). Part 3: A comparison of waypoint guidance algorithms for RNAV/MLS transition [NASA-CR-3512] N82-16060

Terminal area automatic navigation, guidance, and control research using the Microwave Landing System (MLS). Part 2: RNAV/MLS transition problems for aircraft [NASA-CR-3511] N82-17142

MICROWAVE RADIOMETERS

Airborne measurements with a sensitive high resolution 90 GHz radiometer A82-18940

A study of potentially low cost millimetre-wave radiometric sensors A82-18942

Radiometric measurements at 80 GHz A82-18943

MICROWAVE SCATTERING

Experimental measurement of the low angle terrain scattering interference environment A82-20588

MICROWAVE TRANSMISSION

Microwave communications to remotely piloted vehicles A82-18911

Microwave systems for radar guided missiles A82-18936

MILITARY AIRCRAFT

Application of thrusting ejectors to tactical aircraft having vertical lift and short-field capability [AIAA PAPER 81-2629] A82-19211

Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981 A82-20526

The uses of airships in the Royal Navy A82-20556

Design for military aircraft operability; Proceedings of the Symposium, London, England, February 7, 1980 A82-20560

Design for operability of military aircraft RAF engineering experience and requirements. I - Thoughts of a squadron engineer A82-20561

Aircraft operability - RAF engineering experience and requirements. II A82-20562

Operability of military aircraft - Avionic design aspects A82-20564

Operability of military aircraft - Some design and cost trends A82-20565

Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980 A82-20751

Test and evaluation of improved aircrew restraint systems [AD-A107576] N82-16056

Detection and prevention of corrosion in Royal Air Force aircraft N82-17351

MILITARY AVIATION

Assessment of historical and projected segments of US and World civil and military rotorcraft markets 1960 - 1990 [NASA-CR-166151] N82-17137

SURFACE COOLING
Impingement cooling of concave surfaces of turbine airfoils
A82-18894

SURFACE EFFECT SHIPS
Accidents of surface effect ships and hydrofoil craft --- Russian book
A82-18899

SURFACE NAVIGATION
Land navigation with a low cost GPS receiver
A82-20656

SURFACE ROUGHNESS EFFECTS
Survey on the effect of blade surface roughness on compressor performance
N82-17191

SWEPT FORWARD WINGS
On the track of practical forward-swept wings
A82-19071

SWEPT WINGS
Analysis of an ideal-fluid flow past a finite-thickness wing
A82-19813

SWEPTBACK WINGS
Some experimental investigations on transonic flutter characteristics of thin plate wing models with sweptback and tapered tips
[NAL-TR-682] N82-16050

SYNTHETIC FUELS
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[DE82-001127] N82-17401

SYSTEM EFFECTIVENESS
Experience with flight simulators - Training effectiveness-future developments
[DGLR PAPER 81-110] A82-19263
Calibrated and uncalibrated inertial navigation system performance in valid and jammed global positioning system environments
A82-21587
The Global Positioning System Evaluator --- facility for testing in simulated wide range environments
A82-21588

SYSTEMS ENGINEERING
A fuel control system designers approach to gas turbine engine computer model validation
A82-19253
A progress report on the European Transonic Wind Tunnel Project
[ONERA, TP NO. 1981-121] A82-19737
Systems approach to the design of wind shear avionics
A82-21593
Propulsion system controls design and simulation
[AIAA PAPER 82-0322] A82-22091
Research and technology annual report, 1981
[NASA-TM-81333] N82-17081

SYSTEMS INTEGRATION
Development of a digital integrated automatic landing system /DIALS/ for steep approach and landing
A82-20297
The FS2 RAE Bedford civil flight research programme --- on components and system integration for optimum ATC
A82-20519
The influence of technology advances on integrated CNI avionics --- Integrated Communication, Navigation, and Identification Avionics for military aircraft
A82-20672
Next generation military aircraft will require hierarchical/multilevel information transfer systems --- packet switching
N82-17114
Integrated control of mechanical system for future combat aircraft
N82-17117

SYSTEMS SIMULATION
Radar environment simulation for software test
A82-19245
Real-Time Simulation Computation System --- for digital flight simulation of research aircraft
A82-19260
The simulation study on a redundant flight control system
A82-22120
F/A-18 weapons system support facilities
N82-17120

T

TABLES (DATA)
BBC/Sulzer. 4 stage transonic compressor
N82-17197

TACAN
Terminal area automatic navigation, guidance, and control research using the Microwave Landing System (MLS). Part 3: A comparison of waypoint guidance algorithms for RNAV/MLS transition
[NASA-CR-3512] N82-16060

TAIL ASSEMBLIES
Resonance tests on a Piper PA-32R tailplane before and after damage
[AD-A106273] N82-16071
Experimental trim drag values for conventional and supercritical wings
[NASA-CR-168500] N82-17126

TARGET ACQUISITION
Tracking of low-altitude targets by a combined X/Ka-band radar system
A82-20590

TARGET RECOGNITION
Radiometric measurements at 80 GHz
A82-18943

TECHNOLOGICAL FORECASTING
We have just begun to create efficient transport aircraft
A82-21373
The outlook for advanced transport aircraft
A82-21374
Very high speed integrated circuits: Into the second generation. II - Entering Phase 1
A82-21848
Air service, airport access and future technology
[PB82-105958] N82-16100
Flight dynamics technology development: Structures and dynamics, vehicle equipment/subsystems, flight control and aeromechanics
[AD-A096636] N82-17082
Next generation military aircraft will require hierarchical/multilevel information transfer systems --- packet switching
N82-17114
Helicopter development in France
N82-17216

TECHNOLOGY ASSESSMENT
Broader bandwidth for thin conformal antennas
A82-19069
Sea based support aircraft alternatives
[AIAA PAPER 81-2649] A82-19217
Thrust management - Current achievements and future developments
A82-20520
The effects on simulators of advances in aircraft technology
A82-20533
The influence of technology advances on integrated CNI avionics --- Integrated Communication, Navigation, and Identification Avionics for military aircraft
A82-20672
Airbus Industrie - The year of progress
A82-21189
The outlook for advanced transport aircraft
A82-21374
CAD/CAM approach to improving industry productivity gathers momentum
A82-21375
Systems study of transport aircraft incorporating advanced aluminum alloys
[NASA-CR-165820] N82-17153
Technology overview for advanced aircraft armament system program
[AD-A107680] N82-17155
Summary of answers to the questionnaire
N82-17195

TECHNOLOGY TRANSFER
A perspective on civil use of GPS
A82-21589

TECHNOLOGY UTILIZATION
VTOL as it applies to resource development in the Canadian north
[AIAA PAPER 81-2640] A82-19215
Application of the ABC helicopter to the emergency medical service role
[AIAA PAPER 81-2653] A82-19219

Computer graphics for quality assurance
A82-20276

The application of strapdown inertial technology to Attitude and Heading Reference System requirements --- for YAH-64 advanced attack helicopter
A82-21590

TEMPERATURE CONTROL
Calculation of sensitivity derivatives in thermal problems by finite differences
A82-21391

TEMPERATURE DISTRIBUTION
Transient two-dimensional temperature distributions in air-cooled turbine blades
A82-18893

TEMPERATURE MEASUREMENT
A study of potentially low cost millimetre-wave radiometric sensors
A82-18942

Dilution jet behavior in the turn section of a reverse flow combustor
[AIAA PAPER 82-0192] A82-20291

TENSILE STRESS
Dispersion and temperature-force dependence of the high-temperature strength characteristics of a gas-turbine-engine disk alloy
A82-21636

TERMINAL BALLISTICS
Description of projectile threats
N82-17161

Analysis methods for predicting structural response to projectile impact
N82-17162

Analysis methods for ballistic damage size and type
N82-17163

Damage from High explosive (HE) projectiles
N82-17164

TERMINAL FACILITIES
New life for an 'old' body - Vienna's master plan for revitalization
A82-20172

TERMINAL GUIDANCE
A terminal guidance simulator for evaluation of millimeter wave seekers
A82-18937

Terminal area automatic navigation, guidance, and control research using the Microwave Landing System (MLS). Part 3: A comparison of waypoint guidance algorithms for RNAV/MLS transition
[NASA-CR-3512] N82-16060

An investigation of automatic guidance concepts to steer a VTOL aircraft to a small aviation facility ship
[NASA-CR-152407] N82-16087

TERRAIN
Terrain model animation
[AD-A107911] N82-17887

TERRAIN FOLLOWING AIRCRAFT
Automatic controlled terrain following flights
A82-18920

TEST CHAMBERS
Calibration of the Ames Anechoic Facility. Phase 1: Short range plan
[NASA-TM-84081] N82-16091

TEST EQUIPMENT
Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980
A82-20751

Development of a simple, self-contained flight test data acquisition system
A82-20756

Simulator data test instrumentation - Flight test challenge of the eighties
A82-20768

TEST FACILITIES
Sanctuary radar --- with digital processor for Doppler filtering and pulse compression
A82-18906

Helicopter icing spray system
A82-20754

The Boeing Flight Test Data System 1980
A82-20769

Instrumentation remote 'mini' ground station
A82-20770

The Global Positioning System Evaluator --- facility for testing in simulated wide range environments
A82-21588

Development and laboratory testing of a thermal emission velocimeter for application to an erosion nose tip test facility
[AD-A107713] N82-17482

THERMAL FATIGUE
Dispersion and temperature-force dependence of the high-temperature strength characteristics of a gas-turbine-engine disk alloy
A82-21636

THERMAL PROTECTION
Calculation of sensitivity derivatives in thermal problems by finite differences
A82-21391

THERMAL STABILITY
Deposit formation in liquid fuels. I - Effect of coal-derived Lewis bases on storage stability of Jet A turbine fuel
A82-22241

THERMAL STRESSES
Automated calculation of the stressed state of shell systems under asymmetrical mechanical and thermal loading
A82-19928

THERMODYNAMIC CYCLES
Aerodynamic components for small turboshaft engines
N82-17211

THERMODYNAMIC EFFICIENCY
The influence of new turbine technologies on their components
N82-17210

The distress regime on the bimotored helicopter
N82-17219

THERMOVISCOELASTICITY
Research and development program for non-linear structural modeling with advanced time-temperature dependent constitutive relationships
[NASA-CR-165533] N82-16080

THIN AIRFOILS
Pade approximation applied to flow past thin airfoils
A82-20728

THIN WALLED SHELLS
Automated calculation of the stressed state of shell systems under asymmetrical mechanical and thermal loading
A82-19928

Studies on the stability of thin-walled shells with cutouts /Review/. I
A82-21629

THIN WINGS
Some experimental investigations on transonic flutter characteristics of thin plate wing models with sweptback and tapered tips
[NAL-TR-682] N82-16050

THREAT EVALUATION
Threat perception while viewing single intruder conflicts on a cockpit display of traffic information
[NASA-TM-81341] N82-16076

THREE DIMENSIONAL BOUNDARY LAYER
Measurements of a three-dimensional boundary layer on a sharp cone at Mach 3
[AIAA PAPER 82-0289] A82-22083

THREE DIMENSIONAL FLOW
Three-dimensional calculation of the flow in helicopter air intakes
[ONERA, TP NO. 1981-124] A82-19740

Numerical solution of three-dimensional unsteady transonic flow over wings including inviscid/viscous interactions
[AIAA PAPER 82-0352] A82-19797

Flow visualization using a computerized data acquisition system
A82-20792

A split coefficient/locally monotonic scheme for multishocked supersonic flow
[AIAA PAPER 82-0287] A82-22082

Analytical study of twin-jet shielding development of a 3-dimensional model
[NASA-CR-165106] N82-16805

THRUST AUGMENTATION
Application of thrusting ejectors to tactical aircraft having vertical lift and short-field capability
[AIAA PAPER 81-2629] A82-19211

Performance flight test evaluation of the Ball-Bartoe JW-1 Jetwing STOL research aircraft
A82-20762

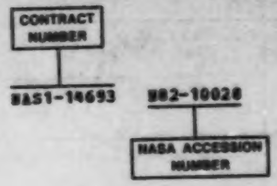
CONTRACT NUMBER INDEX

Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the *IAA* accession numbers appearing first. The accession number denotes the number by which the citation is identified in either the *IAA* or *STAR* section.

A82-23317 **International plans for civil and military coordination.** P. J. Gray (RAF, National Air Traffic Services, London, England). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 105-108.

Attention is given to a review of the common aims of the civil and military controller, certain conflicts of interest inherent in the function of civil and military air traffic control, and the resolution of conflicts related to the existence of national boundaries in Western Europe. In connection with the finite nature of air space, it is found to be important that, in an allocation of the utilization of this space, the needs and characteristics of all users, civil and military, must be taken into consideration. In the UK, integrated civil and military staffs at HQ and field levels are used to ensure that no one user interest is permitted to unfairly predominate. In the wider European context civil and military coordination and cooperation prevails within Eurocontrol, and perhaps most successfully, at NATO CEAC (Committee for European Airspace Coordination). G.R.

A82-23318 **Operational air traffic in the Federal Republic of Germany.** F.-W. von Schlichtkrull (Bundeswehr, Frankfurt am Main, West Germany). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 111-117.

Aspects of traffic volume are considered, taking into account the number of civil and military aircraft flights for 1979. For an appropriate evolution of the performance involved in controlling the total number of flights reported (3,950,000), the geographic size of the Federal Republic of Germany must be taken into account, giving attention also to regulations which exclude military aircraft from an area near the iron curtain border. Military operational air traffic can be divided into three categories, including uncontrolled military flights, military air traffic under the control of air defense units, and military air traffic handled by Air Traffic Services. The high air traffic density leads to special problems which are partly related to midair collision hazards. Approaches for solving these problems are discussed, taking into account a separation in space for flights of different traffic categories, and an employment of advanced control methods. G.R.

A82-23319 **Distributed data processing modeling for future ATC systems.** R. R. Jones (Hughes Aircraft Co., Fullerton, CA). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 125-131.

The use of distributed processing procedures makes it feasible to reduce the processor cost, and to increase, at the same time, maintainability and reliability. Other advantages are related to the convenience of system expansion by means of added capabilities. The utilization of distributed data processing benefits for air traffic control systems (ATC) is considered, taking into account the use of a rigorous analytic technique for a determination of optimal operational configurations. The analytic technique selected is simulation modeling. This approach makes use of a Distributed Data Processing Model (DDPM) coupled with a Design Analysis System (DAS). The considered approach has been employed extensively to design many complex systems similar in scope and nature to ATC systems. A description is presented of the DDPM and the DAS, giving attention to the use of these techniques in an application involving an ATC system. G.R.

A82-23320 **ATC automation - A look forward: Technology/architecture.** L. M. Reppert (Texas Instruments, Inc., Dallas, TX). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 133-136.

It is pointed out that ATC automation is going through a revolutionary evolution due to major technological advances in such areas as microprocessors and memories. A reasonable projection prediction for the 80's and 90's would specify a high utilization of distributive computer architecture implemented with simple/high technology hardware. The considered evolution will require a system which is functional-task oriented, repartitionable, and modular. Using distributed computer architecture and available microprocessor and memory technologies, ATC system designers can perform all the required functions and implement the system in a highly efficient and cost effective manner which inherently provides the desired characteristics, taking into account modularity, recoverability, high data integrity, ultra-high reliability, and computer-aided maintainability. G.R.

A82-23321 **Lightweight ATC systems.** R. Bonitch (Eaton Corp., AJL Div., Farmingdale, NY). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 139-144.

The problem of tactical ATC system implementation has been considered, taking into account the generation of light-weight and low-cost equipment which can provide advanced ATC capabilities for forward command posts, tactical command centers, and low traffic density applications, such as remote airfields and oil rigs. The considered systems are based on microprocessor technology. This technology makes it possible to utilize recent advances related to signal processing, antenna development, and plasma displays. Attention is given to the development of the Small Plasma Automated Radar Terminal Area Navigation System (SPARTAN) and its military version, the Very Lightweight Air Traffic Management Equipment (VLATME). The advantages of the employed ac plasma displays are related to light weight, low operating voltage (200 volts), and sustained memory. G.R.

A82-23322 **Discrete Address Beacon System /DABS/.** P. D. Hodgkins (FAA, Washington, DC). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 147-155.

In connection with the results of a study conducted in 1969, recommendations had been made to upgrade the Air Traffic Control System. These recommendations became the basic system requirements for DABS. The recommendations had been concerned with the development of three new systems, including an improved surveillance system for the eventual replacement of the present Secondary Surveillance Radar (SSR), a digital air/ground data link communication system, and a ground-based collision avoidance system. Probably the most significant characteristic of the DABS is that it is a direct extension of and fully compatible with the SSR or the ATC Radar Beacon System (ATCRBS), as it is referred to in the U.S. Although primarily a surveillance system, DABS is also a communications and ground-based collision avoidance system designed with sufficient capacity to accommodate expected air traffic growth well into the next century. G.R.

A82-23323 **A Microwave Landing System simulation.** R. P. Spengler and R. W. Zoladz (Computer Sciences Corp., Pomona, NJ). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings. Arlington, VA, Air Traffic Control Association, 1980, p. 157-162.

Computer software is being developed for a series of experiments involving the simulation of Microwave Landing System (MLS) operations. The purpose of these experiments is to identify, or at least obtain advanced warning of, potential problem areas in an MLS implementation. The MLS simulation model is divided into three phases. Each phase represents a different level of avionics and thus provides capabilities for different approach paths. Emphasis is placed on the ATC communications and the various approach geometries. The MLS is an air derived system in which ground based equipment transmits accurate approach information to a receiver on board the aircraft. Azimuth, elevation, and ranging elements comprise the system operating in the microwave band (approximately 5000 megahertz). With MLS, aircraft can enter the approach area from various directions and speeds and fly toward separate approach gates. G.R.

A82-23324 **Voice communications - The vital link.** R. E. Hustead (Litton Industries, Amecom Div., College Park, MD). In: Air Traffic Control Association, Annual Fall Conference, 25th, Arlington, VA, October 19-24, 1980, Proceedings.

Arlington, VA, Air Traffic Control Association, 1980, p. 165-168.

Voice communications provides the vital link among controllers and between controllers and aircrews. Communications systems presently in use provide voice communications via three links, including intercom (between different air traffic controllers), interphone (between different sites), and radio (between the air traffic controller and the pilots). It is pointed out that current communications systems at most air traffic control facilities are generally outdated, inflexible, and difficult to maintain. Attention is given to needs for a new voice communication system which is able to handle the peak loads of air traffic that the facility will encounter. Amecom's Integrated Voice Communications Systems satisfies these needs and is available now. The system has been designed specifically for the Air Traffic Control environment. Aspects of system operation are discussed in some detail. G.R.

A82-23368 **Fighters - Tomorrow's terminology.** G. Warwick. *Flight International*, vol. 121, Feb. 6, 1982, p. 291, 292, 301, 302.

Consideration is given to the technological features under study for integration into fighter aircraft designs over the course of the 1990s. These features include: (1) fly-by-wire and fly-by-light active electronic controls, which will permit the modification of flight characteristics through reprogramming of software control laws; (2) the use of primary, directional-reinforced composite structures that will aeroelastically deform in flight to increase aerodynamic efficiency; (3) the improvement of wing aerodynamics through the downstream effect of canards; (4) the use of conformal stores carriages to reduce drag by as much as 60%; (5) the generation of direct lift force control by means of coordinated wing/canard control surface actuation; and (6) the vectoring of engine exhaust nozzles to increase lift and maneuverability. O.C.

A82-23369 **Boeing's big, quiet 737-300.** B. Sweetman. *Flight International*, vol. 121, Feb. 13, 1982, p. 353-356.

A description is given of the modifications made on the precursor 737-200 commercial aircraft design to yield the 737-300, which include: (1) greater wing and horizontal stabilizer spans; (2) fuselage extensions totalling 104 in; (3) leading edge slat airfoil redesign; (4) the incorporation of adhesive bonding construction techniques and more advanced aluminum alloys for longer service life; and most importantly, (5) a new engine installation that will accomodate either CFM 56-3 or RJ-500 turbofans. The modified aircraft is expected to meet FAR 36 Stage 3 noise limits, and to be more fuel-efficient than its predecessor. In the context of the present commercial aircraft market, the 737-300 represents a transitional design which will be replaced by a novel, 150-passenger short-haul aircraft. O.C.

A82-23426 **Israel Annual Conference on Aviation and Astronautics, 23rd, Tel Aviv and Haifa, Israel, February 11, 12, 1981, Collection of Papers.** Conference supported by the Technion - Israel Institute of Technology, Israel Ministry of Defence, Ministry of Transport, et al. Haifa, Israel, Technion - Israel Institute of Technology, 1981. 251 p.

Topics significant to modern aircraft design and performance, design and efficiency, and to control logic were examined. Flow past an airfoil in a supersonic stream was discussed, as were drag reduction by means of an active boundary layer thickening, the aerodynamic characteristics of an axisymmetric configuration with transverse jets in the base plane, and coherent structure of the turbulent boundary layer in the lateral direction. A general similarity solution of the transonic equation in the physical plane was presented, and perturbations to unidirectional turbulent flow due to small lateral mean velocity gradients were studied. Discussions were devoted to the evaluation of stiffened shell characteristics from imperfection measurements, to fixed gain controller design for aircraft, and to a time finite element discretization of Hamilton's law. M.S.K.

A82-23439 # **Low grade fuels for turbo and jet engines.** B. Gal-Or, E. Zahavi, and A. Burcat (Technion - Israel Institute of Technology, Haifa, Israel). In: Israel Annual Conference on Aviation and Astronautics, 23rd, Tel Aviv and Haifa, Israel, February 11, 12, 1981, Collection of Papers. Haifa, Israel, Technion - Israel Institute of Technology, 1981, p. 170-180.

In connection with the energy crisis, a program has been initiated to reexamine the design methodologies and the expected performance characteristics of turbo and jet engines in the light of the higher temperatures and reduced durability that would result from the increasing use of low-grade, high-aromatic aircraft fuels. The discussion focuses on the first phase of the program which includes simulated computer studies of the maximum flame temperatures exptected in jet engine combustors with different fuels under various operating conditions such as takeoff, cruise, and idle performance at various altitudes and Mach numbers. General parameters are proposed for the comparison of alternative fuels in terms of the maximum flame temperatures and the combustion products distributions. V.L.

A82-23441 # **Fixed gain controller design for aircraft.** Y. Baram and D. Eidelman (Tel Aviv University, Tel Aviv, Israel). In: Israel Annual Conference on Aviation and Astronautics, 23rd, Tel Aviv and Haifa, Israel, February 11, 12, 1981, Collection of Papers, Haifa, Israel, Technion - Israel Institute of Technology, 1981, p. 211-216. 6 refs. Grant No. AF-AFOSR-80-0178.

A method for designing fixed-gain controllers for systems with large parameter variation is presented, with particular attention to the problem of designing non-adaptive back-up control systems for high performance aircraft. The approach, based on minmax information criteria, is used to design a fixed-gain controller and a state estimator for a given aircraft, and is shown to provide good performance qualities. (Author)

A82-23444 **YF-16 design concept and philosophy.** H. J. Hillaker (General Dynamics Corp., Fort Worth, TX). *(Israel Annual Conference on Aviation and Astronautics, 23rd, Tel Aviv and Haifa, Israel, Feb. 11, 12, 1981.) Israel Journal of Technology*, vol. 19, no. 1-2, 1981, p. 3-18.

The design objective of the original YF-16 was to maximize the usable maneuverability and agility of the aircraft in the air combat arena at a mission radius of 500 n.mi. This objective was to be achieved within a flyaway cost of 3 million dollars per unit. To this end, emphasis was placed on small size and low weight/cost, on advanced technologies, and on design/aerodynamic innovations. The key configuration elements that offered clear superiority in terms of maximum lift, directional stability, drag-at-lift, and inlet flow field were bottom inlet, wing-body blending, variable camber, and single vertical tail. New wing planforms which are being tested on F-16, will allow even greater capabilities while retaining the low-cost concept. A single turbofan engine provides the best balance of combat capability and mission radius for the lowest weight. V.L.

A82-23470 **Improvement of fuel economy by flying with maximum rearward center-of-gravity positioning (Verbesserung der Treibstoffökonomie durch Fliegen mit zulässiger rückwärtiger Schwerpunktlage).** M. Caspari and D. Kricke (Gesellschaft für Internationalen Flugverkehr mbH, Berlin, East Germany). *Technisch-ökonomische Information der Zivilen Luftfahrt*, vol. 17, no. 3, 1981, p. 142-146. In German.

The relationship between balance, stability, and maneuverability is established, and means of minimizing the moment of an aircraft's horizontal stabilizers and elevators to conserve energy are discussed. Requirements and peculiarities of INTERFLUG aircraft are described, and current techniques to save fuel by achieving a higher rearward center-of-gravity positioning are discussed. Particular attention is given to the retention of rearward center-of-gravity positioning in the IL-62/IL-62M aircraft. Calculations show that procedures exist to achieve a rearward center-of-gravity positioning of 33%, which would result in a minimum fuel savings of 4.1% at 165 g/km. J.F.

A82-23603 **High-frequency monitoring of surface layers of metals.** A. L. Dorofeev, N. P. Kalinin, and V. D. Ostapenko (Kalinin Carburetor Plant, Perm, USSR). *(Defektoskopiia*, Apr. 1981, p. 34-40.) *Soviet Journal of Nondestructive Testing*, vol. 17, no. 4, Dec. 1981, p. 268-272. Translation.

A high-performance electromagnetic device working at 100-500

A82-24412 **LAMPS III recovery assist, securing and traversing /RAST/ system.** F. Cracknell (DAF Indal, Ltd., Mississauga, Ontario, Canada). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811080.* 9 p.

The main portions of the RAST system are outlined, with descriptions given of their functions. Some of the ground and flight test experience gained thus far is summarized. The system is shown to meet the requirements of the Light Airborne Multi Purpose System (LAMPS). This latter system depends for its success upon the ability to operate helicopters safely and reliably under weather conditions where the ship roll angles reach about 30 deg and the wave heights reach 13 feet. C.R.

A82-24413 **The use of 'Kapton' polyimide film in aerospace applications.** D. H. Berkebile and D. L. Stevenson (Du Pont de Nemours and Co., Wilmington, DE). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811091.* 9 p.

The principal steps involved in the manufacture of wire and cable insulated with 'Kapton' are described. The latest shop handling techniques are reviewed, among them automated stripping and high-speed marking. Additional aerospace applications in avionics and insulation blankets are discussed. Tables summarizing the performance characteristics of wire insulated with this polyimide film are included. C.R.

A82-24415 **Fighter issues - 2000.** D. R. Kozlowski (McDonnel Douglas Corp., St. Louis, MO). *Society of Automotive Engineers, Aerospace Congress and Exposition, Anaheim, CA, Oct. 5-8, 1981, Paper 811096.* 13 p. 6 refs.

Consideration is given to the design requirements formulated for an advanced tactical fighter (ATF) that will operate in the electronic warfare and nuclear/biological/chemical warfare scenarios anticipated for the year 2000. The performance requirements may be characterized as speed, stealth and STOL (SSS). The SSS criteria have nominal values of (1) Mach 1.8 sustained supersonic speed, with Mach 2.5 as maximum for intercept and chase, (2) less than 0.5 sq m radar cross section, reduction of IR signature and engine exhaust contrail, and electromagnetic emission control, and (3) 1500 feet total required runway length. Attention is given to the problems posed by maintainability and cost-control criteria, as well as the emerging characteristics of air-to-air combat in view of the technological developments expected from potential adversaries. O.C.

A82-24416 **Annual review of fluid mechanics. Volume 14.** Edited by M. Van Dyke (Stanford University, Stanford, CA), J. V. Wehausen (California, University, Berkeley, CA), and J. L. Lumley (Cornell University, Ithaca, NY). Palo Alto, CA, Annual Reviews, Inc., 1982. 463 p. $22.

Applications of fluid mechanics are discussed for the study of strongly nonlinear waves, the topology of three-dimensional separated flows, and the mathematical theory of frontogenesis. Attention is also given to turbulent jets and plumes, gravity currents in the laboratory, atmosphere, and ocean, and to low-gravity fluid flows, specifically for convective flows. The computation of transonic potential flows is considered, as are the strange attractor theory of turbulence, numerical methods in free-surface flows, and the fluid dynamics of heart valves. M.S.K.

A82-24426 **International Conference on Numerical Methods in Fluid Dynamics, 7th, Stanford University, Stanford and Moffett Field, CA, June 23-27, 1980, Proceedings.** Conference supported by NSF, U.S. Air Force, and U.S. Navy. Edited by W. C. Reynolds (Stanford University, Stanford, CA) and R. W. MacCormack (NASA, Ames Research Center, Moffett Field, CA). Berlin and New York, Springer-Verlag (Lecture Notes in Physics. Volume 141), 1981. 493 p. $28.

Topics discussed include polygon transformations in fluid mechanics, computation of three-dimensional horseshoe vortex flow using the Navier-Stokes equations, an improved surface velocity method for transonic finite-volume solutions, transonic flow calculations with higher order finite elements, the numerical calculation of transonic axial turbomachinery flows, and the simultaneous solutions of inviscid flow and boundary layer at transonic speeds. Also considered are analytical solutions for the reflection of unsteady shock waves and relevant numerical tests, reformulation of the method of characteristics for multidimensional flows, direct numerical simulations of turbulent shear flows, the stability and separation of freely interacting boundary layers, computational models of convective motions at fluid interfaces, viscous transonic flow over airfoils, and mixed spectral/finite difference approximations for slightly viscous flows. B.J.

A82-24562 # **On-line control for the regulation of power source in multiple-servo electro-hydraulic systems.** B. N. Suresh (Indian Space Research Organization, Vikram Sarabhai Space Centre, Trivandrum, India), W. L. Green, and D. J. Sanger (Salford, University, Salford, Lancs., England). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/DSC-3.* 8 p. 8 refs. Members, $2.00; nonmembers, $4.00.

The efficiency of a multiple-servo electrohydraulic system, in which power can be reduced by means of an on-line self-optimizing control, depends on the selection of the most suitable among five search strategies. The strategies are considered in light of a hydraulic system mathematical model employing two velocity servos whose individual performance is simulated on a computer. Simulation results show that the Simplex is the most useful strategy for on-line implementation in a practical system, where the implementation scheme involves no more than six variables. O.C.

A82-24563 * # **Wide field of view laser beacon system for three-dimensional aircraft position measurement.** L. M. Sweet, R. B. Miles, S. G. Webb, and E. Y. Wong (Princeton University, Princeton, NJ). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/DSC-9.* 9 p. 8 refs. Members, $2.00; nonmembers, $4.00. Grant No. NCC2-94.

This paper presents a new wide field of view laser beacon system for measurement, in three dimensions, of aircraft or other remote objects. The system is developed for aircraft collision hazard warning independent of ground-based hardware, as well as for flight research, helicopter-assisted construction and rescue, and robotic manipulation applications. Accurate information describing the relative range, elevation, and azimuth of the aircraft are generated by the sweep of a low-power fan-shaped rotating laser beacon past an array of optical detectors. The system achieves a wide angle of acceptance of laser beacon light through use of compound parabolic concentrators, which collimate the light for spectral filtering to minimize solar interference. An on-board microprocessor system converts the pulse sequence to aircraft position in real time. System reliability and performance are enhanced through narrow pass filtering of the pulse signals, digital logic design to mask spurious signals, and adaptive modulation of trigger threshold levels. (Author)

A82-24565 # **Describing function analysis of nonlinear nose gear shimmy.** T. D. Burton (Washington State University, Pullman, WA). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/DSC-20.* 9 p. 10 refs. Members, $2.00; nonmembers, $4.00. Research sponsored by the Boeing Military Airplane Co.

The design of shimmy free nose landing gear is complicated by the action of the gear hydraulic steering system. During shimmy the steering system pressure response results in loads on the gear which are highly nonlinear functions of geat motion. In order to obviate the need for extensive numerical work to analyze geat stability, the describing function method has been used to linearize the steering system response, enabling the stability to be analyzed using linear system techniques. Application of this approach to a representative nose gear/steering system showed the limit cycle amplitudes and stability boundaries of the shimmy motion to be in good agreement with results obtained numerically; the transient response was also predicted reasonably well. (Author)

A82-24566 # **Complete velocity profile and 'optimum' skin friction formulas for the plane wall-jet.** G. P. Hammond (Cranfield Institute of Technology, Cranfield, Beds., England). *American Society of Mechanical Engineers, Winter Annual Meeting, Washing-*

ton, DC, Nov. 15-20, 1981, Paper 81-WA/FE-3. 7 p. 30 refs. Members, $2.00; nonmembers, $4.00. Science Research Council Grants No. B/RG/98590; No. GR/A/44312.

An analytic expression for the complete velocity profile of a plane, turbulent wall-jet in 'stagnant' surroundings is obtained by coupling Spalding's single formula for the inner layer with a sine function for the 'wake component'. This expression is transformed at the velocity maxima to yield an 'optimum log-law' for skin friction. An approximate skin friction formula based on the 'initial conditions' of the wall-jet is also presented. The formulas are generally in good agreement with experimental data. The complete velocity profile does not exhibit the conventional 'law of the wall' behavior and modifications are consequently recommended to the usual treatment of the near-wall region in numerical calculation procedures for wall-jet flows. The use of the 'Clauser plot' method of skin friction measurement is similarly shown to be in error when applied to wall-jets. (Author)

A82-24602 * # **Influence of exit impedance on finite difference solutions of transient acoustic mode propagation in ducts.** K. J. Baumeister (NASA, Lewis Research Center, Cleveland, OH). *American Society of Mechanical Engineers, Winter Annual Meeting, Washington, DC, Nov. 15-20, 1981, Paper 81-WA/NCA-13.* 8 p. 24 refs. Members, $2.00; nonmembers, $4.00.

The cutoff mode instability problem associated with a transient finite difference solution to the wave equation is explained. The steady-state impedance boundary condition is found to produce acoustic reflections during the initial transient, which cause finite instabilities in the cutoff modes. The stability problem is resolved by extending the duct length to prevent transient reflections. Numerical calculations are presented at forcing frequencies above, below, and nearly at the cutoff frequency, and exit impedance models are presented for use in the practical design of turbofan inlets. D.L.G.

A82-24643 **Institute of Navigation, Annual Meeting, 37th, U.S. Naval Academy, Annapolis, MD, June 9-11, 1981, Proceedings.** Washington, DC, Institute of Navigation, 1981. 171 p. Members, $30.; nonmembers, $35.

The performance of a ring laser strapdown marine gyrocompass is considered along with a brief history of the use of marine radar, a marine NAVSTAR GPS receiver, the application of NAVSTAR differential GPS in the civilian community, the applications of a multiplexed GPS user set, and initial FAA tests on the NAVSTAR GPS Z-set. Attention is given to the Federal Radionavigation Plan, scanning strategies for Air Traffic Control radars, the View-Nav system, operational and economic benefits deriving from use of loran-C RNAV, loran-C RNAV in mountainous areas, and an analysis of loran-C system reliability for civil aviation. A description is presented of a strapdown configured land navigation system, aspects of marine simulation, bridge simulation, and an empirical INS difference monitoring procedure used to sequence SSBN NAVAID fixes. G.R.

A82-24644 # **A marine NAVSTAR GPS receiver.** R. E. Maine (Sperry Corp., Sperry Marine Systems, Charlottesville, VA). In: Institute of Navigation, Annual Meeting, 37th, Annapolis, MD, June 9-11, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 54-59.

Attention is given to the design philosophy, construction, programming, testing, and test results of a simplified NAVSTAR Global Positioning System (GPS) receiver for marine applications. The GPS signals are received by an omnidirectional antenna, filtered to reduce out-of-band signal levels, amplified by a low noise preamplifier, and transmitted through a coaxial cable to the interior equipment. The technique used is to stop the code clock as precisely as possible at the occurrence of a timing mark. The GPS front end is considered along with the signal amplitude interface, the receiver gain control, the microcomputer, the phase shift interface, the pseudorandom noise code generator, and a real-time flow chart. A breadboard receiver constructed as described, using largely off-the-shelf components, has been found to acquire and track the experimental satellites quite successfully. G.R.

A82-24645 * # **The application of NAVSTAR differential GPS in the civilian community.** J. Beser and B. W. Parkinson (Intermetrics, Inc., Huntington Beach, CA). In: Institute of Navigation, Annual Meeting, 37th, Annapolis, MD, June 9-11, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 60-74. 11 refs. NASA-sponsored research.

The NAVSTAR Global Positioning System (GPS), currently being developed by the DOD, is a space based navigation system that will provide the user with precise position, velocity, and time information on a 24 hour basis, in all weather conditions and at any point on the globe. The baseline GPS system will provide guaranteed high accuracy to only a limited number of users, mostly the military. The civilian community has to devise a variation of this system to allow for an assured, uninterrupted level of accuracy. Differential GPS provides such a capability. In connection with the conceived possibility of the use of GPS by an enemy, it is found to be necessary to implement a selective availability technical capability. Differential GPS provides an approach for the civilian community to have a guaranteed level of accuracy better than the 260 meters presently planned for GPS. G.R.

A82-24646 # **Scanning strategies for air traffic control radars.** P. R. Mahapatra and D. S. Zrnic (NOAA, National Severe Storms Laboratory, Norman, OK). In: Institute of Navigation, Annual Meeting, 37th, Annapolis, MD, June 9-11, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 100-105. 14 refs. U.S. Department of Transportation Contract No. FA01-80-1-Y-10524.

In connection with a history of weather-related air traffic accidents near terminal areas, it is desirable that air traffic control (ATC) radars possess the capability to detect and identify elements of weather which are hazardous to aviation. To possess the capability of hazardous weather detection in a reliable manner, a radar must employ a scan strategy such that the scan cycle is not so slow as to miss shortlived for fast-growing weather phenomena. The separation of the elevation levels of the scan cycle must be close enough to ensure the detection of storm features which may endanger air traffic. Attention is given to a study conducted to determine the most suitable scanning techniques for ATC radars, taking into account the data base for the study, the photo-interpretation of the multimoment data, the vertical spacing of scan levels, and an investigation of the lifetime of an atmospheric feature by spatial correlation. G.R.

A82-24647 # **Beyond the horizon coverage for air navigation/traffic control.** V. I. Weihe. In: Institute of Navigation, Annual Meeting, 37th, Annapolis, MD, June 9-11, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 106-110. 11 refs.

An important segment of the aircraft population is engaged in routine flights under instrument flight rule conditions at low altitudes beneath and beyond the coverage of the current land-based air traffic control (ATC) aids. If the ATC system were expanded so that it readily accommodated low flying aircraft, many pilots would take advantage of the increased safety thereby made available. Attention is given to the available technical options, the Aring Communication Addressing and Reporting System (ACARS), the addition of airborne nodes to common carrier communications networks, and ATC ground communications network radio link interface subsystems. Approaches suitable for the Gulf of Mexico systems are also considered. G.R.

A82-24648 # **Loran for precise position location - The VIEW-NAV system.** M. Rogoff and P. M. Winkler (Emory University, Atlanta, GA). In: Institute of Navigation, Annual Meeting, 37th, Annapolis, MD, June 9-11, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 111-113.

The VIEW-NAV system consists of a loran receiver which is connected to a digital computer and visual display. The onboard computer is a small rugged and reliable digital processor. Aspects of system operation are discussed, taking into account the calibration of the loran grid and the monitoring of the grid. A description of system performance is also provided, giving attention to a number of tests which have been conducted in Long Island Sound and Chesapeake Bay. When a monitor is employed, errors of as little as a few yards are observed. To obtain reliable and accurate results in critical locations, monitors should be employed in such places. G.R.

Propulsion system controls design and simulation [AIAA PAPER 82-0322] A82-22091

ENGINE DESIGN
A fuel control system designers approach to gas turbine engine computer model validation A82-19253
Development of a correlated finite element dynamic model of a complete aero engine [ASME PAPER 81-DET-74] A82-19326
A CAD/CAM graphics system with relative datums and tolerances [ASME PAPER 81-DET-108] A82-19333
The impact of increasing energy costs upon the design philosophy of avionic fuel management systems A82-20517
Advanced subsonic transport propulsion [AIAA PAPER 81-0811] A82-20874
ALF502 - Plugging the turbofan gap A82-21243
Influence of correlations and computational methods on the prediction of overall efficiency N82-17180
Helicopter Propulsion Systems [AGARD-CP-302] N82-17203
The influence of new turbine technologies on their components N82-17210
Aerodynamic components for small turboshaft engines N82-17211
Evaluation of the design, construction and operation of a gas fueled engine driven heat pump [ERG-034] N82-17459
Scientific report of the Fluid Mechanics Research Department N82-17469

ENGINE FAILURE
Process monitor helps make jet engines reliable A82-21897
Damage from engine debris projectiles N82-17165

ENGINE INLETS
Three-dimensional calculation of the flow in helicopter air intakes [ONERA, TP NO. 1981-124] A82-19740
Prediction of sound radiation from different practical jet engine inlets [NASA-CR-165120] N82-16810

ENGINE MONITORING INSTRUMENTS
Process monitor helps make jet engines reliable A82-21897
An alternative approach to engineering structures using monitoring systems N82-17223

ENGINE NOISE
Multiple pure tone elimination strut assembly --- air breathing engines [NASA-CASE-FRC-11062-1] N82-16800
Analytical study of twin-jet shielding [NASA-CR-165102] N82-16801
Analytical study of twin-jet shielding [NASA-CR-165103] N82-16802
Analytical study of twin-jet shielding [NASA-CR-165104] N82-16803
Analytical study of twin-jet shielding [NASA-CR-165105] N82-16804
Analytical study of twin-jet shielding development of a 3-dimensional model [NASA-CR-165106] N82-16805
Analytical study of twin-jet shielding two-dimensional model [NASA-CR-165107] N82-16806

ENGINE PARTS
Helicopter Propulsion Systems [AGARD-CP-302] N82-17203
Mechanical advances in the design of small turboshaft engines N82-17208
Advanced component development design basis for next generation medium power helicopter engines N82-17209
Aerodynamic components for small turboshaft engines N82-17211

ENGINE STARTERS
Maintenance posture for quick start [AD-A107553] N82-17177

ENGINE TESTS
Development of the automated AFAPL engine simulator test for lubricant evaluation [AD-A106128] N82-16093
Development test programs adapted to helicopter engines N82-17205

ENVIRONMENT SIMULATION
Radar environment simulation for software test A82-19245
Helicopter icing spray system A82-20754

ENVIRONMENTAL TESTS
The Global Positioning System Evaluator --- facility for testing in simulated wide range environments A82-21588
Environmental exposure effects on composite materials for commercial aircraft [NASA-CR-3502] N82-16178
Forecasting corrosion damage and maintenance costs for large aircraft N82-17357

EQUATIONS OF MOTION
An analytical technique for the analysis of airplane spin entry and recovery [AIAA PAPER 82-0243] A82-19786

EQUIPMENT SPECIFICATIONS
Advanced recorder design and development [PB81-244105] N82-16385

ERROR ANALYSIS
Methodology for measurement of fault latency in a digital avionic miniprocessor N82-17105

ERROR DETECTION CODES
Methodology for measurement of fault latency in a digital avionic miniprocessor N82-17105

ESTIMATING
Comparison of various elevation angle estimation techniques A82-20589

EUROPEAN AIRBUS
Airbus Industrie - The year of progress A82-21189

EVACUATING (TRANSPORTATION)
Aeromedical evacuation: Results, analysis, developments; International Aeromedical Evacuation Congress, 1st, Munich, West Germany, September 16-19, 1980, Reports A82-19001
The marketing, organisation and financing of aeromedical evacuation by a motoring organisation A82-19002
Survey of aeromedical evacuation in Italy A82-19003
The network of civilian air rescue in Germany A82-19004
Ambulance helicopter in the Stockholm archipelago A82-19005
Military assistance to safety and traffic /MAST/ A82-19006
Aerial ambulance service in Australia A82-19007
Flying doctor service in East Africa A82-19008
Air ambulance systems in the Republic of South Africa A82-19009
The situation of air rescue in Argentina A82-19010
Aeromedical evacuation in New Zealand A82-19011
Problems pertaining to aeronautical technology in the case of rescue operations with helicopters in mountainous areas A82-19018

The helicopter in rescue operations in high-mountain areas
A82-19019

Aircraft for secondary long range emergency ambulance flight
A82-19021

EVALUATION
Investigation and evaluation of a computer program to minimize three-dimensional flight time tracks
[NASA-CR-160419] N82-17079

EXHAUST EMISSION
Analysis of flight test measurements in ground effect
A82-20763

EXPLOSIONS
Strength degradation of impact damaged structure
N82-17169

EXPLOSIVE DEVICES
Damage from High explosive (HE) projectiles
N82-17164

EXTERNAL STORE SEPARATION
Store separation from cavities at supersonic flight speeds
[AIAA PAPER 82-0372] A82-22096

EXTERNAL STORES
Technology overview for advanced aircraft armament system program
[AD-A107680] N82-17155

Standardization study for advanced aircraft armament system program
[AD-A107681] N82-17156

EXTREMELY HIGH FREQUENCIES
Tracking of low-altitude targets by a combined X/Ka-band radar system
A82-20590

EYE DISEASES
The prevalence of visual deficiencies among 1979 general aviation accident airmen
[AD-A106489] N82-16054

F

F-5 AIRCRAFT
Some observations on the corrosion of aircraft at the air force base in Bandirma, Turkey
N82-17353

On the Corrosion problems of the TAF F-5 aircraft
N82-17354

F-8 AIRCRAFT
Piloted simulation of an on-board trajectory optimization algorithm
A82-20296

F-15 AIRCRAFT
Data systems organization - A change for the better --- flight test data acquisition
A82-20767

F-16 AIRCRAFT
F-16 ground and inflight icing testing
A82-20753

F-18 AIRCRAFT
Initial F-18 carrier suitability testing
A82-20752

Size reduction flight test airborne data systems
A82-20766

F/A-18A tactical airborne computational subsystem
N82-17119

F/A-18 weapons system support facilities
N82-17120

F-27 AIRCRAFT
Aircraft for secondary long range emergency ambulance flight
A82-19021

FABRICATION
A CAD/CAM graphics system with relative datums and tolerances
[ASME PAPER 81-DET-108] A82-19333

Fabrication of boron/aluminum fan blades for SCR engines
[NASA-CR-165294] N82-16176

FAIL-SAFE SYSTEMS
The simulation study on a redundant flight control system
A82-22120

FAILURE MODES
Lubrication breakdown between gear teeth
N82-17213

Corrosion in naval aircraft electronic systems
N82-17363

FAN BLADES
Fabrication of boron/aluminum fan blades for SCR engines
[NASA-CR-165294] N82-16176

FAR ULTRAVIOLET RADIATION
Test and evaluation of UV fiber optics for application for aircraft fire detector systems
[AD-A106129] N82-16050

FASTENERS
Improving composite bolted joint efficiency by laminate tailoring
A82-20982

Flight-by-flight corrosion fatigue tests
N82-17348

FATIGUE (MATERIALS)
Effects of cyclic loading on projectile impact damage
N82-17167

Corrosion Fatigue --- conferences
[AGARD-CP-316] N82-17342

Mechanisms of corrosion fatigue --- of high strength aluminum alloys
N82-17343

Fracture mechanics based modelling of the corrosion fatigue process
N82-17344

Flight-by-flight corrosion fatigue tests
N82-17348

Corrosion prevention measures used in the construction of an aircraft airframe: The case of 2014 and 2214 alloys
N82-17360

Loading cycles and material data for the layout of a wind turbine of special hub concept
[ISD-273] N82-17643

FATIGUE LIFE
Random spectrum fatigue crack life predictions with or without considering load interactions
A82-20512

Bolted field repair of graphite/epoxy wing skin laminates
A82-20981

FATIGUE TESTS
Fatigue behavior of selected non-woven fiber composites for helicopter rotor blades
A82-20524

Process monitor helps make jet engines reliable
A82-21897

FAULT TOLERANCE
Hierarchical specification of the SIFT fault tolerant flight control system
N82-17106

SIFT: An ultra-reliable avionic computing system
N82-17115

FEED SYSTEMS
Helicopter air inlets
N82-17217

FEEDBACK CONTROL
An application of total synthesis to robust coupled design --- turbojet engine control
A82-19061

The use of adaptive control for helicopter trajectories in search operations
A82-19065

A program to evaluate a control system based on feedback of aerodynamic pressure differentials
[NASA-CR-163466] N82-16089

FEEDERS
QOT and E of the F-16 20mm ammunition loading system's ability to upload/download A-7D aircraft
[AD-A108007] N82-16099

FIBER COMPOSITES
Fabrication of boron/aluminum fan blades for SCR engines
[NASA-CR-165294] N82-16176

FIBER OPTICS
Test and evaluation of UV fiber optics for application for aircraft fire detector systems
[AD-A106129] N82-16050

FIBER ORIENTATION
Fatigue behavior of selected non-woven fiber composites for helicopter rotor blades
A82-20524

FIBER REINFORCED COMPOSITES
Composite structural materials --- fiber reinforced composites for aircraft structures
[NASA-CR-165121] N82-16182

MILITARY HELICOPTERS
  Military assistance to safety and traffic /MAST/ A82-19006
  ASW and weapon system simulation with reference to the Nimrod MR Mk2 maritime crew trainer A82-20531
  The armed helicopter in air to air missions [MBB-UD-317-81-O] N82-17158
  Development test programs adapted to helicopter engines N82-17205
MILITARY OPERATIONS
  Design Criteria of the A 129 helicopter drive system N82-17215
  Future requirements for helicopter propulsion systems N82-17225
MILITARY TECHNOLOGY
  Recent developments in military telemetry A82-18908
MILLIMETER WAVES
  A study of potentially low cost millimetre-wave radiometric sensors A82-18942
  Tracking of low-altitude targets by a combined X/Ka-band radar system A82-20590
MINERAL OILS
  A history of aircraft piston engine lubricants A82-19622
MINES (EXCAVATIONS)
  Study of air compressor hazards in underground and surface mines [PB82-105164] N82-17597
MINICOMPUTERS
  Current pressure measuring system in the transonic wind tunnel [AD-A106272] N82-16096
  A versatile data acquisition system for a low speed wind tunnel [AD-A106269] N82-16097
  Methodology for measurement of fault latency in a digital avionic miniprocessor N82-17105
MISS DISTANCE
  Design criteria for a miss distance radar A82-18904
MISSILE CONFIGURATIONS
  Store separation from cavities at supersonic flight speeds [AIAA PAPER 82-0372] A82-22096
MISSILE CONTROL
  Microwave systems for radar guided missiles A82-18936
  A terminal guidance simulator for evaluation of millimeter wave seekers A82-18937
  Subsonic and transonic roll damping measurements on Basic Finner --- finned missile calibration model A82-19958
  Modelling of target radar scattering with application to guidance simulation A82-20570
  Store separation from cavities at supersonic flight speeds [AIAA PAPER 82-0372] A82-22096
MISSILE TRAJECTORIES
  Design criteria for a miss distance radar A82-18904
MODULES
  Function specifications for the A-7E Function Driver module [AD-A107922] N82-17173
MOLDING MATERIALS
  Transparent polyolefin film armor [AD-A107562] N82-17377
MOLDS
  Transparent polyolefin film armor [AD-A107562] N82-17377
MOORING
  Study of ground handling characteristics of a maritime patrol airship [NASA-CR-166253] N82-16090
MOTION PERCEPTION
  Cost efficiency versus objective fidelity in flight simulation [DGLR PAPER 81-104] A82-19264
MOTION PICTURES
  Terrain model animation [AD-A107911] N82-17887
MOVING TARGET INDICATORS
  Airport radar systems --- Russian book A82-18975
MRCA AIRCRAFT
  Requirements regarding digital external view systems for full mission flight and tactics simulators [DGLR PAPER 81-100] A82-19267
  Tornado-avionic development testing A82-20760
MULTIPATH TRANSMISSION
  Comparison of various elevation angle estimation techniques A82-20589
  An analysis of antijam communication requirements in fading media A82-20695
MULTIPLEXING
  F/A-18A tactical airborne computational subsystem N82-17119
MULTIPROCESSING (COMPUTERS)
  Tactical Airborne Distributed Computing and Networks [AGARD-CP-303] N82-17086

N

NACELLES
  Low speed testing of the inlets designed for a tandem-fan V/STOL nacelle [AIAA PAPER 81-2627] A82-19210
  Isolated nacelle performance - Measurement and simulation [AIAA PAPER 82-0134] A82-22054
  Test and evaluation of UV fiber optics for application for aircraft fire detector systems [AD-A106129] N82-16850
NASA PROGRAMS
  Research and technology annual report, 1981 [NASA-TM-81333] N82-17081
NATURAL GAS
  Evaluation of the design, construction and operation of a gas fueled engine driven heat pump [ERG-034] N82-17459
NAVIER-STOKES EQUATION
  Blade-to-blade computations and boundary layer corrections in axial compressors and turbines N82-17202
NAVIGATION AIDS
  System for providing an integrated display of instantaneous information relative to aircraft attitude, heading, altitude, and horizontal situation [NASA-CASE-FRC-11005-1] N82-16075
  Terminal area automatic navigation, guidance, and control research using the Microwave Landing System (MLS). Part 2: RNAV/MLS transition problems for aircraft [NASA-CR-3511] N82-17142
  Aeronautical Information Data Subsystem (AIDS): A ground-based component of air navigation services systems N82-17150
NAVSTAR SATELLITES
  NAVSTAR global positioning systems A82-20601
  Land navigation with a low cost GPS receiver A82-20656
  A perspective on civil use of GPS A82-21589
  Helicopters and Navstar/GPS A82-21592
NAVY
  Initial F-18 carrier suitability testing A82-20752
NETWORK CONTROL
  A reconfigurable change network for distributed process control N82-17108
NETWORK SYNTHESIS
  Aircraft electrical equipment - Design and operation --- Russian book A82-18998
  Power system design optimization using Lagrange multiplier techniques A82-20743

NEUROLOGY
Helicopter secondary applications for neurotraumatic emergencies A82-19015

NEVADA
Noise impact on communities from aircraft [GPO-80-617] N82-17655

NICKEL ALLOYS
Dispersion and temperature-force dependence of the high-temperature strength characteristics of a gas-turbine-engine disk alloy A82-21636

NIGHT FLIGHTS (AIRCRAFT)
Helicopters - Night operations A82-19017

NITROGEN COMPOUNDS
Deposit formation in liquid fuels. II - The effect of selected compounds on the storage stability of Jet A turbine fuel A82-22240

NOISE INTENSITY
Comparison of aircraft and ground vehicle noise levels in front and backyards of residences A82-20058

NOISE MEASUREMENT
Ground reflection effects in aircraft noise measurements A82-19970
Noise of the SR-3 propeller model at 2 deg and 4 deg angle of attack [NASA-TM-82738] N82-16808

NOISE POLLUTION
Noise impact on communities from aircraft [GPO-80-617] N82-17655

NOISE PREDICTION
Pressure dependence of jet noise and silencing of blow-offs A82-20266

NOISE PREDICTION (AIRCRAFT)
Analytical prediction of aerospace vehicle vibration environments [ASME PAPER 81-DET-29] A82-19305
Prediction of aircraft interior noise using the statistical energy analysis method [ASME PAPER 81-DET-102] A82-19332
A comprehensive flight test flyover noise program A82-20765
Can low-speed jet noise be predicted A82-22222
Turboprop cargo aircraft systems study [NASA-CR-165813] N82-16070
A shock wave approach to the noise of supersonic propellers [NASA-TM-82752] N82-16809

NOISE PROPAGATION
Prediction of aircraft interior noise using the statistical energy analysis method [ASME PAPER 81-DET-102] A82-19332
Helicopter propulsions systems. 1: Vibration prevention systems on helicopters 2: Problem of noise in the cabin N82-17222

NOISE REDUCTION
Sanctuary radar --- with digital processor for Doppler filtering and pulse compression A82-18906
Design requirements for modern rescue helicopters A82-19020
Comparison of aircraft and ground vehicle noise levels in front and backyards of residences A82-20058
NASA research activities in aeropropulsion [NASA-TM-82788] N82-16084
Multiple pure tone elimination strut assembly --- air breathing engines [NASA-CASE-FRC-11062-1] N82-16800
Blade planform for a quiet helicopter [NASA-CR-166256] N82-17121
Helicopter propulsions systems. 1: Vibration prevention systems on helicopters 2: Problem of noise in the cabin N82-17222

NOISE SPECTRA
Comparison of acoustic data from a 102 mm conic nozzle as measured in the RAE 24-foot wind tunnel and the NASA Ames 40- by 80-foot wind tunnel [NASA-TM-81343] N82-16083

Analytical study of twin-jet shielding [NASA-CR-165102] N82-16801

NONDESTRUCTIVE TESTS
Low-frequency eddy current inspection of aircraft structure A82-21900
US Naval fleet aircraft corrosion N82-17350
Detection and prevention of corrosion in Royal Air Force aircraft N82-17351

NOSE TIPS
Development and laboratory testing of a thermal emission velocimeter for application to an erosion nose tip test facility [AD-A107713] N82-17482

NOTCH TESTS
Crack growth behavior of center-cracked panels under random spectrum loading A82-20511

NOZZLE DESIGN
Low speed testing of the inlets designed for a tandem-fan V/STOL nacelle [AIAA PAPER 81-2627] A82-19210
The design of compact asymmetric maximum-thrust nozzles for a given lift force A82-19814

NOZZLE EFFICIENCY
The design of compact asymmetric maximum-thrust nozzles for a given lift force A82-19814

NOZZLE FLOW
Experimental investigation of a jet inclined to a subsonic crossflow [AIAA PAPER 81-2610] A82-19202

NOZZLE GEOMETRY
Tests of a D vented thrust deflecting nozzle behind a simulated turbofan engine [NASA-CR-3508] N82-17122

NOZZLE THRUST COEFFICIENTS
The design of compact asymmetric maximum-thrust nozzles for a given lift force A82-19814
Tests of a D vented thrust deflecting nozzle behind a simulated turbofan engine [NASA-CR-3508] N82-17122

NUMERICAL ANALYSIS
Results of calculations N82-17198
The through flow calculations N82-17199

NUMERICAL CONTROL
Graphics in numerical control - The user's challenge A82-20277
Propulsion system controls design and simulation [AIAA PAPER 82-0322] A82-22091

O

OCEANOGRAPHIC PARAMETERS
Structure and variability of the Alboran Sea frontal system A82-20447

OFFSHORE PLATFORMS
The case for helicopter hoisting A82-21597

OILS
Visualization of laminar separation by oil film method A82-20811

OMEGA NAVIGATION SYSTEM
Differential Omega system development and evaluation [AD-A107857] N82-17146

ONBOARD DATA PROCESSING
Piloted simulation of an on-board trajectory optimization algorithm A82-20296
Size reduction flight test airborne data systems A82-20766
The Boeing Flight Test Data System 1980 A82-20769
Automation of on-board flightpath management [NASA-TM-84212] N82-16088
An alternative approach to engineering structures using monitoring systems N82-17223

THRUST CONTROL
Thrust modulation methods for a subsonic V/STOL aircraft [AIAA PAPER 81-2633] A82-19213
Thrust management - Current achievements and future developments A82-20520
THRUST DISTRIBUTION
Tests of a D vented thrust deflecting nozzle behind a simulated turbofan engine [NASA-CR-3508] N82-17122
THRUST REVERSAL
Thrust-induced effects on low-speed aerodynamics of fighter aircraft [AIAA PAPER 81-2612] A82-19203
STOL capability impact on advanced tactical aircraft design [AIAA PAPER 81-2617] A82-19206
THRUST VECTOR CONTROL
Thrust-induced effects on low-speed aerodynamics of fighter aircraft [AIAA PAPER 81-2612] A82-19203
Tactical STOL moment balance through innovative configuration technology [AIAA PAPER 81-2615] A82-19204
Application of thrust vectoring for STOL [AIAA PAPER 81-2616] A82-19205
STOL capability impact on advanced tactical aircraft design [AIAA PAPER 81-2617] A82-19206
Design features of a sea-based multipurpose V/STOL, STOVL, and STOL aircraft in a support role for the U.S. Navy [AIAA PAPER 81-2650] A82-19218
TILT ROTOR AIRCRAFT
Ground effect hover characteristics of a large-scale twin tilt-nacelle V/STOL model [AIAA PAPER 81-2609] A82-19201
Analysis of selected VTOL concepts for a civil transportation mission [AIAA PAPER 81-2655] A82-19220
Flexibility is offered by XV-15 tilt-rotor concept A82-19300
TOLERANCES (MECHANICS)
Analysis and tolerance study of an array antenna for a new generation of secondary radars A82-19521
Damage tolerant design for cold-section turbine engine disks [AD-A107863] N82-17176
TORSIONAL VIBRATION
Helicopter propulsions systems. 1: Vibration prevention systems on helicopters 2: Problem of noise in the cabin N82-17222
TRACKING RADAR
SIMATR - An air battle simulation of the USAF Tactical Air Control System /TACS/ with Advanced Tactical Radars A82-19256
TRADEOFFS
Predesign study for a modern 4-bladed rotor for the NASA rotor systems research aircraft [NASA-CR-166153] N82-16042
TRAINING ANALYSIS
Report covering experience obtained at the German Lufthansa with respect to training involving the use of flight simulators A82-19274
TRAINING DEVICES
Procurement of the new flight and tactics simulators - Experience, problems, meaning [DGLR PAPER 81-095] A82-19266
Training in the flight and tactics simulator of the Navy Flight Squadron 3 'Graf Zeppelin' [DGLR PAPER 81-109] A82-19273
TRAINING SIMULATORS
Experience with flight simulators - Training effectiveness-future developments [DGLR PAPER 81-110] A82-19263
Cost efficiency versus objective fidelity in flight simulation [DGLR PAPER 81-104] A82-19264
Properties of the new flight and tactics simulators [DGLR PAPER 81-106] A82-19265
Requirements regarding digital external view systems for full mission flight and tactics simulators [DGLR PAPER 81-100] A82-19267
Flight simulation consoles, aid or obstruction - Objective evaluation of control consoles of modern flight and tactics simulators [DGLR PAPER 81-097] A82-19269
Report covering experience obtained at the German Lufthansa with respect to training involving the use of flight simulators A82-19274
Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981 A82-20526
The simulator and the airline pilot A82-20527
ASW and weapon system simulation with reference to the Nimrod MR Mk2 maritime crew trainer A82-20531
Advanced simulation --- in commercial aviation A82-20535
TRAJECTORIES
A generalized escape system simulation computer program: A user's manual [AD-A106152] N82-16055
TRAJECTORY CONTROL
The use of adaptive control for helicopter trajectories in search operations A82-19065
TRAJECTORY OPTIMIZATION
Piloted simulation of an on-board trajectory optimization algorithm A82-20296
Automation of on-board flightpath management [NASA-TM-84212] N82-16088
TRANSDUCERS
Current pressure measuring system in the transonic wind tunnel [AD-A106272] N82-16096
A durable, intermediate temperature, direct reading heat flux transducer for measurements in continuous wind tunnels [AD-A107729] N82-17483
TRANSIENT HEATING
Transient two-dimensional temperature distributions in air-cooled turbine blades A82-18893
TRANSIENT RESPONSE
Problems of engine response during transient maneuvers N82-17221
TRANSMISSION EFFICIENCY
Microwave systems for radar guided missiles A82-18936
TRANSMISSIONS (MACHINE ELEMENTS)
Helicopter transmissions; Proceedings of the Symposium, London, England, February 6, 1980 A82-20540
Airworthiness of helicopter transmissions A82-20541
Helicopter transmission philosophy - The way ahead A82-20546
Helicopter Propulsion Systems [AGARD-CP-302] N82-17203
Advanced transmission component development N82-17214
TRANSOCEANIC FLIGHT
Consequences of American airline deregulation - Legislative theory in a concrete example A82-19947
Gateway diversity and competition in international air transportation A82-21474
TRANSONIC COMPRESSORS
BBC/Sulzer. 4 stage transonic compressor N82-17197
The through flow calculations N82-17199
TRANSONIC FLOW
Numerical solution of three-dimensional unsteady transonic flow over wings including inviscid/viscous interactions [AIAA PAPER 82-0352] A82-19797
Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts [AIAA PAPER 82-0255] A82-22077
Deviation/turning angle correlations N82-17193

Single stage transonic compressor and equivalent
plane cascade
N82-17196

TRANSONIC FLUTTER
Some experimental investigations on transonic
flutter characteristics of thin plate wing
models with sweptback and tapered tips
[NAL-TR-682] N82-16050
A wind tunnel study of the flutter characteristics
of a supercritical wing
[NLR-MP-81002-U] N82-17129

TRANSONIC SPEED
Subsonic and transonic roll damping measurements
on Basic Finner --- finned missile calibration
model
A82-19958
Wing-canard aerodynamics at transonic speeds -
Fundamental considerations on minimum drag
spanloads
[AIAA PAPER 82-0097] A82-22046

A CONTINUING BIBLIOGRAPHY WITH INDEXES

(Supplement 149)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in May 1982 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

Scientific and Technical Information Branch 1982
National Aeronautics and Space Administration
Washington, DC

MHz is reported. Main trends in tests on the effects of the electrical conductivity, the gap, the closeness to edges, and the presence of microcracks on the parameters of the device are established. A reduction in the quality factor is observed when the transducer is placed on a part with a defect, which causes a reduction in the amplitude or even a halt to the oscillation, indicating that simple self-excited flaw detectors working at elevated frequencies can be made with high sensitivity to surface defects. D.L.G.

A82-23678 On the sonic fatigue life estimation of skin structures at room and elevated temperatures. S. Maekawa (Kawasaki Heavy Industries, Ltd., Gifu, Japan). *Journal of Sound and Vibration*, vol. 80, Jan. 8, 1982, p. 41-59. 15 refs.

The Monte Carlo method of nonlinear response analysis and a fatigue life estimation scheme based on a rheological model have been used to estimate the sonic fatigue life of heated skin structures. Calculations for a skin-stringer panel are compared with experimental data and it is found that, with properly selected fatigue notch factor, the analysis provides fairly accurate estimate of the acoustic fatigue life. The effects of temperature, static pressure, and oil canning on the acoustic fatigue life are discussed. V.L.

A82-23751 Welding technology for the aerospace industry; Proceedings of the Conference, Las Vegas, NV, October 7, 8, 1980. Conference sponsored by the American Welding Society. Miami, FL, American Welding Society, 1981. 183 p.

The conference focused on the welding processes most important to future commercial and military aeronautic framework design and construction, aircraft hardware reclamation, and materials evaluation. Processes covered include diffusion welding, laser welding, electron beam welding, superplastic forming, keyhole plasma arc welding, inertia welding, and resistance welding. Other topics include weldability of critical materials and alternatives, welding supports such as adaptive controls, digital arc welding programmers, and the application of fracture control. Finally, repair welding is discussed. V.L.

A82-23753 Novel approaches to electron beam welding machine utilization. F. S. Pogorzelski (McDonnell Aircraft Co., St. Louis, MO). In: Welding technology for the aerospace industry; Proceedings of the Conference, Las Vegas, NV, October 7, 8, 1980. Miami, FL, American Welding Society, 1981, p. 41-53.

Several applications that require unique and novel approaches to the utilization of electron-beam welding equipment for profitable production are discussed. One of the applications is the welding of F-15 pylon posts fabricated from annealed Ti-6Al-4V die forging. A 100% penetration first weld pass in a tapered thickness butt joint is produced using a chart programmer set up with the plot of the high voltage required versus position along the length of the tapered joint; the programmer is coupled to the power-stat of the electron-beam welding machines so that the welding power is increased automatically to the proper value as the welding gun traverses from the thick to the thin section of the joint. Electron-beam welding of F-15 wing skin 'kick rib' machined from a solid plate of Ti-6Al-4V and the development of a blind tracking device for electron-beam welding are also discussed. V.L.

A82-23754 Diffusion bonding in superplastic forming/diffusion bonding. J. R. Williamson (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). In: Welding technology for the aerospace industry; Proceedings of the Conference, Las Vegas, NV, October 7, 8, 1980. Miami, FL, American Welding Society, 1981, p. 55-83. 8 refs.

Mechanisms of the superplastic forming/diffusion bonding process are discussed with reference to the fabrication of titanium structures for aerospace applications. Primary factors affecting diffusion bonding are examined including process variables such as pressure, temperature, and time, and material variables such as surface roughness, surface cleanliness, and grain size. Two additional factors become important because of the nature of the process. When forming must occur prior to bonding, it is necessary to maintain surfaces to be bonded in a noncontaminated, nonoxidized condition. Secondly, when a maskant is used for selective diffusion bonding, it is important to insure that the maskant does not interfere with diffusion bonding in the adjacent nonmasked areas. V.L.

A82-23755 Aluminum and its alloys - Weldability. I. B. Robinson (Kaiser Aluminum and Chemical Corp., Pleasanton, CA). In: Welding technology for the aerospace industry; Proceedings of the Conference, Las Vegas, NV, October 7, 8, 1980. Miami, FL, American Welding Society, 1981, p. 85-108. 14 refs.

Non-heat-treatable and heat-treatable aluminum alloys are examined with reference to their behavior during welding and their fusion weldability. It is shown that with existing aluminum alloys, the properties of fusion welded joints can be improved by minimizing the effective heat input and by using postweld heat treatments. High-intensity welding sources can provide greater penetration and narrower welds for higher strengths. However, poor fusion weldability of many high-strength alloys is due to their composition and microstructure, and great improvements in weldability and strength would require new alloys. The use of solid-state welding techniques in conjunction with heat treatment minimizes the problems of heat damage and offers possibilities of higher-strength welds in high-strength alloys. V.L.

A82-23757 Welding for low-cost advanced titanium airframe structures. R. W. Messler, Jr. and C. A. Paez (Grumman Aerospace Corp., Bethpage, NY). In: Welding technology for the aerospace industry; Proceedings of the Conference, Las Vegas, NV, October 7, 8, 1980. Miami, FL, American Welding Society, 1981, p. 123-138.

The fabrication of F-14 wing center section and other wing and fuselage parts, which relies heavily on electron beam welding, is described to demonstrate that welding is a valuable, versatile, and widely available technique for building low-cost advanced titanium structures for modern airframes. The advantages of welding include improved structural efficiency, improved material utilization, expanded near-net-shape processing capability, and structural optimization. To be most beneficial, the welding processes employed should provide high joint efficiencies for static and fatigue loading, high quality, low distortion and shrinkage, and high welding speeds or deposition rates to minimize welding labor intensity. V.L.

A82-23771 # Material/structure degradation due to fretting and fretting-initiated fatigue. D. W. Hoeppner (Toronto, University, Toronto, Canada). *(Canadian Aeronautics and Space Institute, Annual General Meeting, Montreal, Canada, May 11, 1981.) Canadian Aeronautics and Space Journal*, vol. 27, 3rd Quarter, 1981, p. 213-221. 6 refs.

The causes, effects, and possible remedies for fretting fatigue are examined. Fretting occurs on the surfaces of two objects in contact and in relative motion to one another, and results in either corrosion or wear, surface stress concentrations or surface and subsurface stresses, or component failure. Models of a fretting damage threshold are reviewed, noting that once the threshold has been crossed, no further fretting damage is of concern because fatigue cracks are proceeding from the fret-induced damage. Specific areas and components subject to fretting damage on aircraft airframes, transmissions, engines, and shafting are provided, and measures to reduce fretting have included vibration elimination, slip prevention, and sealing off the part from the atmosphere. Further techniques for individual cases are indicated. M.S.K.

A82-23772 # A new approach to the problem of stress corrosion cracking in 7075-T6 aluminum. W. Wallace (National Aeronautical Establishment, Structures and Materials Laboratory, Ottawa, Canada), M. C. de Malherbe (Carleton University, Ottawa, Canada), and J. C. Beddoes. *(Canadian Aeronautics and Space Institute, Annual General Meeting, Montreal, Canada, May 11, 1981.) Canadian Aeronautics and Space Journal*, vol. 27, 3rd Quarter, 1981, p. 222-232. 7 refs. Research supported by the Natural Sciences and Engineering Research Council of Canada.

A study on the potentials of retrogression and reaging (RRA) aerospace aluminum alloys in the 7000 series to gain the T73 temper and T6 strength levels is reported. The investigation covered the determination of the form of the RRA reactions in 7075-T6 Al by using hardness, yield strength, and electrical conductivity measurements, a wider range of temperatures and times which would allow thicker specimens to be treated, and confirmed the improved stress corrosion resistance. Fittings were heat treated in silicone oil baths, subjected to computer controlled servo-hydraulic tests, tested for stress corrosion crack growth rates, and treated with seawater solutions. No relation was found between stress corrosion and yield strength, and the RRA treatment produced crack growth rates similar to the T73 alloy with T6 strength. Additionally, the stress corrosion resistance of 7075 Al aged to or beyond the T6 condition was found proportional to the electrical conductivity of the material. M.S.K.

A82-23774 # **F/A-18 weapon system development.** M. J. Tkach (McDonnell Aircraft Co., St. Louis, MO). *(Canadian Aeronautics and Space Institute, Flight Test Symposium, Cold Lake, Alberta, Canada, Mar. 31-Apr. 1, 1981.) Canadian Aeronautics and Space Journal,* vol. 27, 3rd Quarter, 1981, p. 242-252.

The design and operation of the F/A-18 cockpit, controls, avionics displays, and weapons systems control are described. The cockpit is equipped with three head-down 5 in. x 5 in. CRTs, an up-front control for communication, navigation, and identification purposes, and an HUD. The pilot needs to move his head only 22 deg from the HUD to the up-front control, while the HUD displays navigation and weapon delivery information, both air-to-air and air-to-ground. A Hands On Throttle and Switching has switches on the stick and throttle for pilot control of the weapons, sensors, and displays during time-critical periods, in addition to control of the radar modes. All AIM-7 and -9 missile firings to date have resulted in hits, while the lack of traditional airspeed indicators, coupled with the quiet cockpit and new maneuvering flaps have caused problems in maintaining airspeed control, with rectification difficult due to the complexity of the electronics. M.S.K.

A82-23826 * # **Design of supercritical swept wings.** P. Garabedian and G. McFadden (New York University, New York, NY). *AIAA Journal,* vol. 20, Mar. 1982, p. 289-291. 11 refs. Grants No. NGR-33-015-201; No. NSG-1579.

Computational fluid dynamics are used to discuss problems inherent to transonic three-dimensional flow past supercritical swept wings. The formulation for a boundary value problem for the flow past the wing is provided, including consideration of weak shock waves and the use of parabolic coordinates. A swept wing code is developed which requires a mesh of 152 x 10 x 12 points and 200 time cycles. A formula for wave drag is calculated, based on the idea that the conservation form of the momentum equation becomes an entropy inequality measuring the drag, expressible in terms of a small-disturbance equation for a potential function in two dimensions. The entropy inequality has been incorporated in a two-dimensional code for the analysis of transonic flow over airfoils. A method of artificial viscosity is explored for optimum pressure distributions with design, and involves a free boundary problem considering speed over only a portion of the wing. M.S.K.

A82-23828 # **Oscillating supersonic/hypersonic wings at high incidence.** W. H. Hui, M. F. Platzer (U.S. Naval Postgraduate School, Monterey, CA), and E. Youroukos. *AIAA Journal,* vol. 20, Mar. 1982, p. 299-304. 11 refs.

An approximate analytic method is developed for predicting the aerodynamic stability of oscillating supersonic/hypersonic flat wings at a mean angle of attack. It uses the known exact unsteady unified supersonic/hypersonic flow solution for a two-dimensional flat plate plus the strip theory approximation to obtain the formulas for the stability derivatives. They are applicable for wings of arbitrary planform shape at arbitrary angles of attack provided the shock wave is attached to the leading edge of the wing. Good agreement is obtained with existing theories in various special cases. The formulas for stability derivatives given here become exact in the Newtonian limit. (Author)

A82-24001 # **Reliability centered maintenance /RCM/.** F. S. Nowlan (United Air Lines, Inc., Chicago, IL). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 4 p.

Inherent reliability characteristics of transport aircraft are described, and principles of reliability-centered maintenance (RCM) are discussed. Airworthiness regulations are noted to be directed at failure events that have not yet occurred, but which theoretical analyses indicate have an unacceptable probability of happening. Specific requirements are communicated to engineers, and compliance results in either no occurrence of failure, or sufficient redundancy of performance to offset failure. RCM procedures involve component inspection at specified intervals, part overhaul before the failure interval is approached, discarding parts before the failure life is passed, and finding failures in hidden-function items which crewmembers may not have noticed. On-condition tasks are given higher priority, followed by a rework task and then a discard task. The effects on safety of the aircraft is the measure of the task hierarchy. M.S.K.

A82-24002 # **A310 - Design for maintenance.** R. Cutler (Airbus Industrie, Blagnac, Haute-Garonne, France). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 17 p.

The way in which Airbus Industrie deals with maintenance during the design phase is described, noting that by giving maintenance the attention it merits, its proportion of direct operating costs is kept to a minimum. Aircraft design is continuously subjected to a maintainability and reliability (M & R) review in order to ensure optimum trade-offs between M & R and other goals. This review process comprises five steps: (1) apportioning M & R goals to systems, components, etc., as required; (2) reviewing in-service experience to identify past problems and areas having the greatest potential for development; (3) evaluating design using M & R analytical techniques to identify questionable areas; (4) holding review meetings with designers and equipment suppliers to determine what improvements can be made; and (5) holding management progress review meetings to assess overall M & R performance in relation to goals, highlighting areas where goal attainment is unlikely, and specifying further actions. C.R.

A82-24003 # **Development of maintenance programmes through the functional, structural and flight test phases.** R. E. Grigg (British Aerospace Public, Ltd., Co., Weybridge, Surrey, England). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 9 p.

Methods employed by British Aerospace to develop minimized maintenance plans for use by airline mechanics are described, with particular regard to the B. Ae. 146. The 146 was designed for simplicity with constraints imposed by maintenance cost targets and monitoring to meet contractual commitments. All systems were monitored at component levels, and the occurrence of full mock-up with real hardware initiated the development of maintenance schedules. A logic analysis procedure was used to determine cost effective maintenance programs by scheduling maintenance on parts which affect safety and operational economy, and defined the tasks to be performed. Failure modes were defined for each functional component and a probability level of acceptance before catastrophic failure was set. Further steps included flight development maintenance monitoring, task monitoring, the establishment of servicing locations, design of a structural inspection program, and the definition of structure life and inspection goals. M.S.K.

A82-24004 # **Air cooled engine test facilities.** G. F. Dawson (Industrial Acoustics Co., Ltd., Staines, Middx., England). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 6 p.

The equipment and instrumentation of an operating comprehensive acoustic test facility for aircraft are described. Specifications include air cooling and the capability of handling a reheat engine with a back-on-the-bed time of 30 min after engine shut-off. The facility is totally demountable, yet includes an acoustic enclosure, an intake silencer, and augmentor tube, a primary diffuser, a secondary suppressor, a plenum chamber, exhaust splitter elements, an exhaust stack, and a weather-proofed and sound-insulated control room. Prerigged engines are mounted on the test bed over a trolley prewired and connected for all pneumatic and electronic parameters. Engine test time is reduced by 50% over conventional testing methods due to an instantaneous computerized display of test results, automatic input and logging of data, audible and visual alarm systems, diagnostic checking procedures, and manual reversion capabilities on the controls. M.S.K.

A82-24649 # **Loran-C RNAV in mountainous areas.** L. Rzonca (FAA, Technical Center, Atlantic City, NJ). In: Institute of Navigation, Annual Meeting, 37th, Annapolis, MD, June 9-11, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 129-140.

The loran-C kilohertz frequency provides stable ground wave propagation with signal coverage which is not limited to line-of-sight between transmitter and receiver. This feature makes loran-C very attractive for aircraft RNAV between airports located in mountainous terrain or other areas not adequately served by the VOR/DME network. An important part of an airborne loran-C evaluation program currently being conducted consists of loran-C accuracy testing in mountainous areas. The first phase, consisting of flight tests in the state of Vermont, has been completed. A description of these tests is presented, taking into account the equipment, the test scenario, and aspects of data processing. The test results obtained verify the potential of loran-C to provide aircraft navigation guidance under all terrain conditions. However, there appears to be a need for further refinement of hardware and of software techniques. G.R.

A82-24650 # **Analysis of loran-C system reliability for civil aviation.** G. A. Wong (Mitre Corp., McLean, VA). In: Institute of Navigation, Annual Meeting, 37th, Annapolis, MD, June 9-11, 1981, Proceedings. Washington, DC, Institute of Navigation, 1981, p. 141-153. 8 refs.

The considered analysis is concerned with the ability of the loran-C system to provide continuous and usable navigation signals for airborne applications. An overview is provided of the analysis techniques, and a description is presented of the computerized loran-C coverage model which is used extensively in the reliability analysis. The probabilistic approach to reliability analysis is discussed, and the overall methodology for the analysis of loran-C system reliability in the conterminous U.S. is illustrated with the aid of an example. The ultimate objective of the loran-C system reliability assessment is to determine the ground station configuration which would meet the civil aviation reliability requirement in the post-1995 time period. G.R.

A82-24651 **Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers.** Conference sponsored by the American Institute of Aeronautics and Astronautics. New York, American Institute of Aeronautics and Astronautics, 1982. 332 p. Members, $30. nonmembers, 40.

Techniques, modeling, instrumentation, and applications of wind tunnels, wind tunnel apparatus, and models were discussed. The Shuttle testing and data base for aerodynamics predictions are examined, along with comparisons with flight data. Further attention was given to wind tunnel design and features, including tunnel liners, a quiet tunnel, choking valves, and slotted wall test sections. Techniques for instrumentation of boundary layers, surface shear stress measurements in compressible flows, laminar skin friction, and the use of aerodynamic balance systems to measure cross and cross-coupling derivatives are explored. The performance of a computer controlled variable geometry wing is described, along with the development of a self-optimizing flexible technology wing wind tunnel model, improvements in the National Full Scale Facility, and a color video display for flowfield surveys. M.S.K.

A82-24656 * # **Numerical design of the contoured wind-tunnel liner for the NASA swept-wing LFC test.** P. A. Newman, E. C. Anderson, and J. B. Peterson, Jr. (NASA, Langley Research Center, Hampton, VA). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 36-47. 26 refs. (AIAA 82-0568)

A contoured, nonporous, wind-tunnel liner has been designed in order to simulate a free-flight infinite yawed-wing, transonic-flow condition about a large-chord, supercritical-section, laminar-flow-control (LFC), swept-wing test panel. The numerical procedure developed for this aerodynamic liner design is based upon the simple idea of streamlining and incorporates several existing transonic and boundary-layer analysis codes. A summary of the entire procedure is presented to indicate: what was done and why, the sequence of steps, and the overall data flow. The liner is being installed in the NASA Langley 8-Foot Transonic Pressure Tunnel (TPT). Test results indicating the aerodynamic performance of the liner are not yet available; thus, the liner design results given here are examples of the calculated requirements and the hardware implementation. (Author)

A82-24657 * # **Mean flow and noise measurements in a Mach 3.5 pilot quiet tunnel.** I. E. Beckwith and W. O. Moore, III (NASA, Langley Research Center, Hampton, VA). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 48-70. 30 refs. (AIAA 82-0569)

The use of Mach 3.5 two-dimensional rapid expansion nozzle for wind tunnel testing at supersonic speeds and low noise conditions encountered in high altitude flights is described. The supersonic pilot quiet tunnel is located at the NASA Langley Research Center and a description of the facility is provided, along with instrumentation and noise measurement test data at 30, 50, and 75 psia. The mean pitot pressure distributions, rms noise levels, the effect of unit Reynolds number, wall waviness, wall contaminants, and the effects of closing the bleed valve are analyzed. Typical laminar and turbulent spectra are presented, along with a summary of the effect of slot throat adjustment on the power spectra. Comparisons are made of the power spectra with the bleed valve open and closed, and of the rms fluctuating pressures with levels from conventional nozzles, and the performance capabilities are evaluated for use in transition studies. M.S.K.

A82-24658 * # **The effect of ejector augmentation on test-section flow quality in the Calspan 8-ft transonic wind tunnel.** W. C. Rose (Rose Engineering and Research, Inc., Incline Village, NV), R. D. Hanly, F. W. Steinle, Jr. (NASA, Ames Research Center, Moffett Field, CA), and D. W. Chudyk (Calspan Advanced Technology Center, Buffalo, NY). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 71-86. (AIAA 82-0571)

Tests to determine the flow disturbances effects of four ejectors located in the corners just downstream of the diffuser in the Calspan wind tunnel are described. The flow quality in the nonejector mode is employed as the base-line configuration, and operating parameters are compared with data from other wind tunnels. During tests with the ejectors working, fluctuation levels increased between Mach 0.4-0.6, while temperature and vorticity levels remained constant. The ejector exhibited broad spectrum noise typical of free jet noise, yet static pressure measurements revealed only a slight increase in the broadband rms levels with the ejectors on, indicating negligible disturbances upstream caused by the ejectors. Choking the diffuser eliminated the jet noise, and the use of ejectors in the Mach range considered is concluded to cause no significant degradation in the Calspan tunnel flow quality. M.S.K.

A82-24659 # **An ejector augmented choking valve for the metering and control of inlet and bleed duct flows.** C. H. Boccadoro and B. G. Franco (Northrop Aerosciences Laboratory, Hawthorne, CA). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 87-93. 10 refs. (AIAA 82-0575)

The use of a choking valve in wind tunnel inlet-airframe models is described, along with the design of ejectors for augmentation in regulating higher weight flows and for upstream recovery conditions. The choking valve, with a plug insert, is operated by moving a plug in and out of the throat, and is calibrated for weight flow by use of Fliegner's isentropic formula for air. The ejectors are designed to produce the proper back pressure to choke the plug for all weight flows and conditions required. One-dimensional ejector theory is reviewed and determinations are made for the primary pressure, the primary weight flow, and the area ratio for the ejector system to pump a specified weight flow. An optimization process is outlined for fitting an ejector system to a choke valve, and experimental results are reported in regards the effects of the area ratio, mixing length, and the primary pressure ratio. M.S.K.

A82-24660 # **Technical innovations in testing and analysis of heat and pressure models in hypersonic wind tunnels.** H. R.

Carroll (Martin Marietta Aerospace, Denver, CO). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 94-100. 7 refs. (AIAA 82-0578)

Wind tunnel testing and analysis techniques for more cost-effective studies on projects using pressure and heat models to obtain flowfield and aerothermodynamic data in hypersonic flows are presented. Timed photographs were taken of paint melting off the nose of an MX missile model, with the paint actually an emulsified wax which retained the protuberance flow patterns when the test was terminated. Thin skin steel 0.030 in. thick was used on the cone and conic body instrumented with thermocouples and connected to a 260 channel multiplexor for data collection of millivolt output in response to heating and pressure changes due to unsteady shocks and laminar or turbulent flow. Temperature recovery methods in supersonic tunnels are discussed, along with tripping turbulent flow by means of twisted wires. Entropy measurements were accomplished by combining heating and pressure test results, Schlieren photographs, pressure rake data, and earlier data. M.S.K.

A82-24661 # **Slotted wall test section for automotive aerodynamic test facilities.** S. Raimondo and P. J. F. Clark (DSMA International, Inc., Toronto, Canada). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 101-109. 7 refs. (AIAA 82-0585)

The use of slotted walled test sections for automotive facilities was experimentally investigated. The experiments were performed at 1/5-scale, with two test section sizes which correspond to 11 sq m and 8.5 sq m equivalent full-scale facilities. For the vehicle used, the model blockages tested were 16.4 and 21.4% respectively. Among the parameters varied were the slot open-area ratio, the axial position of model within the test section and the amount of plenum flow diverted directly into the test section diffuser. The results obtained will be important to the design of small auto-aero facilities, and showed that accurate model pressure distribution data which do not require blockage corrections can be achieved for both test sections. The importance of properly controlling plenum flow at the downstream end of the test section was evident from the present tests. (Author)

A82-24663 * # **Transonic wind tunnel wall interference corrections for three-dimensional models.** M. H. Rizk (Flow Research Co., Kent, WA), M. Hafez (Flow Research Co., Kent, WA; George Washington University, Washington, DC), E. M. Murman (Flow Research Co., Kent, WA; MIT, Cambridge, MA), and D. Lovell (NASA, Langley Research Center, Hampton, VA; Flow Research Co., Kent, WA). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 120-130. 21 refs. Contract No. NAS1-16262. (AIAA 82-0588)

A procedure for the evaluation of wall interference corrections for three-dimensional models is presented. The Mach number and angle-of-attack corrections require the numerical solution of the potential equation about a simplified representation of the experimental model. Pressure measurements are required near the wind tunnel walls. The correction procedure also requires knowledge of the free-stream Mach number, the model angle of attack, and the lift force experienced by the model. The procedure provides an estimate of the accuracy of the correction. For slender configurations at Mach numbers close to one, the Equivalence Rule formulation is adopted to calculate the wall interference effects. Preliminary results are presented for both general and slender-body configurations. (Author)

A82-24668 # **Review of support interference in dynamic tests.** L. E. Ericsson and J. P. Reding (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 166-190. 79 refs. (AIAA 82-0594)

A review of existing information about support interference has revealed that the support interference effects are much more severe in dynamic than in static tests. Furthermore, the support interference is aggravated greatly by a boat-tail or dome shaped base, even by modest base shoulder roundness, from what it is for a flat-based model. The general conclusion is that asymmetric stings or sting-strut combinations should be avoided. For slender bodies at low angles of attack a transverse rod comes close to permitting the true dynamically destabilizing effect of a bulbous base to be measured whereas even a very slender sting will distort the near wake effect and produce an unconservatively high measure of the dynamic stability. At intermediate and high angles of attack the sting support is superior to the other support methods, the transverse rod or the strut mounting. In many cases half-model testing provides the means to avoid most of the support interference effects. In some cases, as for a short blunt body such as the Viking configuration, the best approach appears to be to allow sting plunging, using a very slender sting. (Author)

A82-24669 # **The use of a multi-degree-of-freedom dual balance system to measure cross and cross-coupling derivatives.** D. R. Haberman (Calspan Field Services, Inc., Arnold Air Force Station, TN). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 191-201. 6 refs. (AIAA 82-0595)

Equations of motion and a data reduction method are presented for a dual balance system for measuring dynamic cross and cross-coupling derivatives for aerodynamic models in wind tunnel tests. The balances each weigh 1500 lb, with one to provide forced oscillation, pitch/yaw, and cross flexure as a motion generator, and the other to create pitch/yaw, or roll planes as a load measuring device. Both balances are noted to be similar to a five-component static force balance, and balance deflections are measured by holographic interferometry. The Lagrange method is used to derive the equation of motion in roll, and locations of the center of gravity are calculated from the known balance dimensions. Balance measurements are converted into a force and a moment about a selected reference point by substituting the measured load vectors into the static balance equation. Further consideration is given to roll data reduction and the correction of existing roll data. M.S.K.

A82-24670 # **Cross and cross-coupling derivative measurements on the standard dynamics model at AEDC.** S. M. Coulter and E. J. Marquart (Calspan Field Services, Inc., Arnold Air Force Station, TN). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 202-214. 9 refs. (AIAA 82-0596)

A description of newly developed pitch, yaw, and roll forced-oscillation balance systems is presented. These systems were designed with a particular goal of obtaining cross and cross-coupling derivative measurements at high angles of attack. Results of laboratory and wind tunnel tests (from Mach 0.3 to 1.3) are discussed. Cross and cross-coupling derivatives, direct dynamic, and static data, obtained from testing the Standard Dynamics Model (SDM) are shown for several test conditions. Comparisons to a previously obtained dynamic and static data base for this model show good agreement, verifying the accuracy of the measured parameters. (Author)

A82-24673 # **Development of a self-optimizing flexible technology /SOFT/ transonic wing wind tunnel model.** A. A. McClain and S. Pountney (General Dynamics Corp., Convair Div., San Diego, CA). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 230-238. Contract No. N00014-76-C-0742. (AIAA 82-0601)

The SOFT-wing concept automatically adapts the wing shape through computer control. Designing the model to meet the criteria of transonic testing required the investigation and application of innovative techniques. Major design and fabrication features of the model included rectangular hydraulic actuators machined integrally in the spar, highly accurate linear potentiometers, leading- and trailing-edge skins of composite materials, a leading-edge extension mechanism, flexible wing tips, and a self-trimming horizontal stabilizer. It was concluded that an automated model is expensive to

Active beacon collision avoidance logic evaluation. Volume 2: Collision avoidance (BCAS) threat phase [AD-A107805] N82-17148
FLIGHT SIMULATION
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation [AIAA PAPER 81-2663] A82-19221
Utilization of hybrid computational equipment for the simulation of parachute system flight A82-19234
Real-Time Simulation Computation System --- for digital flight simulation of research aircraft A82-19260
Cost efficiency versus objective fidelity in flight simulation [DGLR PAPER 81-104] A82-19264
Flight simulation consoles, aid or obstruction - Objective evaluation of control consoles of modern flight and tactics simulators [DGLR PAPER 81-097] A82-19269
Piloted simulation of an on-board trajectory optimization algorithm A82-20296
Advanced simulation --- in commercial aviation A82-20535
Analytical control law for desirable aircraft lateral handling qualities A82-21941
A simple hybrid visual simulation for research flight simulators [ESA-TT-690] N82-17232
FLIGHT SIMULATORS
A terminal guidance simulator for evaluation of millimeter wave seekers A82-18937
Experience with flight simulators - Training effectiveness-future developments [DGLR PAPER 81-110] A82-19263
Properties of the new flight and tactics simulators [DGLR PAPER 81-106] A82-19265
Procurement of the new flight and tactics simulators - Experience, problems, meaning [DGLR PAPER 81-095] A82-19266
Requirements regarding digital external view systems for full mission flight and tactics simulators [DGLR PAPER 81-100] A82-19267
The procurement of flight simulators at the German Lufthansa [DGLR PAPER 81-093] A82-19268
Official recognition and the significance of simulators for safe flight operations [DGLR PAPER 81-094] A82-19271
Simulation of modern radar installations in full-mission flight and tactics simulators [DGLR PAPER 81-103] A82-19272
Training in the flight and tactics simulator of the Navy Flight Squadron 3 'Graf Zeppelin' [DGLR PAPER 81-109] A82-19273
Report covering experience obtained at the German Lufthansa with respect to training involving the use of flight simulators A82-19274
Experience and needs of civil and military flight simulator users; Proceedings of the Flight Simulation Symposium, London, England, April 7, 8, 1981 A82-20526
The simulator and the airline pilot A82-20527
The use of flight simulators in l'Armee de l'Air A82-20528
The aircraft manufacturer's needs as a simulator user A82-20530
Automation in flight simulation of data handling and validation testing A82-20532
The effects on simulators of advances in aircraft technology A82-20533
Advanced simulation --- in commercial aviation A82-20535
A European airline's future simulator requirements A82-20536
An independent view of where civil simulation should be headed --- training simulators for civil aircraft A82-20537
Simulator data test instrumentation - Flight test challenge of the eighties A82-20768
Implementation of the recommendations made on the technical report titled analysis of advanced simulator for pilot training [AD-A106779] N82-16094
Numerical and flight simulator test of the flight deterioration concept [NASA-CR-3500] N82-16655
A simple hybrid visual simulation for research flight simulators [ESA-TT-690] N82-17232
FLIGHT TEST INSTRUMENTS
Development of a simple, self-contained flight test data acquisition system [NASA-CR-168438] N82-17478
FLIGHT TESTS
Flexibility is offered by XV-15 tilt-rotor concept A82-19300
An analytical technique for the analysis of airplane spin entry and recovery [AIAA PAPER 82-0243] A82-19786
Automation in flight simulation of data handling and validation testing A82-20532
Laser communications via an atmospheric link A82-20615
Flight testing in the eighties; Proceedings of the Eleventh Annual Symposium, Atlanta, GA, August 27-29, 1980 A82-20751
Initial F-18 carrier suitability testing A82-20752

OPERATING COSTS
- Operability of military aircraft - Some design and cost trends A82-20565
- We have just begun to create efficient transport aircraft A82-21373
- Use of optimization to predict the effect of selected parameters on commuter aircraft performance [NASA-CR-168439] N82-17151
- An airline view of the corrosion problem N82-17352

OPERATING SYSTEMS (COMPUTERS)
- Research through simulation --- simulators and research applications at Langley [NASA-FACTS-125] N82-16092

OPERATOR PERFORMANCE
- Flight simulation consoles, aid or obstruction - Objective evaluation of control consoles of modern flight and tactics simulators [DGLR PAPER 81-097] A82-19269

OPTICAL COMMUNICATION
- Laser communications via an atmospheric link A82-20615

OPTICAL RADAR
- Airborne lidar measurements of smoke plume distribution, vertical transmission, and particle size A82-21386

OPTICAL WAVEGUIDES
- Test and evaluation of UV fiber optics for application for aircraft fire detector systems [AD-A106129] N82-16850

OPTIMIZATION
- Optimum journal bearing parameters for minimum rotor unbalance response in synchronous whirl [ASME PAPER 81-DET-55] A82-19314
- Optimal shape design of turbine blades [ASME PAPER 81-DET-128] A82-19342
- Application of structural optimization technique to reduce the external vibrations of a gas-turbine engine [ASME PAPER 81-DET-143] A82-19351
- Power system design optimization using Lagrange multiplier techniques A82-20743
- Experimental verification of an aerodynamic parameter optimization program for wind tunnel testing [AD-A107727] N82-17134
- Use of optimization to predict the effect of selected parameters on commuter aircraft performance [NASA-CR-168439] N82-17151
- Parallel computation for developing nonlinear control procedures [AD-A107914] N82-17227

OSCILLATING FLOW
- The velocity potential for the harmonically oscillating, rectangular wing with semiinfinite span in nonlinear theory A82-19198
- Flow field around an oscillating airfoil A82-20813

OXIDATION RESISTANCE
- Improved plasma sprayed MCrAlY coatings for aircraft gas turbine applications A82-20742

P

PACKET SWITCHING
- Next generation military aircraft will require hierarchical/multilevel information transfer systems --- packet switching N82-17114

PACKET TRANSMISSION
- Tactical Airborne Distributed Computing and Networks [AGARD-CP-303] N82-17086

PADE APPROXIMATION
- Pade approximation applied to flow past thin airfoils A82-20728

PAINTS
- The experience of corrosion on French military aerodynes N82-17355

PANELS
- Analysis of multiple load path panels containing impact damage N82-17170

PARACHUTE DESCENT
- Utilization of hybrid computational equipment for the simulation of parachute system flight A82-19234

PARALLEL FLOW
- Comparison of two parallel/series flow turbofan propulsion concepts for supersonic V/STOL [AIAA PAPER 81-2637] A82-19214

PARALLEL PROCESSING (COMPUTERS)
- Parallel computation for developing nonlinear control procedures [AD-A107914] N82-17227

PARAMETER IDENTIFICATION
- Turboprop cargo aircraft systems study [NASA-CR-165813] N82-16070

PARAMETERIZATION
- Experimental verification of an aerodynamic parameter optimization program for wind tunnel testing [AD-A107727] N82-17134

PARTICLE PRECIPITATION
- Intake design with particular reference to ice protection and particle separators N82-17218

PARTICLE SIZE DISTRIBUTION
- Airborne lidar measurements of smoke plume distribution, vertical transmission, and particle size A82-21386

PATIENTS
- A comparative study on mechanical vibration and noise during patient transportation A82-19013

PCM TELEMETRY
- Recent developments in military telemetry A82-18908
- Color graphics based real-time telemetry processing system A82-20771

PERFORATED SHELLS
- Studies on the stability of thin-walled shells with cutouts /Review/. I A82-21629

PERFORMANCE PREDICTION
- Concept definition and aerodynamic technology studies for single-engine V/STOL fighter/attack aircraft [AIAA PAPER 81-2647] A82-19216
- Multi-parameter yield zone model for predicting spectrum crack growth A82-20510
- Random spectrum fatigue crack life predictions with or without considering load interactions A82-20512
- Through flow calculations in axial turbomachines [AGARD-AR-175] N82-17178
- Influence of correlations and computational methods on the prediction of overall efficiency N82-17180
- Part span damper loss prediction for transonic axial fan rotors N82-17192
- Axial compressor stall and surge N82-17194
- Summary of answers to the questionnaire N82-17195
- Single stage transonic compressor and equivalent plane cascade N82-17196
- The through flow calculations N82-17199
- Evaluation of profile loss predictions based on diffusion factors N82-17200
- Blade-to-blade computations and boundary layer corrections in axial compressors and turbines N82-17202

PERFORMANCE TESTS
- Prediction of aircraft interior noise using the statistical energy analysis method [ASME PAPER 81-DET-102] A82-19332
- Conductive prepregs for lightning strike protection on aircraft A82-20523

NAVSTAR global positioning systems A82-20601
Performance flight test evaluation of the Ball-Bartoe JW-1 Jetwing STOL research aircraft A82-20762
The Global Positioning System Evaluator --- facility for testing in simulated wide range environments A82-21508
Single stage transonic compressor and equivalent plane cascade N82-17196
BBC/Sulzer. 4 stage transonic compressor N82-17197

PHASE MODULATION
R.F. calibrators for Doppler radars A82-18917

PHASE SHIFT
R.F. calibrators for Doppler radars A82-18917

PHOTOMAPPING
Mapping in tropical forests - A new approach using the laser APR --- Airborne Profile Recorder A82-20407

PILOT PERFORMANCE
Cost efficiency versus objective fidelity in flight simulation [DGLR PAPER 81-104] A82-19264
Threat perception while viewing single intruder conflicts on a cockpit display of traffic information [NASA-TM-81341] N82-16076
Numerical and flight simulator test of the flight deterioration concept [NASA-CR-3500] N82-16655

PILOT TRAINING
Tactical Radar Threat Generator system A82-18903
Problems pertaining to aeronautical technology in the case of rescue operations with helicopters in mountainous areas A82-19010
Experience with flight simulators - Training effectiveness-future developments [DGLR PAPER 81-110] A82-19263
Cost efficiency versus objective fidelity in flight simulation [DGLR PAPER 81-104] A82-19264
Procurement of the new flight and tactics simulators - Experience, problems, meaning [DGLR PAPER 81-095] A82-19266
The procurement of flight simulators at the German Lufthansa [DGLR PAPER 81-093] A82-19268
Official recognition and the significance of simulators for safe flight operations [DGLR PAPER 81-094] A82-19271
Training in the flight and tactics simulator of the Navy Flight Squadron 3 'Graf Zeppelin' [DGLR PAPER 81-109] A82-19273
Report covering experience obtained at the German Lufthansa with respect to training involving the use of flight simulators A82-19274
The simulator and the airline pilot A82-20527
The use of flight simulators in l'Armee de l'Air A82-20528
The aircraft manufacturer's needs as a simulator user A82-20530
ASW and weapon system simulation with reference to the Nimrod MR Mk2 maritime crew trainer A82-20531
Advanced simulation --- in commercial aviation A82-20535
Implementation of the recommendations made on the technical report titled analysis of advanced simulator for pilot training [AD-A106779] N82-16094

PIPER AIRCRAFT
Resonance tests on a Piper PA-32R tailplane before and after damage [AD-A106273] N82-16071

PISTON ENGINES
A history of aircraft piston engine lubricants A82-19622

PITCHING MOMENTS
Tactical STOL moment balance through innovative configuration technology [AIAA PAPER 81-2615] A82-19204
Alleviation of the subsonic pitch-up of delta wings [AIAA PAPER 82-0129] A82-22052

PITTING
Fracture mechanics based modelling of the corrosion fatigue process N82-17344

PLASMA SPRAYING
Improved plasma sprayed MCrAlY coatings for aircraft gas turbine applications A82-20742

PLASTIC DEFORMATION
Superplastic aluminum evaluation [AD-A107760] N82-17338

PLASTICS
Pactec V - Plastics technology advances/1980 update; Proceedings of the Fifth Annual Pacific Technical Conference, Los Angeles, CA, February 26-28, 1980. Volume 3 A82-20521

PLUMES
Airborne lidar measurements of smoke plume distribution, vertical transmission, and particle size A82-21386

POLICIES
A perspective on civil use of GPS A82-21509

POLLUTION CONTROL
Noise impact on communities from aircraft [GPO-80-617] N82-17655

POLYMERIC FILMS
Transparent polyolefin film armor [AD-A107562] N82-17377

POSITION INDICATORS
Aircraft position measurement using laser beacon optics [AD-A107973] N82-16067

POTENTIAL FLOW
Analysis of an ideal-fluid flow past a finite-thickness wing A82-19813
Boundary layer transition and separation on a compressor rotor airfoil A82-20299
Pade approximation applied to flow past thin airfoils A82-20728
Isolated nacelle performance - Measurement and simulation [AIAA PAPER 82-0134] A82-22054

POTENTIAL THEORY
The velocity potential for the harmonically oscillating, rectangular wing with semiinfinite span in nonlinear theory A82-19190

POWER EFFICIENCY
Evaluation of the design, construction and operation of a gas fueled engine driven heat pump [ERG-034] N82-17459

POWER SUPPLY CIRCUITS
L-band power generation in the General Electric solid-state radar A82-18914
Power system design optimization using Lagrange multiplier techniques A82-20743

PREDICTION ANALYSIS TECHNIQUES
Methods and models for predicting fatigue crack growth under random loading --- Book A82-20506
Prediction of sound radiation from different practical jet engine inlets [NASA-CR-165120] N82-16810
Deviation/turning angle correlations N82-17193

PREPREGS
Conductive prepregs for lightning strike protection on aircraft A82-20523

PRESSURE DEPENDENCE
Pressure dependence of jet noise and silencing of blow-offs A82-20266

TURBOFAN ENGINES
Comparison of two parallel/series flow turbofan propulsion concepts for supersonic V/STOL [AIAA PAPER 81-2637] A82-19214
Energy management in military combat aircraft A82-20515
Advanced subsonic transport propulsion [AIAA PAPER 81-0811] A82-20874
ALF502 - Plugging the turbofan gap A82-21243
Tests of a D vented thrust deflecting nozzle behind a simulated turbofan engine [NASA-CR-3508] N82-17122
CF6 jet engine performance improvement: High pressure turbine roundness [NASA-CR-165555] N82-17174
Damage tolerant design for cold-section turbine engine disks [AD-A107863] N82-17176

TURBOJET ENGINES
An application of total synthesis to robust coupled design --- turbojet engine control A82-19061

TURBOMACHINE BLADES
Dynamic response of blades and vanes to wakes in axial turbomachinery [ASME PAPER 81-DET-33] A82-19307
A practical approach to systems mode analysis --- for disc-blade-shroud assemblies [ASME PAPER 81-DET-130] A82-19344
A parametric study of dynamic response of a discrete model of turbomachinery bladed disk [ASME PAPER 81-DET-137] A82-19349

TURBOPROP AIRCRAFT
Turboprop cargo aircraft systems study [NASA-CR-165813] N82-16070
A shock wave approach to the noise of supersonic propellers [NASA-TM-82752] N82-16809

TURBOSHAFTS
Minimum cost performance monitoring of turboshaft engines A82-20544
Design Criteria of the A 129 helicopter drive system N82-17215

TURBULENCE
Effects of Reynolds number and turbulence level on axial cascade performance N82-17190

TURBULENT JETS
Pressure dependence of jet noise and silencing of blow-offs A82-20266
Can low-speed jet noise be predicted A82-22222

TURBULENT WAKES
Dynamic response of blades and vanes to wakes in axial turbomachinery [ASME PAPER 81-DET-33] A82-19307

TWO DIMENSIONAL FLOW
Effects of Reynolds number and turbulence level on axial cascade performance N82-17190

TWO STAGE TURBINES
The two stage aero engine turbine N82-17183

U

ULTRAHIGH FREQUENCIES
L-band power generation in the General Electric solid-state radar A82-18914

ULTRASONIC TESTS
Ultrasonic method for flow field measurement in wind tunnel tests A82-20054
The ultrasonic inspection of C.F.C. --- carbon fiber sine wave spars [HDR-0465] N82-17513

UNCOUPLED MODES
On the formulation of coupled/uncoupled dynamics analyses of blade-disc assemblies [ASME PAPER 81-DET-126] A82-19340

UNSTEADY FLOW
Numerical solution of three-dimensional unsteady transonic flow over wings including inviscid/viscous interactions [AIAA PAPER 82-0352] A82-19797
Unsteady lifting-line theory with applications [AIAA PAPER 82-0354] A82-19798
Basic studies of the flow fields of airfoil-flap-spoiler systems [AIAA PAPER 82-0173] A82-22060
Steady and unsteady nonlinear hybrid vortex method for lifting surfaces at large angles of attack [AIAA PAPER 82-0351] A82-22094
Numerical calculation of lift, moment coefficient and dynamic stability derivatives on sideslipping wings in unsteady supersonic flows A82-22111
Theory and experiment in unsteady aerodynamics [NLR-MP-80046-U] N82-17128

UNSWEPT WINGS
Unsteady lifting-line theory with applications [AIAA PAPER 82-0354] A82-19798

UPGRADING
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes [DE82-001127] N82-17401

UPLINKING
ATCRBS uplink environment measurement near Jacksonville, Florida [AD-A108053] N82-16063

URBAN PLANNING
The city and aviation --- Russian book A82-18898
Noise impact on communities from aircraft [GPO-80-617] N82-17655

URBAN TRANSPORTATION
Comparison of aircraft and ground vehicle noise levels in front and backyards of residences A82-20058

USER REQUIREMENTS
A versatile data acquisition system for a low speed wind tunnel [AD-A106269] N82-16097

V

V/STOL AIRCRAFT
Ground effect hover characteristics of a large-scale twin tilt-nacelle V/STOL model [AIAA PAPER 81-2609] A82-19201
Experimental investigation of a jet inclined to a subsonic crossflow [AIAA PAPER 81-2610] A82-19202
Analysis of data from a wind tunnel investigation of a large-scale model of a highly maneuverable supersonic V/STOL fighter - STOL configuration [AIAA PAPER 81-2620] A82-19207
Large-scale wind tunnel tests of a sting-supported V/STOL fighter model at high angles of attack [AIAA PAPER 81-2621] A82-19208
Low speed testing of the inlets designed for a tandem-fan V/STOL nacelle [AIAA PAPER 81-2627] A82-19210
Application of thrusting ejectors to tactical aircraft having vertical lift and short-field capability [AIAA PAPER 81-2629] A82-19211
Airframe effects on top-mounted inlet systems for VSTOL fighter aircraft [AIAA PAPER 81-2631] A82-19212
Thrust modulation methods for a subsonic V/STOL aircraft [AIAA PAPER 81-2633] A82-19213
Comparison of two parallel/series flow turbofan propulsion concepts for supersonic V/STOL [AIAA PAPER 81-2637] A82-19214
Concept definition and aerodynamic technology studies for single-engine V/STOL fighter/attack aircraft [AIAA PAPER 81-2647] A82-19216
Sea based support aircraft alternatives [AIAA PAPER 81-2649] A82-19217
Design features of a sea-based multipurpose V/STOL, STOVL, and STOL aircraft in a support role for the U.S. Navy [AIAA PAPER 81-2650] A82-19218
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation [AIAA PAPER 81-2663] A82-19221
AV-8B Harrier II A82-21260
Scale-model studies for the improvement of flow patterns of a low-speed tunnel [NASA-CR-169413] N82-17228

VANES
Dynamic response of blades and vanes to wakes in axial turbomachinery
[ASME PAPER 81-DET-33] A82-19307
VARIABILITY
Structure and variability of the Alboran Sea frontal system A82-20447
VARIABLE SWEEP WINGS
A new look at the Tupolev Tu-26 'Backfire' A82-21191
VELOCITY DISTRIBUTION
Roll up model for rotor wake vortices, part 5
[ASRL-TR-194-4] N82-17127
The two stage aero engine turbine N82-17183
End-wall boundary layer calculation methods N82-17188
VELOCITY MEASUREMENT
Experimental investigation of a jet inclined to a subsonic crossflow
[AIAA PAPER 81-2610] A82-19202
Non-steady velocity measurement of the wake of a helicopter rotor at low advance ratios
[AD-A107722] N82-17133
A velocity vector measuring system with 13 asymmetric wedge type yawmeters --- measuring flow distribution around the empennage of STOL models
[NAL-TR-674] N82-17477
Development and laboratory testing of a thermal emission velocimeter for application to an erosion nose tip test facility
[AD-A107713] N82-17482
VERTICAL AIR CURRENTS
Optimal dolphin hang glider flight N82-17157
VERTICAL TAKEOFF AIRCRAFT
VTOL as it applies to resource development in the Canadian north
[AIAA PAPER 81-2640] A82-19215
Analysis of selected VTOL concepts for a civil transportation mission
[AIAA PAPER 81-2655] A82-19220
An investigation of automatic guidance concepts to steer a VTOL aircraft to a small aviation facility ship
[NASA-CR-152407] N82-16087
VHF OMNIRANGE NAVIGATION
Investigation of Wilcox model 585B very high frequency omnidirectional radio range (VOR) system, part 3
[AD-A107855] N82-17149
VHSIC (CIRCUITS)
Very high speed integrated circuits: Into the second generation. II - Entering Phase 1 A82-21848
VIBRATION DAMPING
Balancing of flexible rotors by the complex modal method
[ASME PAPER 81-DET-46] A82-19310
VIBRATION EFFECTS
Resonance tests on a Piper PA-32R tailplane before and after damage
[AD-A106273] N82-16071
VIBRATION MEASUREMENT
Measurement of the influence of flow distortions on the blade vibration amplitude in an air turbine
[ASME PAPER 81-DET-135] A82-19348
On-site vibration measurement, dynamic tracking and balancing A82-20545
Ice phobics blade tracking and comparison of vibration analysis techniques
[AD-A108121] N82-16074
VIBRATION METERS
On-site vibration measurement, dynamic tracking and balancing A82-20545
VIBRATION MODE
Modal analysis using helicopter dynamic test data
[ASME PAPER 81-DET-30] A82-19306
Investigation of vibration of shrouded turbine blades
[ASME PAPER 81-DET-129] A82-19343
A practical approach to systems mode analysis --- for disc-blade-shroud assemblies
[ASME PAPER 81-DET-130] A82-19344
An investigation of dual mode phenomena in a mistuned bladed-disk
[ASME PAPER 81-DET-133] A82-19347
Measurement of the influence of flow distortions on the blade vibration amplitude in an air turbine
[ASME PAPER 81-DET-135] A82-19348
A wind tunnel study of the flutter characteristics of a supercritical wing
[NLR-MP-81002-U] N82-17129
VIBRATION TESTS
Modal analysis using helicopter dynamic test data
[ASME PAPER 81-DET-30] A82-19306
VIBRATIONAL STRESS
Dynamic response of blades and vanes to wakes in axial turbomachinery
[ASME PAPER 81-DET-33] A82-19307
VISCOPLASTICITY
Research and development program for non-linear structural modeling with advanced time-temperature dependent constitutive relationships
[NASA-CR-165533] N82-16080
VISCOUS FLOW
Technical evaluation report of the AGARD Fluid Dynamics Panel Symposium on computation of viscous-inviscid interactions
[ONERA, TP NO. 1981-116] A82-19733
VISIBLE SPECTRUM
Spectrally balanced chromatic landing approach lighting system
[NASA-CASE-ARC-10990-1] N82-16059
VISION
The prevalence of visual deficiencies among 1979 general aviation accident airmen
[AD-A106489] N82-16054
VISUAL CONTROL
Spectrally balanced chromatic landing approach lighting system
[NASA-CASE-ARC-10990-1] N82-16059
VITRIFICATION
Development of in-can melting process and equipment, 1979 and 1980
[DE82-001050] N82-16834
VORTEX BREAKDOWN
Flow field around an oscillating airfoil A82-20813
VORTEX GENERATORS
Alleviation of the subsonic pitch-up of delta wings
[AIAA PAPER 82-0129] A82-22052
Experimental study of delta wing leading-edge devices for drag reduction at high lift --- conducted in Langley 7- by 10-foot high speed tunnel N82-17125
VORTEX SHEETS
Recent advances in applying Free Vortex Sheet theory to the estimation of vortex flow aerodynamics
[AIAA PAPER 82-0095] A82-22045
VORTICES
Aerodynamic characteristics of waveriders at subsonic flight speeds A82-19810
Recent advances in applying Free Vortex Sheet theory to the estimation of vortex flow aerodynamics
[AIAA PAPER 82-0095] A82-22045
Roll up model for rotor wake vortices, part 5
[ASRL-TR-194-4] N82-17127
Finite difference computation of the conical flow field over a delta wing
[VKI-TN-140] N82-17135
VORTICITY
Roll up model for rotor wake vortices, part 5 N82-17127
[ASRL-TR-194-4]
VORTICITY EQUATIONS
Steady and unsteady nonlinear hybrid vortex method for lifting surfaces at large angles of attack
[AIAA PAPER 82-0351] A82-22094
VULCANIZING
US Naval fleet aircraft corrosion N82-17350

W

WALL FLOW
End-wall boundary layer calculation methods N82-17188

This supplement is available as NTISUB 141 093 from the National Technical Information Service (NTIS), Springfield, Virginia 22161 at the price of $5.00 domestic; $10.00 foreign.

INTRODUCTION

Under the terms of an interagency agreement with the Federal Aviation Administration this publication has been prepared by the National Aeronautics and Space Administration for the joint use of both agencies and the scientific and technical community concerned with the field of aeronautical engineering. The first issue of this bibliography was published in September 1970 and the first supplement in January 1971.

This supplement to *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 418 reports, journal articles, and other documents originally announced in May 1982 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged in two major sections, *IAA Entries* and *STAR Entries*, in that order. The citations, and abstracts when available, are reproduced exactly as they appeared originally in *IAA* and *STAR*, including the original accession numbers from the respective announcement journals. This procedure, which saves time and money, accounts for the slight variation in citation appearances.

Three indexes -- subject, personal author, and contract number -- are included.

An annual cumulative index will be published.

A82-24005 # **Maintenance objectives for future aircraft.** J. G. Borger. *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 8 p.

Maintenance requirements for airline operations are discussed, noting the need for simpler designs which enhance maintenance procedures while still maintaining increasing fuel efficiency. Equipment redundancy is useful for safe operation with failed components, and modularizing aircraft parts has permitted on-line monitoring and replacement operations to maintain aircraft in flight-ready status with minimum delays due to repairs. The advent of advanced electronics has enhanced maintenance procedures in some cases, while in others the complexity of the monitoring system has led to greater down time. Higher performance engines degrade in performance after little more than a year's use, but refurbishment guided by high test stand acceptance standards, has improved engine removal rates. Finally, designing for reliability, ease of inspection and removal, and for in-flight potential problem indication are recommended. M.S.K.

A82-24006 # **Airworthiness regulation: What is our strategy - What are the issues.** M. C. Beard (FAA, Office of Airworthiness, Washington, DC). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 6 p.

The importance of international standards in the design, manufacture, and maintenance is stressed in view of the increase of the leasing, charter, and exchange of aircraft across national boundaries. Another trend noted in calling for international standards is the fact that the components of any given aircraft are, to an increasing extent, designed and manufactured in several different countries. C.R.

A82-24007 **Reliable power.** J. M. S. Keen (Rolls-Royce, Ltd., Derby, England). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 20 p.

Current Rolls-Royce engines are reviewed, with specific attention given to the implementation of a three-shaft concept for the modular development of engine thrust increases and fuel consumption decreases. The RB-211 three-shaft concept is reviewed, noting the development followed design goals of a short rigid engine with a minimum number of variables and cooled turbine stages. The E-4 engine employs a wide chord fan blade without snubbers and blends the turbine and bypass duct exhaust flows for passage through a single, final nozzle. Comprehensive access ports have been designed into the big fan engines, along with chip detectors in the oil system and vibration monitoring equipment for on-condition maintenance. Reliability management has resulted in the modular nature of the engines, featuring engine breakdown into separate, self-contained components, with comprehensive use records serving to notify when specific parts are due for inspection or replacement. M.S.K.

A82-24008 # **What the operator wants.** J. Meline. *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 6 p.

The design and manufacturing goals of aerospace industries for supplying airlines which have formed cooperative pools of maintenance and overhaul facilities and resources are examined. The manufacturers have gained feedback from the pooled labor forces who work on the increasingly standardized stocks of components in the common repair facilities, and are enabled to design-in improved features allowing easier and more thorough maintenance. Introduction of a new aircraft in any one fleet immediately introduces the vehicle to all maintenance personnel in the pool. The ATLAS group is noted to currently maintain a total fleet of 437 aircraft, and member agencies coordinate shared time to meet overhaul requirements. Differences in on-condition maintenance and overhaul grouping of work is described, and the benefits of pooling the most qualified personnel are emphasized. M.S.K.

A82-24009 # **The way ahead for helicopter maintenance.** W. E. Morris (Westland Helicopters, Ltd., Yeovil, Somerset, England). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 9 p.

The progress made by a British helicopter company in improving maintainability and reliability (M & R) is surveyed. Among the practices that have been found to be significant are the following: (1) maintaining a comprehensive data bank on M & R that is linked with customer data banks; (2) mathematical modeling of the life cycle costs; (3) improving the ability to diagnose sources of vibration without detriment to the operational availability of the helicopter; and (4) introducing check out systems that record in-flight defects and malfunctions, thereby simplifying maintenance programming. C.R.

A82-24010 # **The inter-relation between design, construction and maintenance.** J. M. Ramsden. *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 5 p.

Methods of improving inspection and maintenance procedures, especially to compensate for an emphasized rise in poor workmanship during construction phases, are outlined. An improvement in detail design, to simplify and correctly place aircraft components, is recommended, as is better education of specialists in features of fasteners and electronics. On-line monitoring has become possible with self-checking, multiple probes for nearly all functional on-board equipment. The need to improve tires and brake systems to cope with increasing landing weights and speeds is noted, as is a necessity to integrate electronic systems and provide protection from disconnects due to the operating environment. Further suggestions are made for the elimination of corrosion, improvements in inspectability, and the need to measure in-service aerodynamics, and the demise of the U.S. Civil Aeronautics Board is mentioned as an erosion of the airline industry's data base. M.S.K.

A82-24011 # **MSG-3 structures.** S. Schofield (British Airways, Hounslow, Middx., England). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 5 p.

The paper describes the philosophy and methodology used to develop the aircraft structures maintenance program contained and recently published in the ATA Airline/Manufacturer Maintenance Program Planning Document MSG-3. Particular consideration is given to the evolution of a separate logic analysis for structures; the consequence of failure evaluation; the separate assessment of the different forms of structural damage; the detectability of damage; the establishment of a continuing structural program for the life of the aircraft; fleet leader/age exploration inspections and the role of the manufacturer in the continuing structure program. B.J.

A82-24012 # **Monitoring engine wear by oil analysis.** D. F. Sermin (Applied Research Laboratories of Florida, Inc., Hialeah, FL). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 5 p.

The application of spectroscopic techniques to the detection of metal particles in engine oils as an identifier and predictor of specific component wear and incipient failure is described. The current rotrode technique involves physically taking an oil sample for electrical discharge vaporization and subsequent spectrography. A succeeding step identifies the concentration computer calibrated graph. Inaccuracies in the method had led to the development of wear element contraction determination by the use of inductively coupled plasma excitation. The sample is introduced to the plasma within a quartz tube surrounded by a coil of wire which creates the magnetic field. The oil is nebulized and passed through a tube into the plasma, where the atoms dissociate and create individual optical spectra in the 7000-10,000 K heat. The method yields results within 1% of the signal value detected, or within 1 ppm. M.S.K.

A82-24014 # **MSG-3 overview.** R. Valeika (Pan American World Airways, Inc., New York, NY). *International Aircraft Maintenance Engineering Exhibition and Conference, Zurich, Switzerland, Feb. 10-12, 1981, Paper.* 4 p.

The paper surveys experience with programs developed in the framework of the ATA Airline/Manufacturer Maintenance Program Planning Document MSG-3. After a brief review of experience with MSG-1/2, attention is given to MSG-3 development, and to maintenance programs developed for systems, powerplants, and structures within the MSG-3 context. B.J.

A82-24022 * # **Minimum mass sizing of a large low-aspect ratio airframe for flutter-free performance.** W. H. Greene and J. Sobieszczanski-Sobieski (NASA, Langley Research Center, Hampton, VA). *(AIAA, ASME, ASCE, and AHS, Structures, Structural Dynamics and Materials Conference, 21st, Seattle, WA, May 12-14, 1980, AIAA Paper 80-0724.) Journal of Aircraft*, vol. 19, Mar. 1982, p. 228-234. 12 refs.

A procedure for sizing an airframe for flutter-free performance is demonstrated on a large, flexible supersonic transport aircraft. The procedure is based on using a two-level reduced basis or modal technique for reducing the computational cost of performing the repetitive flutter analyses. The supersonic transport aircraft exhibits complex dynamic behavior, has a well-known flutter problem and requires a large finite-element model to predict the vibratory and flutter response. Flutter-free designs are produced with small mass increases relative to the wing structural weight and aircraft payload. In view of the ability of the resizing procedure to handle this supersonic transport configuration, it seems likely that the method could be used for many other aircraft. (Author)

A82-24023 # **Static pressure in the slipstream of a propeller.** G. Schouten (Delft, Technische Hogeschool, Delft, Netherlands). *Journal of Aircraft*, vol. 19, Mar. 1982, p. 251-253. 9 refs.

Prompted by the paradoxical implication of existing theory that static pressure in the slipstream of an active propeller would exceed the static pressure in the fluid outside the slipstream, a consistent theory is developed which yields a static pressure more plausibly tending to the freestream pressure. The theory adapts the flat trailing vortex sheet model to a propeller with a finite number of blades which moves at a finite velocity. O.C.

A82-24025 **Air transport in the 21st century.** K. G. Wilkinson. *Aerospace* (UK), vol. 9, Jan. 1982, p. 18-23. 8 refs.

Trends in aircraft design into the 21st century are discussed, based on the driving need for higher fuel efficiency and alternative fuels. Noting that fuel presently accounts for 30% of air transportation, results of an international study on the world energy supply and growth are used to present several scenarios of future aerospace operations. Global energy is projected to be provided from renewables and nuclear, coal and gas, and oil, each group producing 1/3 of the world energy demands, with aerospace consuming 3% of the total oil consumed. Advances in aerodynamics from NASA studies, in lightweight synthetic materials, in active controls, and in propulsion systems are outlined, with mention made of the CO2 contribution to a global rise in temperature. The development of nuclear technology and the availability of nuclear fuels is contrasted against the environmental costs of using hydrocarbon fuels, and the necessity of developing a hydrogen-based fuel economy is emphasized. M.S.K.

A82-24065 **Navigational aids on-board the Concorde (Les moyens de navigation du Concorde).** F. Vicens (Compagnie Nationale Air France, Paris, France). *Navigation (Paris)*, vol. 30, Jan. 1982, p. 25-39. In French.

The differences of navigational instrumentation on the Concorde from subsonic aircraft due to transonic and supersonic flight regimes are described. Speed classes at different heights are defined for optimal flight operations, with each minute of error from the most direct route causing an extra 100 kg of fuel to be consumed. The Concorde is equipped with an inertial navigation system (INS), automatic direction finder, distance measuring equipment, VOR, and a ground warning system. The INS gathers altitude information, guidance and navigation data, and coupled compass stabilization information with reference to the magnetic pole. The Air Data Computer gathers aerodynamic and meteorological information, including altitude and vertical airspeed, from sensors mounted on the nose, and further guidance is aided by radio compass readings (Automatic Directional Finder) and two systems of radio altimetry. M.S.K.

A82-24066 **The birth of precision DME (La naissance du DME de précision).** O. Carel (Direction Générale à l'Aviation Civile, Paris, France). *Navigation (Paris)*, vol. 30, Jan. 1982, p. 53-65. 6 refs. In French.

The requirements, design, and deployment of precision distance measuring equipment (DME) for implementation at French civil airports is described. The system is intended to equal the performance levels of military landing systems, and furnish coordinates at 20 nm distance with a landing aperture of plus or minus 80 deg. The DME permits curved approaches, thereby ameliorating flights over some urban areas, and offers the possibility of totally replacing radioaltimetry as an approach guide. Polar coordinates are transmitted with an accuracy of 250 m, which is matched by the transverse accuracy, while altimeter readings are made with a 30 m error. Methods of obtaining the precision measurements are presented, along with analyses of exponential damping, fabrication of the system, the presence of second or third impulses, and methods of interlocking the impulses, along with a demonstration of a 200 channel dual mode system. M.S.K.

A82-24077 # **Recent developments in wing with stores flutter suppression.** R. Destuynder (ONERA, Châtillon-sous-Bagneux, Hauts-de-Seine, France). *(Deutsche Gesellschaft für Luft- und Raumfahrt and Deutsche Forschungs- und Versuchsanstalt für Luft- und Raumfahrt, International Symposium on Aeroelasticity, Nuremberg, West Germany, Oct. 5-7, 1981.) ONERA, TP* no. 1981-145, 1981. 11 p.

Active flutter suppression calculations and wind tunnel tests were performed for the case of a half-scale model of the Mirage F-1 fighter wing, equipped with three underwing stores whose distribution has been modified to make flutter occur in the wind tunnel's Mach 0.80-0.94 transonic regime. Flutter control was achieved with a numerical control law designed to induce wing aerodynamic stiffness by means of a control surface. Further studies were conducted on nonlinearities due to the static aerodynamic characteristics of the control surface at high subsonic Mach numbers, and the influence of phase and gain variations on the control law. The results derived demonstrate the possibility of flutter control on military aircraft operating at high Mach numbers. O.C.

A82-24245 **Recent improvements in aircraft Ni-Cd cells.** R. Bonnaterre, J. Leonardi, and P. Oliva (Société des Accumulateurs Fixes et de Traction, Bordeaux, France). In: Power sources 8: Research and development in non-mechanical electrical power sources; Proceedings of the Twelfth International Symposium, Brighton, England, September 1980. London, Academic Press, 1981, p. 459-468; Discussion, p. 469.

It is noted that the reliability, power performance, and durability of the alkaline Ni-Cd batteries used in such advanced technical fields as aeronautics and high-speed trains are becoming increasingly important. A new aircraft battery generation created to respond to such requirements is described. Increased reliability and durability result from the development and use of a new graft copolymer membrane, the properties of which are discussed. The use of the new membrane and the optimization of the electromechanical parameters of the cell design have significantly improved the power characteristics of Ni-Cd aircraft batteries. In particular, eliminating the 'potential well' phenomenon in low-temperature, high-rate discharges has led to substantial power gains for low-temperature aircraft starts. C.R.

A82-24301 **Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings.** Conference sponsored by the Society of British Aerospace Companies. London, Society of British Aerospace Companies, Ltd., 1981. 713 p. $59.50.

Among the aircraft transparency design, testing and analysis topics covered are: (1) transparency development needs for military aircraft in the 1980s, (2) an aircraft transparency design guide, (3) deficiencies and constraints affecting the design of cockpit transparencies and enclosures, (4) bird strikes, (5) windshield system structural enhancement, (6) aircraft transparency bird impact analysis using the MAGNA computer program, (7) stretched acrylic transparency materials, (8) transport aircraft transparencies, and (9) impact resistance test methods. Also considered are (10) abrasion-resistant coatings for aircraft, (11) the role of finite element analysis in the design of birdstrike-resistant transparencies, and (12) the effects of bird orientation on load profile and damage level. O.C.

A82-24302 **Transparency development needs for military aircraft in the 1980's.** N. C. Moore. In: Conference on Aerospace develop; however, its productivity reduces test costs significantly, thereby offsetting increased model costs. (Author)

A82-24674 * # **Structural modeling of high Reynolds number wind tunnel models.** S. C. Mehrotra (Vigyan Research Associates, Inc., Hampton, VA) and J. C. Robinson (NASA, Langley Research Center, Hampton, VA). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 239-245. Contract No. NAS1-16114. (AIAA 82-0602)

A solid uninstrumented wing and a pressure instrumented wing having a tongue and groove type joint have been structurally modeled by using SPAR Structural Analysis System. The solid wing model can be analyzed by SPAR, using either solid elements or plate elements with reasonable accuracy. The instrumented wing models with tongue and groove joint can be modeled by using solid elements. A solid model representation for the wing with tongue and groove joint can be used for the cases where an error of 6 percent in deflections is acceptable. (Author)

A82-24675 * # **Evaluation of methods for characterizing surface topography of models for high Reynolds number wind-tunnels.** E. C. Teague, T. V. Vorburger, F. E. Scire, S. M. Baker, S. W. Jensen (National Bureau of Standards, Washington, DC), B. B. Gloss (NASA, Langley Research Center, Hampton, VA), and C. Trahan. In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 246-251. 6 refs. NASA Order L-4718-B. (AIAA 82-0603)

Current work by the National Bureau of Standards at the NASA National Transonic Facility (NTF) to evaluate the performance of stylus instruments for determining the topography of models under investigation is described along with instrumentation for characterization of the surface microtopography. Potential areas of surface effects are reviewed, and the need for finer surfaced models for the NTF high Reynolds number flows is stressed. Current stylus instruments have a radii as large as 25 microns, and three models with surface finishes of 4-6, 8-10, and 12-15 micro-in. rms surface finishes were fabricated for tests with a stylus with a tip radius of 1 micron and a 50 mg force. Work involving three-dimensional stylus profilometry is discussed in terms of stylus displacement being converted to digital signals, and the design of a light scattering instrument capable of measuring the surface finish on curved objects is presented. M.S.K.

A82-24676 * # **Status and capabilities of the National Full Scale Facility 40- by 80-foot wind tunnel modification.** K. W. Mort, D. F. Engelbert, and J. C. Dusterberry (NASA, Ames Research Center, Moffett Field, CA). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 252-272. 30 refs. (AIAA 82-0607)

The background, requirements, and aerodynamic design of the modified NASA Ames 40 x 80 ft wind tunnel are reviewed, along with the systems integration and systems test results. Advancing vehicle sizes and airspeeds required a larger wind tunnel test section and a capability for 100 and 300 knots airspeed simulation. Acoustic mufflers at the inlet and exit of the nonreturn circuit provide noise suppression. The enlarged test section is intended to accomodate the complex flowfields of wings with high lift coefficients, and the drive system is designed with minimum residual swirl. Features of the fan blades are examined, along with characteristics of the test channels, control vanes and louvers, the exit, circuit losses, temperature rises during operation of the nonreturn circuit, and the facility acoustics. Specific construction problems and solutions for the conversion process are outlined, and it is noted that operational status is expected at the end of 1982. M.S.K.

A82-24677 * # **A new facility and technique for two-dimensional aerodynamic testing.** J. B. McDevitt, T. E. Polek, and L. A. Hand (NASA, Ames Research Center, Moffett Field, CA). In: Aerodynamic Testing Conference, 12th, Williamsburg, VA, March 22-24, 1982, Collection of Technical Papers. New York, American Institute of Aeronautics and Astronautics, 1982, p. 273-295. 6 refs. (AIAA 82-0608)

The design and operational characteristics of a new test leg for the High Reynolds Number Facility at Ames Research Center are presented, and the unique features of a test section for obtaining two-dimensional airfoil data are reviewed. The new facility operates at unit Reynolds numbers ranging from 1,000,000/ft to 30,000,000/ft. Boundary-layer suction panels are used in the test section (16 in. wide by 24 in. high) to minimize side-wall interference effects. Flexible, easily adjustable upper and lower walls allow test-channel area-ruling so as to nullify Mach-number changes induced by mass removal, to correct for longitudinal boundary-layer growth, and to provide contouring compatible with the streamlines of the model in free air. (Author)

A82-24701 **The Agusta's solution of AHS's hypothetical fatigue life problem.** G. Aldinio and P. Alli (Costruzioni Aeronautiche Giovanni Agusta S.p.A., Gallarate, Italy). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 15 p. 8 refs.

The Agusta solution to the American Helicopter Society's hypothetical fatigue life problem is presented. The fatigue analysis methodology for dynamic components is based on Miner's rule, which necessitates a proper load survey and some fatigue tests. The component's life is calculated using peak value flight loads, cycle-counted flight loads, the rainflow method, the range-pair-range method, and counting methods. GAG cycles are also discussed. D.L.G.

A82-24703 **The challenge of standardizing fatigue methodology.** B. Altman and J. Pratt (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 14 p. 7 refs.

The Sikorsky methodology is described, and the goal of standardization of fatigue methodology as applied to a hypothetical fatigue problem is discussed. Areas that can be successfully standardized include S/N curve shapes for specific materials, the use or non-use of Goodman corrections, the selection of test steady loads, and the determination of primary frequency. It is concluded that the success with which standardization will set the balance between structural reliability and program costs will depend upon the assessment of the risks involved for the total methodology; a system approach is needed to understand and optimize the risks involved in the total methodology selected and the program advantages. D.L.G.

A82-24704 **Standardization of helicopter fatigue methodology - A manufacturer's view.** J. M. Drees (Bell Helicopter Textron, Fort Worth, TX). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 11 p.

It is pointed out that each helicopter company has its own way of determining component lives. As the existence of such differences has created problems for the Army evaluation teams, it has been recommended that standardization of methods be imposed by the Army for future developments. The present investigation is concerned with the question of whether standardization beyond what has already been specified is beneficial from an overall standpoint. It is found that there are a number of aspects which make it difficult to recommend at the present time the introduction of new industry-wide standards. Thus, it appears unlikely that safety will be improved by such standards, because many field failures are caused by factors which are not part of the methodology presently followed. The recommendation is made that an independent 'Helicopter Fatigue Methodology Council' be formed. Feasibility of standardization may be explored as well as many other subjects of common interest during workshop-type meetings. G.R.

A82-24705 **Application of fatigue, crack propagation and strain survey testing to the CH-46 aft rotor drive shaft.** H. S. Faust (Boeing Vertol Co., Philadelphia, PA). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 18 p.

A fatigue cracking problem in the aft rotor drive shaft of the CH-46 helicopter is described. The cracking occurred in a pinned joint between two sections of the shaft, at service times below the retirement life indicated by the original fatigue test and life calculations. Crack propagation and strain survey tests are discussed together with their use in defining periodic inspection intervals and joint improvements. In addition, a new stress analysis technique for joints of this type is introduced. (Author)

A82-24706 **Evolution of the Aeroscout.** G. Fossum, II (U.S. Army, Training and Doctrine Command, Fort Monroe, VA). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 7 p.

The development of the aerial scout is discussed, taking into account medical evacuation roles assigned to the first helicopters purchased by the Army, the role of the helicopter during the Korean War, the scout/gunship role for the OH-13 helicopter, and scout missions performed in Vietnam. The adaption of helicopter scout tactics for modern combat conditions is considered, giving attention to the need to increase the helicopter's survivability on the mid to high intensity battlefield. The present concept of scout employment calls for the scout to be the integrator of aerial antiarmor firepower of the combined arms team. Four major roles identified are related to operations as air cavalry scout, attack helicopter scout, artillery scout, and an aid to battlefield management. G.R.

A82-24707 **Flight test data acquisition and interpretation.** C. Hutchinson and H. Steinmann (Boeing Vertol Co., Philadelphia, PA). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 18 p.

Data acquisition comprises the selection of measurements, optimization of recording methods, and processing of the measurements for interpretation. Basic measurements are related to the determination of airspeed, altitude, gross weight, the center of gravity, rotor speed, outside air temperature, attitudes, rates, stick positions, and load factor. The complete list of the parameters is dependent on the type of helicopter being tested. However, the intent is to be able to verify the suitability of maneuvers for the flight load survey requirements. Data interpretation considers safety of the test aircraft, load studies, and fatigue life predictions. Variations in operating restrictions, based on fatigue loads, can have dramatic effects on the outcome of the fatigue life assessment. G.R.

A82-24708 **Structural testing of composites with known defects.** P. F. Maloney (Kaman Aerospace Corp., Bloomfield, CT). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 14 p. 5 refs.

In connection with the application of composite materials in primary structural components of production aircraft, an understanding of the significance of typical defects in the material is very important. The present investigation has the objective to make a contribution to such an understanding. Specific experiences discussed are derived from four separate development programs of relatively recent completion. Attention is given to the composite main rotor blade for the AH-1 Cobra helicopter, the composite rotor hub development program, the composite main rotor blade for the circulation control rotor, and the development of a composite blade for a 300 foot diameter wind turbine. A description is presented of salient features of each of these programs, taking into account significant findings relative to defects as they may affect composite materials. G.R.

A82-24709 **A method of determining safe service life for helicopter components.** G. W. McCloud (Bell Helicopter Textron, Fort Worth, TX). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 12 p.

It is pointed out that the considered methods have been used by an American helicopter manufacturer for many years and were found to be reliable. In general, these methods follow those outlined in FAA Advisory Circular 20-95. The information required for the determination of the fatigue life of a component includes the fatigue strength characteristics of the component, the stresses associated with normal flight maneuvers, and the frequency of occurrence of those maneuvers. Attention is given to the approaches employed to obtain information regarding the fatigue strength, the operating loads spectrum, a fatigue life calculation, and prospects for improving state-of-the-art procedures. G.R.

A82-24710 **Hughes helicopters - Fatigue life methodology.** J. McDermott (Hughes Helicopters, Inc., Culver City, CA). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 20 p.

A description is presented of the approach used by an American helicopter manufacturer in solving a hypothetical fatigue problem. The solution of the problem was undertaken to identify and evaluate the different methodologies existing in the industry. The hypothetical fatigue problem provides loads data, fatigue test data, and defines the spectrum. The required solutions include the calculation of fatigue life using cycle counted data, the calculation of fatigue life using peak loads applied throughout the time slice of duration of maneuver, and the determination of the effect of GAG cycles. The results of the investigation show the importance of the determination of the S-N curve, using either best data fit or standard material curve shape. Assumption of peak cycle loads for duration of maneuver is found to be ultra conservative, leaving out the GAG cycle is unconservative. G.R.

A82-24712 **Flight condition recognition /FCR/ technique.** D. M. Saylor (U.S. Army, Research and Technology Laboratories, Fort Eustis, VA). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 7 p.

A U.S. Army contract, entitled 'Structural Integrity Monitoring System' was performed to design, qualify, flight test, and demonstrate the Structural Integrity Recording System (SIRS). SIRS provides a cost-effective method of tracking the accumulation of fatigue damage on critical helicopter dynamic components. The system monitors the variations in fleet utilization on a helicopter-by-helicopter basis for safer and more economical operation. SIRS is a total system comprising an airborne microprocessor-based recorder, a portable flight-line retrieval unit, and a data processing package. Attention is given to the airborne recorder, the transducer package, the retrieval unit, fatigue damage assessment software, flight test programs, aspects of operational test and evaluation, and a flight test program. G.R.

A82-24713 **NDE of composite rotor blades during fatigue testing.** R. Shuford, W. Houghton (U.S. Army, Army Materials and Mechanics Research Center, Watertown, MA), J. R. Mitchell (Becton, Dickinson and Co., Dunegan-Endevco, San Juan Capistrano, CA), and J. W. Sobczak (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 17 p. 11 refs.

A description is presented of progress made in a continuing project concerned with the evaluation of the usefulness of several nondestructive evaluation (NDE) techniques for monitoring flaw initation and growth in composite helicopter rotor blades. The acoustic emission (AE) results indicate minor fatigued damage. It appears, therefore, feasible to project an AE failure curve based on the emissions from periodic proof overloads. This technique could have wide application in new product certification and in-service inspection of composite rotor blades. Indications from the vibrothermography portion of the program suggest that it may provide an excellent method for locating, characterizing, and understanding defect development and growth during cyclic loading of composite structures. Results from the ultrasonic, radiographic and visual examinations indicate that these procedures are very useful for the evaluation of defects in composite rotor blades. G.R.

A82-24714 **Fundamentals of helicopter fatigue life determination.** D. P. Schrage (U.S. Army, Aviation Research and Development Command, St. Louis, MO). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 28 p. 10 refs.

This paper reviews the fundamentals of helicopter fatigue life determination by discussing the sources and definitions of helicopter loads, the relationships between these loads and critical stresses, and helicopter fatigue methodology. Helicopter fatigue methodology is the process by which the various aspects and disciplines are incorporated into a procedure for calculating helicopter fatigue lives. (Author)

PROPULSION SYSTEM CONFIGURATIONS
Helicopter propulsion systems: Past, present and future N82-17204
Aircraft turbine engine development: Current practices and new priorities N82-17206
Future technology and requirements for helicopter engines N82-17207
Advanced component development design basis for next generation medium power helicopter engines N82-17209
Component research for future propulsion systems N82-17224
Future requirements for helicopter propulsion systems N82-17225

PROPULSION SYSTEM PERFORMANCE
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation
[AIAA PAPER 81-2663] A82-19221
Operational and performance aspects of fuel management in civil aircraft A82-20518
Advanced subsonic transport propulsion
[AIAA PAPER 81-0811] A82-20874
Propulsion system controls design and simulation
[AIAA PAPER 82-0322] A82-22091
Influence of correlations and computational methods on the prediction of overall efficiency N82-17180
Survey on the effect of blade surface roughness on compressor performance N82-17191
Axial compressor stall and surge N82-17194
Helicopter propulsion systems: Past, present and future N82-17204
Aircraft turbine engine development: Current practices and new priorities N82-17206
Future technology and requirements for helicopter engines N82-17207
Mechanical advances in the design of small turboshaft engines N82-17208
Advanced component development design basis for next generation medium power helicopter engines N82-17209
Aerodynamic components for small turboshaft engines N82-17211
Regenerative helicopter engines: Advances in performance and expected development problems N82-17212
Advanced transmission component development N82-17214

Helicopter propulsions systems. 1: Vibration prevention systems on helicopters 2: Problem of noise in the cabin
N82-17222

PROPULSIVE EFFICIENCY
The design of compact asymmetric maximum-thrust nozzles for a given lift force
A82-19614

Design possibilities for improved fuel efficiency of civil transport aircraft
A82-20514

Airbus Industrie - The year of progress
A82-21189

Mechanical advances in the design of small turboshaft engines
N82-17208

The distress regime on the bimotored helicopter
N82-17219

PROTECTIVE COATINGS
Corrosion prevention measures used in the construction of an aircraft airframe: The case of 2014 and 2214 alloys
N82-17360

Recent developments in materials and processes for aircraft corrosion control
N82-17361

New concepts in multifunctional corrosion for aircraft and other systems
N82-17362

Corrosion in naval aircraft electronic systems
N82-17363

Corrosion protection schemes for aircraft structures: Some examples for the corrosion behaviour of Al alloys
N82-17364

PROTOTYPES
A progress report on the European Transonic Wind Tunnel Project
[ONERA, TP NO. 1981-121]
A82-19737

PSEUDORANDOM SEQUENCES
Land navigation with a low cost GPS receiver
A82-20656

PULSE COMPRESSION
Sanctuary radar --- with digital processor for Doppler filtering and pulse compression
A82-18906

Q

QUALITY CONTROL
Computer graphics for quality assurance
A82-20276

Operability of military aircraft - Some design and cost trends
A82-20565

QUIET ENGINE PROGRAM
Quiet Short-Haul Research Aircraft - The first 3 years of flight research
[AIAA PAPER 81-2625]
A82-19209

R

RADAR ANTENNAS
L-band power generation in the General Electric solid-state radar
A82-18914

Analysis and tolerance study of an array antenna for a new generation of secondary radars
A82-19521

RADAR APPROACH CONTROL
L-band power generation in the General Electric solid-state radar
A82-18914

Airport radar systems --- Russian book
A82-18975

Survey of 101 US airports for new multiple instrument approach concepts --- runways
[AD-A107812]
N82-17229

RADAR ATTENUATION
X-band vs C-band aircraft radar - The relative effects of beamwidth and attenuation in severe storm situations
A82-19858

RADAR BEACONS
ATCRBS uplink environment measurement near Jacksonville, Florida
[AD-A108053]
N82-16063

Active beacon collision avoidance logic evaluation. Volume 2: Collision avoidance (BCAS) threat phase
[AD-A107805]
N82-17148

RADAR BEAMS
Analysis and tolerance study of an array antenna for a new generation of secondary radars
A82-19521

RADAR EQUIPMENT
Airport radar systems --- Russian book
A82-18975

Radar environment simulation for software test
A82-19245

Simulation of modern radar installations in full-mission flight and tactics simulators
[DGLR PAPER 81-103]
A82-19272

RADAR HOMING MISSILES
Microwave systems for radar guided missiles
A82-18936

RADAR MAPS
Simulation of modern radar installations in full-mission flight and tactics simulators
[DGLR PAPER 81-103]
A82-19272

RADAR MEASUREMENT
Airborne lidar measurements of smoke plume distribution, vertical transmission, and particle size
A82-21386

RADAR SCATTERING
Modelling of target radar scattering with application to guidance simulation
A82-20570

Comparison of various elevation angle estimation techniques
A82-20589

RADAR TARGETS
Tactical Radar Threat Generator system
A82-18903

Design criteria for a miss distance radar
A82-18904

Modelling of target radar scattering with application to guidance simulation
A82-20570

RADAR TRACKING
Tactical Radar Threat Generator system
A82-18903

Microwave communications to remotely piloted vehicles
A82-18911

Experimental measurement of the low angle terrain scattering interference environment
A82-20588

Comparison of various elevation angle estimation techniques
A82-20589

Tracking of low-altitude targets by a combined X/Ka-band radar system
A82-20590

RADAR TRANSMITTERS
L-band power generation in the General Electric solid-state radar
A82-18914

RADIANT FLUX DENSITY
Fuel property effects on radiation intensities in a gas turbine combustor
A82-19966

RADIO BEACONS
Investigation of Wilcox model 585B very high frequency omnidirectional radio range (VOR) system, part 3
[AD-A107855]
N82-17149

RADIO FREQUENCY INTERFERENCE
Experimental measurement of the low angle terrain scattering interference environment
A82-20588

RADIO NAVIGATION
The influence of technology advances on integrated CNI avionics --- Integrated Communication, Navigation, and Identification Avionics for military aircraft
A82-20672

RADIO RECEIVERS
Land navigation with a low cost GPS receiver
A82-20656

RADIO RELAY SYSTEMS
Relay-augmented data links in an interference environment
A82-20684

WALL PRESSURE
A new method of estimating the lateral wall effect on the airfoil incidence due to the suction at side walls N82-17123
[NAL-TR-680]
WARFARE
SIMATH - An air battle simulation of the USAF Tactical Air Control System /TACS/ with Advanced Tactical Radars A82-19256

WARHEADS
Analysis methods for predicting structural response to projectile impact N82-17162

WARNING SYSTEMS
Aircraft alerting systems standardization study. Volume 2: Aircraft alerting system design guidelines N82-16077
[AD-A106732]
Active beacon collision avoidance logic evaluation. Volume 2: Collision avoidance (BCAS) threat phase N82-17148
[AD-A107805]
WASTE DISPOSAL
Development of in-can melting process and equipment, 1979 and 1980 N82-16834
[DE82-001050]
WASTE TREATMENT
Development of in-can melting process and equipment, 1979 and 1980 N82-16834
[DE82-001050]
WATER
The use of Doppler spectroscopy to study the characteristics of the polydisperse characteristics of emulsion water and solid microimpurities in aviation fuels A82-22198

An airline view of the corrosion problem N82-17352

The experience of corrosion on French military aerodynes N82-17355

WATERPROOFING
Recent developments in materials and processes for aircraft corrosion control N82-17361

WAVE REFLECTION
Ground reflection effects in aircraft noise measurements A82-19970

WAVEGUIDE ANTENNAS
Leaky wave antenna using an inverted strip dielectric waveguide --- for aircraft application A82-19552

WEAPON SYSTEMS
Tactical Radar Threat Generator system A82-18903

ASW and weapon system simulation with reference to the Nimrod MR Mk2 maritime crew trainer A82-20531

WEAPONS DELIVERY
Recent developments in military telemetry A82-18908

Application of thrust vectoring for STOL A82-19205
[AIAA PAPER 81-2616]
WEAR TESTS
Corrosion fatigue behaviour of some aluminium alloys N82-17345

Flight-by-flight corrosion fatigue tests N82-17348

WEATHER FORECASTING
FAA/NWS aviation route forecast /ARF/ development A82-22027
[AIAA PAPER 82-0013]
Aircraft icing avoidance and protection N82-17139
[PB82-108135]
WEIGHT REDUCTION
Optimal shape design of turbine blades A82-19342
[ASME PAPER 81-DET-128]
Power system design optimization using Lagrange multiplier techniques A82-20743

Boeing's bigger narrowbody A82-21190

WIDEBAND COMMUNICATION
The influence of technology advances on integrated CNI avionics --- Integrated Communication, Navigation, and Identification Avionics for military aircraft A82-20672

WIND EFFECTS
Optimal dolphin hang glider flight N82-17157

WIND PROFILES
Numerical and flight simulator test of the flight deterioration concept N82-16655
[NASA-CR-3500]
WIND SHEAR
Systems approach to the design of wind shear avionics A82-21593

Numerical and flight simulator test of the flight deterioration concept N82-16655
[NASA-CR-3500]
WIND TUNNEL APPARATUS
A progress report on the European Transonic Wind Tunnel Project A82-19737
[ONERA, TP NO. 1981-121]
A versatile data acquisition system for a low speed wind tunnel N82-16097
[AD-A106269]
A durable, intermediate temperature, direct reading heat flux transducer for measurements in continuous wind tunnels N82-17483
[AD-A107729]
WIND TUNNEL CALIBRATION
Calibration of the Ames Anechoic Facility. Phase 1: Short range plan N82-16091
[NASA-TM-84081]
WIND TUNNEL MODELS
Some experimental investigations on transonic flutter characteristics of thin plate wing models with sweptback and tapered tips N82-16050
[NAL-TR-682]
WIND TUNNEL TESTS
Large-scale wind tunnel tests of a sting-supported V/STOL fighter model at high angles of attack A82-19208
[AIAA PAPER 81-2621]
Low speed testing of the inlets designed for a tandem-fan V/STOL nacelle A82-19210
[AIAA PAPER 81-2627]
Airframe effects on top-mounted inlet systems for VSTOL fighter aircraft A82-19212
[AIAA PAPER 81-2631]
Thrust modulation methods for a subsonic V/STOL aircraft A82-19213
[AIAA PAPER 81-2633]
Design features of a sea-based multipurpose V/STOL, STOVL, and STOL aircraft in a support role for the U.S. Navy A82-19218
[AIAA PAPER 81-2650]
Subsonic and transonic roll damping measurements on Basic Finner --- finned missile calibration model A82-19958

Ultrasonic method for flow field measurement in wind tunnel tests A82-20054

Alleviation of the subsonic pitch-up of delta wings A82-22052
[AIAA PAPER 82-0129]
Isolated nacelle performance - Measurement and simulation A82-22054
[AIAA PAPER 82-0134]
Aerodynamic characteristics of airfoils with ice accretions A82-22081
[AIAA PAPER 82-0282]
Store separation from cavities at supersonic flight speeds A82-22096
[AIAA PAPER 82-0372]
Aerodynamic characteristics of maneuvering flaps A82-22110

Aerodynamic evaluation of winglets for transport aircraft A82-22245
[AIAA PAPER 81-1215]
Summary of theoretical considerations and wind tunnel tests of an aerodynamic spoiler for stall proofing a general aviation airplane N82-16046
[NASA-CR-165100]
Some experimental investigations on transonic flutter characteristics of thin plate wing models with sweptback and tapered tips N82-16050
[NAL-TR-682]
Study of controlled diffusion stator blading. 1. Aerodynamic and mechanical design report N82-16081
[NASA-CR-165500]

Comparison of acoustic data from a 102 mm conic nozzle as measured in the RAE 24-foot wind tunnel and the NASA Ames 40- by 80-foot wind tunnel [NASA-TM-81343] N82-16083
Experimental verification of an aerodynamic parameter optimization program for wind tunnel testing [AD-A107727] N82-17134
A velocity vector measuring system with 13 asymmetric wedge type yawmeters --- measuring flow distribution around the empennage of STOL models [NAL-TR-674] N82-17477

WIND TUNNELS
Calibration of the Ames Anechoic Facility. Phase 1: Short range plan [NASA-TM-84081] N82-16091
A versatile data acquisition system for a low speed wind tunnel [AD-A106269] N82-16097

WINDMILLS (WINDPOWERED MACHINES)
Rotor model for the verification of computational methods [ISD-275] N82-17638
Static investigations of rotor blades under deadweight and during stationary operation [ISD-269] N82-17639
Stability and response to gravity of the flap lag motion for a rigid rotor blade with flap-pitch coupling [ISD-270] N82-17640
Dynamic analysis of a rotor blade with flap and lag freedom and flap-pitch coupling [ISD-271] N82-17641
Static and dynamic investigations for the model of a wind rotor [ISD-272] N82-17642

WINDPOWERED GENERATORS
Loading cycles and material data for the layout of a wind turbine of special hub concept [ISD-273] N82-17643

WING CAMBER
Experimental trim drag values for conventional and supercritical wings [NASA-CR-168500] N82-17126

WING LOADING
Wing-canard aerodynamics at transonic speeds - Fundamental considerations on minimum drag spanloads [AIAA PAPER 82-0097] A82-22046
Integration of a code for aeroelastic design of conventional and composite wings into ACSYNT, an aircraft synthesis program --- wing aeroelastic design (WADES) [NASA-CR-137805] N82-16069
Ground calibration of a strain-gauged CT-4A aircraft (1979) [AD-A107847] N82-16073

WING NACELLE CONFIGURATIONS
Transonic perturbation analysis of wing-fuselage-nacelle-pylon configurations with powered jet exhausts [AIAA PAPER 82-0255] A82-22077

WING OSCILLATIONS
A simplified wing procedure in connection with the lifting line theory and the doublet-lattice method A82-19195
The velocity potential for the harmonically oscillating, rectangular wing with semiinfinite span in nonlinear theory A82-19198
Unsteady lifting-line theory with applications [AIAA PAPER 82-0354] A82-19798
Flow field around an oscillating airfoil A82-20813
Numerical calculation of lift, moment coefficient and dynamic stability derivatives on sideslipping wings in unsteady supersonic flows A82-22111

WING PANELS
Bolted field repair of graphite/epoxy wing skin laminates A82-20981

WING PLANFORMS
A simplified wing procedure in connection with the lifting line theory and the doublet-lattice method A82-19195
Numerical solution of three-dimensional unsteady transonic flow over wings including inviscid/viscous interactions [AIAA PAPER 82-0352] A82-19797
Blade planform for a quiet helicopter [NASA-CR-166256] N82-17121

WING PROFILES
Analysis of an ideal-fluid flow past a finite-thickness wing A82-19813
High angle-of-attack characteristics of three-surface fighter aircraft --- canard-wing-horizontal tail configuration for greater stability and control [AIAA PAPER 82-0245] A82-22074

WING SLOTS
Experimental study of delta wing leading-edge devices for drag reduction at high lift --- conducted in Langley 7- by 10-foot high speed tunnel N82-17125

WINGLETS
Aerodynamic evaluation of winglets for transport aircraft [AIAA PAPER 81-1215] A82-22245

WINGS
Integration of a code for aeroelastic design of conventional and composite wings into ACSYNT, an aircraft synthesis program --- wing aeroelastic design (WADES) [NASA-CR-137805] N82-16069
Theory and experiment in unsteady aerodynamics [NLR-MP-80046-U] N82-17128
Experimental verification of an aerodynamic parameter optimization program for wind tunnel testing [AD-A107727] N82-17134

WORKLOADS (PSYCHOPHYSIOLOGY)
Flight simulation consoles, aid or obstruction - Objective evaluation of control consoles of modern flight and tactics simulators [DGLR PAPER 81-097] A82-19269

X

XV-11A AIRCRAFT
A study of the suitability of the all fiberglass XV-11A aircraft for fuel efficient general aviation flight research A82-20764

XV-15 AIRCRAFT
Flexibility is offered by XV-15 tilt-rotor concept A82-19300

Y

YAW
A velocity vector measuring system with 13 asymmetric wedge type yawmeters --- measuring flow distribution around the empennage of STOL models [NAL-TR-674] N82-17477

MIHALOEW, J. R.
A real time Pegasus propulsion system model for VSTOL piloted simulation evaluation
[AIAA PAPER 81-2663] A82-19221
MILLARD, S. E.
Radiometric measurements at 80 GHz
A82-18943
MILLER, G. K., JR.
An analytical technique for the analysis of airplane spin entry and recovery
[AIAA PAPER 82-0243] A82-19786
MILLER, V. R.
Prediction of aircraft interior noise using the statistical energy analysis method
[ASME PAPER 81-DET-102] A82-19332
MINECK, D. W.
Digital avionics - Advances in maintenance designs
[AIAA 81-2240] A82-20294
MINTER, E. A.
Large-scale wind tunnel tests of a sting-supported V/STOL fighter model at high angles of attack
[AIAA PAPER 81-2621] A82-19208
MIRANDA, L. R.
A perspective of computational aerodynamics from the viewpoint of airplane design applications
[AIAA PAPER 82-0018] A82-22028
MITCHELL, R. G.
An airline view of the corrosion problem
N82-17352
MITCHELL, T. R.
FAA/NWS aviation route forecast /ARF/ development
[AIAA PAPER 82-0013] A82-22027
MOERDER, D. D.
Piloted simulation of an on-board trajectory optimization algorithm
A82-20296
MONK, P. W. C.
A surveillance airship for the New Zealand environment
A82-20558
MOREL, J. P.
A progress report on the European Transonic Wind Tunnel Project
[ONERA, TP NO. 1981-121] A82-19737
MORGAN, S.
An investigation of multi-axis isometric side-arm controllers in a variable stability helicopter
[AD-A106759] N82-17226
MORLEY, B. M.
Airborne lidar measurements of smoke plume distribution, vertical transmission, and particle size
A82-21386
MORRIS, A. W.
Corrosion control test method for avionic components
[AD-A108061] N82-17171
MOSES, C. A.
The sooting tendency of fuels containing polycyclic aromatics in a research combustor
[AIAA PAPER 82-0299] A82-19791
MOSES, K.
SIFT: An ultra-reliable avionic computing system
N82-17115
MOUL, T. M.
Spin tests of a single-engine, high-wing light airplane
[NASA-TP-1927] N82-16068
MOWFORTH, E.
An introduction to the airship
A82-20552
MOXEY, C.
Integrated control of mechanical system for future combat aircraft
N82-17117
MUEHLBAUER, J. C.
Turboprop cargo aircraft systems study
[NASA-CR-165813] N82-16070
MUELLER, M.
Rotor model for the verification of computational methods
[ISD-275] N82-17638
MUELLER, T. J.
Experimental studies of the Eppler 61 airfoil at low Reynolds numbers
[AIAA PAPER 82-0345] A82-19796
MULLEN, J., JR.
Integration of a code for aeroelastic design of conventional and composite wings into ACSYNT, an aircraft synthesis program
[NASA-CR-137805] N82-16069
MUNK, R.
Skyship 500 - The development of a modern production airship
A82-20559
MURTHY, H. S.
Subsonic and transonic roll damping measurements on Basic Finner
A82-19958
MUSZYNSKA, A.
A parametric study of dynamic response of a discrete model of turbomachinery bladed disk
[ASME PAPER 81-DET-137] A82-19349

N

NAEGELI, D. W.
The sooting tendency of fuels containing polycyclic aromatics in a research combustor
[AIAA PAPER 82-0299] A82-19791
NAGY, F., JR.
ATCRBS uplink environment measurement near Jacksonville, Florida
[AD-A108053] N82-16063
NAKAI, E.
Some experimental investigations on transonic flutter characteristics of thin plate wing models with sweptback and tapered tips
[NAL-TR-682] N82-16050
NAKAYA, T.
A velocity vector measuring system with 13 asymmetric wedge type yawmeters
[NAL-TR-674] N82-17477
NARENDRAN, G.
Pade approximation applied to flow past thin airfoils
A82-20728
NASTASE, A.
Use of high conical flow theory for the determination of the pressure distribution on the wave rider and its agreement with experimental results for supersonic flow
A82-19197
NATSUME, A.
Flow field around an oscillating airfoil
A82-20813
NAVARRO, R. H.
Development of a computer based presentation of non-steady helicopter rotor flows
[AD-A108107] N82-17131
NELMS, W. P.
Airframe effects on top-mounted inlet systems for VSTOL fighter aircraft
[AIAA PAPER 81-2631] A82-19212
Concept definition and aerodynamic technology studies for single-engine V/STOL fighter/attack aircraft
[AIAA PAPER 81-2647] A82-19216
NELSON, D. P.
Isolated nacelle performance - Measurement and simulation
[AIAA PAPER 82-0134] A82-22054
NEWMAN, J. C., JR.
A crack-closure model for predicting fatigue crack growth under aircraft spectrum loading
A82-20509
NEWMAN, L. C.
Requirements for instrument approaches to converging runways
[AD-A108075] N82-17144
Survey of 101 US airports for new multiple instrument approach concepts
[AD-A107812] N82-17229
NGUYEN, L. T.
High angle-of-attack characteristics of three-surface fighter aircraft
[AIAA PAPER 82-0245] A82-22074
NICOLAI, C.
Octave bandwidth dual polarized antenna
A82-18934
NIEDERMAYER, E. J.
Airworthiness of airships
A82-20557

NIELSEN, N. B.
Airborne lidar measurements of smoke plume distribution, vertical transmission, and particle size
A82-21386

NIGHTINGALE, S. J.
A study of potentially low cost millimetre-wave radiometric sensors
A82-18942

NIKIFORUK, P. N.
Analytical control law for desirable aircraft lateral handling qualities
A82-21941

NIVERT, L. J.
Studies of modern technology airships for maritime patrol applications
A82-20554

NIXON, J.
Instrumentation remote 'mini' ground station
A82-20770

NOGUCHI, M.
A velocity vector measuring system with 13 asymmetric wedge type yawmeters
[NAL-TR-674] N82-17477

NORED, D. L.
Advanced subsonic transport propulsion
[AIAA PAPER 81-0811] A82-20874

NORVIEL, V.
Numerical and flight simulator test of the flight deterioration concept
[NASA-CR-3500] N82-16655

NOWAK, M.
A simplified wing procedure in connection with the lifting line theory and the doublet-lattice method
A82-19195

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A82-10000 Series)

All publications abstracted in this Section are available from the Technical Information Service. American Institute of Aeronautics and Astronautics, Inc. (AIAA), as follows: Paper copies of accessions are available at $8.00 per document. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand, and at the rate of $1.35 per microfiche for standing orders for all *IAA* microfiche.

Minimum air-mail postage to foreign countries is $2.50 and all foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to AIAA Technical Information Service. Please refer to the accession number when requesting publications.

STAR ENTRIES (N82-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $4.00 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA. A listing of public collections of NASA documents is included on the inside back cover.

Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 3-13.

Attention is given to the improvement and optimization of overall transparency configurations in military aircraft. A number of areas for development effort are identified. These include (1) the achievement of undistorted views from helicopter transparencies, (2) the need for distortionless, near-360-deg vision from fixed wing strike aircraft windscreens and canopies, (3) the reduction of transparency-induced cockpit noise, (4) the lowering of glint phenomena through transparency surface reflectivity reduction, (5) the design of alternative windscreen washers and wipers, (6) the reduction of strike aircraft combat losses due to pilot injury, by means of transparent armor, (7) emergency repair schemes under battle conditions, and (8) nuclear effects due to overpressure, flash and thermal effects, and radiation levels. O.C.

A82-24303 **Deficiencies and constraints that affect the design of cockpit enclosures and transparencies.** J. H. Lawrence, Jr. (Douglas Aircraft Co., Long Beach, CA). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 15-24.

Maximum-visibility cockpit enclosure and transparency design problems are considered in light of experience with the development of the DC-10, in which these design considerations were addressed by means of a systems approach. The strongest constraint is shown to be the aerodynamic shaping of the aircraft, which, because of the slopes and shapes required, may be unacceptable to the pilot on the grounds of distortion and can increase the difficulty of designing such subsystems as the electrical, anti-icing, and rain removal. Attention is also given the inadequacies of glass-acrylic laminates under cyclic loading, thermal cycling and contact with moisture, the seals and mounting of the transparencies in their support structures, and up/down-left/right charts for both minimum recommended vision and the captain's binocular vision envelope. O.C.

A82-24304 **Fuel-efficient windshields for transport, commuter and business aircraft.** G. L. Wiser (Sierracin Corp., Sylmar, CA). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 25-95. 34 refs.

The effects of weight and drag reduction measures involving windshields and their associated structures and systems on fuel efficiency are explored. It is shown that the incorporation of these techniques can save up to 80,000 gallons of fuel/year per aircraft in wide-body commercial aircraft applications, and 12,000 gallons/year per aircraft in the case of commuter designs. The alternatives considered include (1) flat glass windshields, (2) curved glass windshields, (3) curved high-strength glass windshields, (4) structurally-integrated curved windshields, (5) curved stretched acrylic windshields, (6) curved, chemically-strengthened glass windshields, and such associated systems as temperature controllers and rain removal. O.C.

A82-24305 **Transparencies - What an aircraft designer should know.** P. J. Sharp (Lucas Aerospace, Ltd., Luton, Beds., England). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 97-111.

The effect of windscreen lay-back angle on aircraft weight, energy requirements and optical characteristics are quantified for a typical, small jet aircraft, and the problems associated with the electrical deicing of irregular areas are examined. Weight effects are due to the load-transfer requirements of pressurized cabin transparencies. Additional factors considered are bird strikes, windscreen visual distortion, heating element positioning, and certification criteria. O.C.

A82-24306 **Transparency design decisions - Assessing their impact on visual performance.** R. G. Eggleston and L. V. Genco (USAF, Aerospace Medical Research Laboratories, Wright-Patterson AFB, OH). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 113-128.

The efficiency of aircraft transparency designs is considered as an information system in which the scene, transparency and pilot are separate elements. A transparency may alter the scene visible to a pilot in four ways: refraction, reflection, absorption and transmission. These are the bases for such common transparency optical degradation problems as (1) distortion, (2) multiple imaging, (3) rainbowing, (4) volume and surface haze, (5) internal reflections, and (6) transmission loss. The contribution to each of these defects by transparency slant, flatness, single or compound curvature, material, thickness, absorption characteristics, scratch resistance, UV resistance, and monolithic or laminated construction, are correlated in tabular form along with observer and scene factors that may contribute to the quality or degradation of performance. O.C.

A82-24307 **Aircraft transparency design guide.** L. Moosman (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) and J. H. Lawrence, Jr. (Douglas Aircraft Co., Long Beach, CA). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 129-139.

The 'Guidelines for the Design of Aircraft Windshield/Canopy Systems' is a design manual which serves as a single source for all requirements, data and systems recommendations relevant to the development of aircraft transparencies. The guide covers: (1) management of transparencies and related subsystems design; (2) the transparency/aircraft configuration relationship, (3) vision and optical design; (4) structural design and analysis; (5) bird impacts; (6) materials; (7) environmental design; (8) combat exposure design; (9) maintainability; (10) reliability; and (11) transparency design verification and quality assurance requirements. The data from which this compilation of requirements was derived include FAR 25, SAE AS580, and the Air Force Systems Command Design Handbook. O.C.

A82-24308 **A new angular deviation measurement device for aircraft transparencies.** H. L. Task, R. G. Eggleston, and L. V. Genco (USAF, Human Engineering Div., Wright-Patterson AFB, OH). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 141-147.

An optoelectronic angular deviation measurement device incorporating a CCD array, which offers accuracy, repeatability and ease of operation while occupying a much smaller volume than long-throw laser devices of comparable performance, is described. The instrument's resolution is 0.07 mrad, and F-16 windscreen measurements have been found to compare favorably with data produced by alternative techniques. The device is to be used in characterizing distortion levels in such transparency-incorporating systems as head-up displays. O.C.

A82-24309 **Portable transparency optical test system /P-TOTS/.** L. V. Genco, R. G. Eggleston, and H. L. Task (USAF, Aerospace Medical Research Laboratories, Wright-Patterson AFB, OH). In: Conference on Aerospace Transparencies, London, England), September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 149-160.

The Portable Transparency Optical Test System (P-TOTS) described is a novel device for the collection of visual and optical data from installed transparencies, including the evaluation of time-dependent changes in optical quality. Although P-TOTS has to date been employed in the birefringence, distortion, binocular distortion, multiple image and haze characterization of F-111 windscreens, the device may be adapted to other aircraft through a mounting-fixture change estimated to cost $4000. O.C.

A82-24310 **Abrasion resistant coated plastic products for aircraft.** W. F. Fischer and W. C. Harbison (Swedlow, Inc., Garden Grove, CA). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 185-204. 10 refs.

Experimental results concerning the use of the application of abrasion-resistant coatings to polycarbonate and acrylic transparencies in architectural and ground-transportation installations are correlated to the use of such coatings on aircraft transparencies. A failure theory is substantiated through a combination of the experimental data with separate results of accelerated testing. A silica-filled polysiloxane coating is shown to offer the greatest resistance to abrasion. The failure mode of the coatings is generally mechanical degradation, consisting of cracking or microcracking from repeated tensile elongation/compression associated with thermal, moisture gain/loss and flexural cycling. O.C.

A82-24311 **Proposed method for abrasion testing transparent plastics and coatings.** A. J. Bunje (Texstar Corp., Texstar Plastics, Grand Prairie, TX). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 205-213.

An examination is presented of methods for the abrasion testing of transparent plastics and coatings, with attention to the preparation and interpretation of the Taber Abraser and Falling Sand tests. A test methodology is described which allows the testing of all materials and coatings irrespective of hardness, and in which the entire sample surface is exposed to the abrading action. The larger area thereby measured yields more representative results, which are shown to be highly reproducible. Test results data are presented in tabular form. O.C.

A82-24312 **Windshield system structural enhancement.** R. J. Speelman, R. H. Walker, and R. L. Peterson (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 217-243. 22 refs.

Transparency technology investigations with emphases on improved birdstrike resistance and longer service life are being conducted by the Air Force Flight Dynamics Laboratory. In addition to supporting such existing systems as the T-38, F-16 and F-111, a technical base is emerging for the development of new transparencies which includes: (1) computer-aided design procedures for birdstrike structural analysis; (2) birdstrike hazard risk prediction techniques; (3) design procedures for the integration of birdstrike protection and large field-of-view capabilities with high-temperature operation; (4) design procedures for consideration of ballistic fragment impact resistance; (5) testing procedures for improved correlation between laboratory and field performance; and (6) a transparency system design-guideline manual. O.C.

A82-24313 # **An analytical methodology to predict potential aircraft losses due to canopy birdstrikes.** J. C. Halpin, J. M. Griffin, and K. T. Jackson, Jr. (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 245-271.

An analysis for the projection of birdstrike damage is presented in which data for the F-4 aircraft is used as a basis for the development of a model and the F-16 is used for verification. After determining the operational impact rate (OIR), a kinetic energy matrix is calculated and a line representing the expected canopy capability is drawn through this matrix. The canopy capability line from the kinetic energy matrix is then superposed on the birdstrike matrix, and the birdstrike number is derived by summing the appropriate values from the matrix. If the failure mode is deflection rather than penetration, critical areas corresponding to certain kinetic energy levels must be determined and then used to recalculate the expected birdstrike matrix. O.C.

A82-24314 **The role of finite element analysis in the design of birdstrike resistant transparencies.** B. S. West (Dayton, University, Dayton, OH). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 273-295. 8 refs. Contracts No. F33615-75-C-3134; No. F33615-76-C-3103; No. F33615-80-C-3401.

The Materially and Geometrically Nonlinear dynamics Analysis problems (MAGNA) finite element code, for the efficient analysis of crew enclosure structures during bird impact, is described. The design variables typically incorporated into parametric design data in the code are: (1) transparency stiffness, which depends on material, configuration and thickness; (2) support structure stiffness; (3) load location; (4) load magnitude; and (5) edge member configuration. Transparency edge member integrity has proved to be critical to the birdstrike resistance of aircraft transparency/support systems. Computer run time increases by more than an order of magnitude if the parametric study is conducted using all available nonlinear options rather than linear elastic analysis. Several sample analyses are presented to demonstrate the linear and nonlinear solution capabilities of the MAGNA program. O.C.

A82-24315 **Aircraft transparency bird impact analysis using the MAGNA computer program.** R. E. McCarty (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 297-313. 14 refs.

The MAGNA computer program is shown to realistically simulate the nonlinear dynamic structural response of aircraft transparencies to birdstrike loading. It is not yet possible, however, to accurately predetermine the loads resulting from bird impact on very flexible transparencies, due to the fact that the magnitude of the loads and the surface area and time period over which they act strongly depend on the dynamic response of the transparency. MAGNA is especially applicable to relatively stiff transparencies, in which the effects of load-response coupling may be ignored, and may prove useful in the analysis of any problem involving the response of a structure subject to static or transient loads. O.C.

A82-24316 **The effects of bird orientation on load profile and damage level.** A. Challita and B. S. West (Dayton, University, Dayton, OH). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 315-338. 7 refs. Contract No. F33615-78-C-3402.

A number of programs have been initiated with the aim to increase the birdstrike resistance of aircraft and their components. A description is presented of specific programs with two basic objectives. One objective is related to a characterization of the loads generated during birdstrike to use as input to the modern finite element structural analysis codes which are currently used as a transparency design tool. The second objective involves the evaluation of the testing procedures employed to evaluate the level of birdstrike protection afforded by a given flight hardware system. Of three orientations tested, end-on orientation was found to be as critical, or more critical, than the other orientations. Side-on orientation was the least critical orientation. During end-on birdstrike testing, pitch and yaw would tend to decrease critically. G.R.

A82-24317 **Acrylic - A timely review.** K. G. Granger (Swedlow, Inc., Garden Grove, CA). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980, Proceedings. London, Society of British Aerospace Companies, Ltd., 1981, p. 341-354, 356, 357.

The review is concerned with the use of acrylics in applications related to aircraft transparencies, taking into account the principal aircraft grades of acrylic. Main qualities of acrylics with respect to the considered applications include its ability to maintain excellent strength, transparency, and clarity in environments which comparatively quickly cause deterioration in other transparent plastics. For aircraft glazings applications, only glass is superior to acrylic in terms of weatherability, solvent resistance, and surface hardness. However, glass is inferior to plastics in connection with greater weight, failure mode, and relative difficulties with respect to the formation of aerodynamic shapes. A number of case histories are discussed which demonstrate the advantages of a use of acrylic. Attention is also given to the proposed laminated F-16 canopy design and the development of modified acrylics. G.R.

A82-24318 **Lucas stretched acrylic.** D. B. Bell (Lucas Aerospace, Ltd., Luton, Beds., England). In: Conference on Aerospace Transparencies, London, England, September 8-10, 1980,

A82-24715 **Fatigue test of the typical main rotor controls component.** J. Slack and J. Cernosek (Bell Helicopter Textron, Fort Worth, TX). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 17 p.

The general procedure used to qualify a fatigue critical component is illustrated with the aid of a flow chart. The decision regarding the condition of fatigue tests for a particular component is made as soon as practical in a program. The decision takes into consideration the expected fatigue environment on the helicopter. An early diagnosis of potential component fatigue problems is important to prevent certification delays, and costly manufacturing charge requirements. Considerations of the plan of test are discussed, giving attention to the test specimen, the type of test, the test loads, and the test machine. The more important aspects concerning the implementation of the test plan are related to the test set up, the failure analysis, and the feedback requirements. G.R.

A82-24716 **Hypothetical fatigue life problem - Application of Aérospatiale method.** G. Stievenard (Société Nationale Industrielle Aérospatiale, Division Hélicoptères, Marignane, Bouches-du-Rhône, France). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 34 p.

The mean fatigue curve calculation is considered, taking into account the permissible alternating load and the plotting of the unit Wöhler curve. The Wöhler curve makes it possible to calculate, from test results, a mean fatigue curve and a standard deviation representative of the scatter. Attention is given to safe fatigue curve calculation, aspects of flight load determination, the fatigue life calculation using peak value flight loads, a fatigue life calculation using cycle-counted flight loads, and the values for a G.A.G. cycle. It is pointed out that the Wöhler curves for steels loaded without fretting are generally flat and that this results in very high difference in the number of cycles for low variations of loading. G.R.

A82-24717 **The cargo helicopter - A logistical vehicle.** R. L. Stoessner and R. C. Heehn (U.S. Army, Training and Doctrine Command, Fort Monroe, VA). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 13 p. 9 refs.

The availability of adequate supplies is a crucial factor for an army engaged in a battle. In the case of highly mobile forces involved in other than light assault missions, supply requirements combined with the factor of time sensitivity dictate the use of air logistics helicopters. The logistical helicopters are considered an integral part of the support command's transportation service. Attention is given to the employment of air transport units providing combat service support from a logistical base to a combat force such as a division or brigade which is operating in an underdeveloped area. The Tactical Mobility Requirements Board report of 1962, laid the foundation for true airmobility of Army Forces. The versatility of the cargo helicopter was demonstrated in Vietnam. However, much of the operational experience gained is not applicable to a mid- or high-intensity combat environment. The air defense threat envelope will require the cargo helicopter to utilize terrain masking to the maximum. G.R.

A82-24718 **Boeing Vertol fatigue life methodology.** G. H. Thompson (Boeing Vertol Co., Philadelphia, PA). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 8 p. 7 refs.

It is pointed out that, with respect to basic philosophy, the fatigue life methodology of the considered American helicopter manufacturer has changed little over the years. Major changes have been only in the mechanics of calculation. High-speed computers are performing the work which once had to be done manually. The life calculation procedure is started by developing the mission profile. This consists of a fatigue loading schedule and flight profile splits. To determine the endurance limit of a helicopter dynamic component, full-scale bench fatigue tests are conducted. The use of the fatigue life methodology is illustrated with the aid of an example involving the solution of a hypothetical fatigue life problem. Attention is given to life calculation without cycle counting, life calculation with cycle counting, and the ground-air-ground condition. G.R.

A82-24719 **Helicopter rotor load prediction.** J. G. Yen (Bell Helicopter Textron, Fort Worth, TX). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 10 p. 12 refs.

In the preliminary design of rotor components, the fatigue design loads must be estimated. The methods which have been used for estimating the design loads at Bell Helicopter Textron (BHT) are discussed in this paper. A review of rotor loads prediction methods starting with the empirical method used in the earlier years of helicopter design through the application of the sophisticated computer analysis of today is presented. Examples of correlation of blade and pitch-link loads between flight test and analytical prediction for a two-bladed teetering rotor and a four-bladed hingeless rotor in level flight are shown. Results indicate that the accuracy of analytical prediction depends upon an accurate representation of the rotor structure and the use of state-of-the-art aerodynamics and, to a great extent, the user's knowledge and experience with the analysis. Applications of C81 to predicting loads following blade damage are also discussed briefly. (Author)

A82-24720 **Advanced attack helicopter fatigue testing - Overview.** G. D. Deveaux (Hughes Helicopters, Inc., Test Laboratories, Culver City, CA). *American Helicopter Society, Specialists Meeting on Helicopter Fatigue Methodology, St. Louis, MO, Mar. 25-27, 1980, Paper.* 13 p.

A description is presented of tests conducted to study the fatigue life of critical components of the YAH-64 helicopter. In accordance with the Airworthiness Qualification Specification six specimens are required to substantiate a fatigue life of 4500 hours. Constant load amplitude, S-N type testing is used for all component tests with the exception of the gun support structure, where spectrum loading type testing is specified. The components required to be fatigue tested belong to the main rotor group, the tail rotor group, the controls group, the drive system group, and the fuselage. The test loading system is discussed, taking into account the general approach, the actuators, and the air springs. Details regarding the data acquisition system are also provided. G.R.

A82-24803 **Novel metal-ceramics-composite sealing coatings in aircraft engines (Neuartige Metall-Keramik-Verbund-Dichtungsbeläge in Flugtriebwerken).** A. Sickinger and V. Wilms (Motoren- und Turbinen-Union München GmbH, Munich, West Germany). In: Composite materials; Lecture and Discussion Meeting, Constance, West Germany, April 17, 18, 1980, Reports. Oberursel, West Germany, Deutsche Gesellschaft für Metallkunde, 1981, p. 133-140. In German.

Requirements for the enhancement of the performance of aircraft engines and the reduction of fuel consumption make it necessary to operate aircraft engines at higher gas pressures and temperatures. The development of novel metal-ceramics-composite sealing coatings makes it possible to overcome certain problems related to more exacting sealing requirements and greater thermal extension in connection with the new operational conditions. The sealing coating provides a means to compensate for different thermal extensions and manufacturing tolerances existing for rotating and stationary structural components. It is feasible to obtain minimum clearance values and to reduce attrition effects for the rotating component. Other important benefits of the coating are related to its thermal-barrier characteristics. Attention is given to the requirements which the coating has to satisfy, its application by thermal spraying, the coating composition, and some test results. G.R.

A82-24805 **Carbon-fiber composites - A fiber composite material for highly stressed light-construction components (CFK - Ein Faserverbundwerkstoff für hochbelastete Leichtbauteile).** G. Stöffler, W. Scheer, and H. Wurtinger (M.A.N. - Neue Technologie, Munich, West Germany). In: Composite materials; Lecture and Discussion Meeting, Constance, West Germany, April 17, 18, 1980, Reports. Oberursel, West Germany, Deutsche Gesellschaft für Metallkunde, 1981, p. 235-250. 7 refs. In German.

The properties of the basic materials used in fiber-reinforced nonmetallic materials are considered, and the calculation of the strength characteristics of the composite material is discussed, taking into account stresses and fiber orientation in the case of the wing of an aircraft. Attention is given to the elasticity characteristics of a unidirectional layer, a fracture criterion for the unidirectional layer, a computational flow diagram for the calculation of the loading capacity of the composite, the fracture characteristics and the mechanical characteristics of carbon-fiber composites (CFC), and the thermal properties of CFC. A description is presented of examples which illustrate various possibilities for an employment of CFC. G.R.

A82-24814 # **Efficient combinations of numerical techniques applied to aircraft turning performance optimization.** D. Blank and J. Shinar (Technion - Israel Institute of Technology, Haifa, Israel). *Journal of Guidance, Control, and Dynamics,* vol. 5, Mar.-Apr. 1982, p. 124-130. 23 refs.

This paper presents efficient combinations of numerical optimization techniques summarizing their relative merits. Four basic methods handling constraints without penalty functions, are considered: (1) sequential gradient-restoration, (2) quasilinearization, (3) neighboring extremals, and (4) direct shooting. The first two are modifications of algorithms introduced by Miele, avoiding numerical differentiation and eliminating the anchoring effect of the original formulation. The third one is a generalization of an algorithm due to Bryson and Ho. The individual and combined methods are tested by solving the optimization of vertical and three-dimensional turning maneuvers as examples. Results show that an appropriate combination of algorithms reduces the computational effort by more than 50%. (Author)

A82-24825 **Recent developments in materials and processes for aircraft corrosion control.** S. J. Ketcham and J. J. De Luccia (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA). *SAMPE Quarterly,* vol. 13, Jan. 1982, p. 32-37. 10 refs.

This paper describes advances in materials and processes for aircraft corrosion control currently in use and those under development in the laboratory for future use. Areas covered are corrosion preventive compounds, organic and inorganic coatings, alloy selection and heat treatments. Available materials highlighted are water displacing compounds, sealant primers, aluminum alloys 7050 and 7010 including a state-of-the-art report on the use of exfoliation and stress corrosion resistant tempers. Materials under development that offer promise of contributing to future advances include water displacing paints, flexible primer, crack arrestment compounds, powder metallurgy, aluminum alloys and substitutes for cadmium plating. (Author)

A82-24892 † **A method for the investigation of gyrostabilization systems (Ob odnom metode issledovaniia sistem giroskopicheskoi stabilizatsii).** L. K. Kuz'mina. In: The direct method in stability theory and its applications. Novosibirsk, Izdatel'stvo Nauka, 1981, p. 195-200. 9 refs. In Russian.

The paper examines gyrostabilization systems whose differential equations of motion include a large parameter. The conditions under which a simplified low-order mathematical model can be used to study such systems are investigated. Results are presented for the example of a single-axis gyrostabilizer. B.J.

A82-24970 **Angle of downwash behind a wing in unsteady flow (Srazovy uhel za neustalene obtekanym kridlem).** M. Zadnik. *Zpravodaj VZLU,* no. 4, 1981, p. 167-171. 5 refs. In Czech.

The paper presents a method for determining the angle of downwash behind a wing in the plane of symmetry of the aircraft when the circulation about the wing varies periodically with time. The solution is obtained for an inviscid medium on the assumption of the total rollup of the free and starting vortices. The results are presented in the form of a nomogram. B.J.

A82-24972 **The reliability and safety of small passenger aircraft (Problematika spolehlivosti a bezpecnosti maleho dopravniho letounu).** O. Gregr and V. Kahanek. *Zpravodaj VZLU,* no. 4, 1981, p. 189-195. 5 refs. In Czech.

Problems associated with the reliability and safety assurance of small passenger aircraft during certification are discussed. The philosophy of flight safety assessment according to NLGS-2 requirements is described, and the quantitative limits of the probability of an accident due to damage are determined. Methods of aircraft reliability analysis and testing are briefly described. B.J.

A82-24973 **Spoilers or auxiliary flaps (Spoilery nebo pomocna kridelka).** V. Pokorny. *Zpravodaj VZLU,* no. 5, 1981, p. 213-217. In Czech.

The possibilities and advantages of using auxiliary flaps (that part of ailerons or extended flaps controlled by a servo actuator) instead of spoilers for the improvement of lateral control are discussed. It is shown that the auxiliary flaps have definite advantages over spoilers and allow a wider range of application. B.J.

A82-24974 **Oscillations and vibrations of aircraft on runways (Kmitani a vibrace letadel pri pozemnich operacich).** O. Kropac, J. Sprinc, and M. Prochazka. *Zpravodaj VZLU,* no. 5, 1981, p. 219-234. 8 refs. In Czech.

Analytic and experimental studies on the vibration of aircraft on runways are summarized. The aircraft and the runway are considered as interacting components of a dynamic system. This is taken into account in developing a classification of runways according to surface irregularities and the corresponding dynamic response of the aircraft. Attention is given to the motion of the aircraft as a whole, to vibrations of its parts, and to certain special phenomena, particularly the inverse effect of damping. B.J.

A82-25002 **Analysis of the crossed dipole antenna as a model for aircraft in an electromagnetic environment.** R. W. Burton (Colorado, University, Colorado Springs, CO) and R. W. P. King (Harvard University, Cambridge, MA). In: International Symposium on Electromagnetic Waves, Munich, West Germany, August 26-29, 1980, Proceedings. Munich, International U.R.S.I.-Symposium, 1981, p. 311 A/1-311 A/4. 14 refs.

The currents and charges induced on the metallic skin of a crossed dipole antenna immersed in an electromagnetic plane wave field are analyzed experimentally and theoretically for both electrically thin and electrically thick arm diameters over a wide range of arm lengths highlighting critical boundary conditions. An analysis is also carried out of electrically thick cylinders with flat plate cross arms. The boundary conditions at the junction of the crossed dipole with electrically thin arms are developed and correlated with experimental results over a range of arm lengths that clearly define the boundary conditions on charge and current in the junction area. The results are interpreted in terms of the forced and resonant currents directly evolved from an understanding of the electrically thin receiving unit. C.R.

A82-25011 **Calculation and measurement of electric field strength for airborne antennas in the LF/MF range.** R. J. Luebbers and J. Bash (Ohio University, Athens, OH). In: International Symposium on Electromagnetic Waves, Munich, West Germany, August 26-29, 1980, Proceedings. Munich, International U.R.S.I.-Symposium, 1981, p. 334 A/1-334 A/4. 5 refs.

A technique has been developed to calibrate in absolute field strength the loop antenna and associated receiving system for the Automatic Direction Finding equipment for three different aircraft. The calibrated receiving systems are flown at a variety of altitudes over various types of terrains, and field strengths for signals in the desired frequency range are measured. A comparison is made between calculated and measured results, showing good agreement to within a few dB, and confirming the accuracy of both the calibration method and the propagation model. D.L.G.

A82-25050 # **AFWAL turbine engine controls research and development - Present and future.** L. L. Small (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH). *American Institute of Aeronautics and Astronautics, Aerospace Sciences Meeting, 20th, Orlando, FL, Jan. 11-14, 1982, Paper 82-0321.* 7 p. 9 refs.

It is noted that, within the next few years, digital computer-based engine controls will see operational use in both military and commercial applications. Current and planned activities at the Air Force Wright Aeronautical Laboratories in the areas of multivariable control logic, control system integration, and reliability/flight safety are reviewed. C.R.

A82-25113 # **Rapid extraction of layer relative humidity, geopotential thickness, and atmospheric stability from satellite sounding radiometer data.** W. L. Smith (NOAA, National Earth

Satellite Service, Madison, WI) and F. X. Zhou. *Applied Optics,* vol. 21, Mar. 1, 1982, p. 924-928. 5 refs.

Algorithms are presented which allow fast retrieval of major meteorological parameters from individual radiance measurements, thereby avoiding the time consuming radiative transfer equation inversion process as required for detailed vertical profile determinations. The relative humidity and geopotential thickness patterns from satellite data are shown to be consistent with radiosonde data. The atmospheric stability index, total-totals, calculated from satellite derived relative humidities and geopotential thicknesses is in good agreement with subsequent convective weather. Computer programs based on the proposed algorithms produce contour displays of the humidity, geopotential thickness, and total-totals within 10 min of the ingestion of the satellite data. V.L.

A82-25119 **Aircraft/airport compatibility - A constant challenge for aircraft designers.** W. E. Parsons and M. E. Wilfert (Douglas Aircraft Co., Long Beach, CA). *Exxon Air World,* vol. 34, no. 1, 1982, p. 18-21, 30.

The consideration given during airport planning and aircraft design to the compatibility of the two systems is described, with attention to the impact of design alternatives on direct, indirect and total operating costs through the reduction of ground time for storage and maintenance. Major aspects of existing and planned airport facilities considered during aircraft design include runway length and width, taxiway width, pavement fillets, and pavement strength, along with the location and accessibility of the various servicing points of the aircraft. Emphasis is placed on the avoidance of sequencing in servicing operations, so that lavatory, water, electrical, pneumatic and air conditioning systems may be readied for flight simultaneously. O.C.

A82-25154 * # **The design of a wind tunnel VSTOL fighter model incorporating turbine powered engine simulators.** R. O. Bailey (NASA, Ames Research Center, Moffett Field, CA), M. R. Maraz, and P. E. Hiley (Douglas Aircraft Co., St. Louis, MO). *American Institute of Aeronautics and Astronautics and NASA Ames Research Center, V/STOL Conference, Palo Alto, CA, Dec. 7-9, 1981, AIAA Paper 81-2635.* 27 p. 8 refs. Contract No. F33615-77-C-2097.

A wind-tunnel model of a supersonic VSTOL fighter aircraft configuration has been developed for use in the evaluation of airframe-propulsion system aerodynamic interactions. The model may be employed with conventional test techniques, where configuration aerodynamics are measured in a flow-through mode and incremental nozzle-airframe interactions are measured in a jet-effects mode, and with the Compact Multimission Aircraft Propulsion Simulator which is capable of the simultaneous simulation of inlet and exhaust nozzle flow fields so as to allow the evaluation of the extent of inlet and nozzle flow field coupling. The basic configuration of the twin-engine model has a geometrically close-coupled canard and wing, and a moderately short nacelle with nonaxisymmetric vectorable exhaust nozzles near the wing trailing edge, and may be converted to a canardless configuration with an extremely short nacelle. Testing is planned to begin in the summer of 1982. A.L.W.

A82-25213 **Conflicts between random flights in a given area.** S. Ratcliffe and R. L. Ford (Royal Signals and Radar Establishment, Malvern, Worcs., England). *Journal of Navigation,* vol. 35, Jan. 1982, p. 47-71; Discussion, p. 72-74. 18 refs.

The present investigation is concerned with the segregation of air traffic in space and a division of the available sky in various sections to minimize conflicts between the various users. Random air traffic in a bounded volume of airspace outside the controlled airspace is considered. It is assumed that aircraft are all in straight line flight. The constraints make it possible to construct a model whose behavior can be defined quantitatively as an algebraic function of the small number of input parameters. Attention is given to a computer model, two-dimensional traffic, the constraints on the use of airspace, conflicts in three-dimensional airspace, the collision rate as a function of traffic mix, and alarm criteria for an advisory service. G.R.

A82-25216 * # **Advanced electronic displays and their potential in future transport aircraft.** J. J. Hatfield (NASA, Langley Research Center, Hampton, VA). *International Air Transport Association, Technical Symposium on Aviation Technology in the 80's, Montreal, Canada, Dec. 1-4, 1981, Paper.* 26 p. 29 refs.

It is pointed out that electronic displays represent one of the keys to continued integration and improvement of the effectiveness of avionic systems in future transport aircraft. An employment of modern electronic display media and generation has become vital in connection with the increases in modes and functions of modern aircraft. Requirements for electronic systems of future transports are examined, and a description is provided of the tools which are available for cockpit integration, taking into account trends in information processing and presentation, trends in integrated display devices, and trends concerning input/output devices. Developments related to display media, display generation, and I/O devices are considered, giving attention to a comparison of CRT and flat-panel display technology, advanced HUD technology and multifunction controls. Integrated display formats are discussed along with integrated systems and cockpit configurations. G.R.

A82-25323 # **Secondary radar problems - The presence of false echoes (Problemas del radar secundario - Presencia de ecos falsos).** M. G. Duran (Paracuellos del Jarama, Centro de Control de Navegación Aérea, Paracuellos del Jarama, Spain). *IAA/Ingeniería Aeronáutica y Astronáutica,* vol. 34, Jan. 1982, p. 5-10. In Spanish.

Techniques are described for the suppression of false radar echoes due to: (1) lateral lobe radar responses; (2) radar responses out of synchrony with the signals of the radar system; (3) responses corresponding to signals from previous radar repetition periods; (4) responses produced by a split in the number of echoes from a target aircraft; and (5) responses due to reflections. The most frequently used technique for the correction of these false-echo effects is improved side lobe suppression (ISLS), which involves the emission of radar pulse signals from an omnidirectional antenna. Techniques complementing ISLS include the false return elimination device and transponder suppression transmitter. False echo suppression by data processor programming techniques is also described. O.C.

A82-25324 # **Electronic flight instrument systems /EFIS/, the instrumentation of the 1980s (La instrumentación de los 80 /E.F.I.S./).** J. B. Galente. *IAA/Ingeniería Aeronáutica y Astronáutica,* vol. 34, Jan. 1982, p. 18-23. In Spanish.

The development of high-luminosity, high-resolution color coded CRT systems for the display of symbolic and alphanumeric flight data in cabins of 767/757-type commercial aircraft is discussed. These electronic flight instrument systems (EFIS) depend for their effectiveness on the incorporation of two techniques: (1) the shadow mask tube, derived from the trinitron color CRTs in use in radar color display terminals; and (2) stroke writing, in which each CRT electron gun can prolong its excitation of a given screen area under the control of a microprocessor. Progress in the development and experimental validation of these instruments has been so rapid as to allow general aviation use to begin in 1982. The more extensive use of CRTs in an 'all glass cockpit', pending further development, is also considered. O.C.

A82-25325 # **The toll of ILS-preventable aviation accidents (Costo de los accidentes aéreos evitables con ILS).** E. L. Abella. *IAA/Ingeniería Aeronáutica y Astronáutica,* vol. 34, Jan. 1982, p. 31-34. In Spanish.

Based on the statistical analysis of Simpson (1975), observations are presented concerning the aviation accidents which occurred in the U.S. from January 1964 to December 1972, with emphasis on landings. An attempt is made to determine the portion of those landing approach accidents that could have been prevented through the use of IFR procedures of a high degree of precision. Results are presented for the cases of commercial aviation, commuter aviation, and general aviation, and comparisons are made with general aviation VFR accidents. All comparative data are presented in tabular form. Attention is given to the estimation of preventable property losses as well as loss of lives. J.C.

A82-25347 † **Problems of numerical simulation of unsteady three-dimensional viscous-gas flows in nozzles (O zadachakh chislennogo modelirovaniia nestatsionarnykh prostranstvennykh techenii viazkogo gaza v soplakh).** A. T. Fedorchenko. *Zhurnal Vychislitel'noi*

Matematiki i Matematicheskoi Fiziki, vol. 22, Jan.-Feb. 1982, p. 178-196. 26 refs. In Russian.

The paper examines certain general problems involving the use of the complete Navier-Stokes equations for the numerical simulation of unsteady three-dimensional viscous-gas flows in nozzles. Models of porous boundaries are examined, and their acoustic characteristics are investigated. Attention is given to aspects of the control of gasdynamic (especially acoustic) parameters in such flows. As an example, a numerical analysis is presented of axisymmetric unsteady flows of a viscous gas in a region containing a Laval nozzle. B.J.

A82-25353 † **Stability of a three-stage dynamic stand (Ob ustoichivosti trekhstepennogo dinamicheskogo stenda).** N. V. Osadchenko. *Akademiia Nauk SSSR, Izvestiia, Mekhanika Tverdogo Tela,* Jan.-Feb. 1982, p. 20-27. 10 refs. In Russian.

The small-parameter method is used to derive equations of partial motion components for a three-stage dynamic stand designed for simulating the angular motions of moving objects. The fast-motion stability of the system is analyzed using a previously proposed method whereby the stability problem for three-axis systems is reduced to that for single-axis systems. A matrix interpretation of this method is presented, and stability bounds are determined. V.L.

A82-25499 **Importance of a tactical cargo aircraft in emergency relief (Intérêt d'un avion cargo tactique dans les secours d'urgence).** J. P. Chabanne (Service de Santé pour l'Armée de l'Air, Ecole d'Application; Centre de Recherche de Médecine Aérospatiale, Paris, France) and G. Jacob (Commandement du Transport Aérien Militaire, Vélizy-Villacoublay, Yvelines, France). *Médecine Aéronautique et Spatiale, Médecine Subaquatique et Hyperbare,* vol. 20, no. 79, 1981, p. 210-214. 7 refs. In French.

The use of the C 160 Transall aircraft in emergency relief operations at the site of medical disasters is discussed. Capabilities of the C 160 allow it to be useful for a number of purposes: (1) the transport of medical personnel and equipment into the disaster region; (2) the medical evacuation of the seriously ill and injured; (3) the resupply of the stricken area with food, fuel and medical supplies; (4) the supplementation of communications damaged by the disaster. Despite limitations in range, velocity and capacity, experience in humanitarian relief operations in Peru, Jordan and Nicaragua has shown its capacity to land on uneven terrain and robustness to make the C 160 a valuable tool in disaster intervention. A.L.W.

A82-25510 **Selection of telecommunication equipment - A new approach to the equivalent cost concept (Choix d'investissements en matériels de télécommunications - Une nouvelle approche de la notion de coût équivalent).** M. Minoux (CNET, Paris; CNET, Issy-les-Moulineaux, Hauts-de-Seine, France) and A. Guerard (CNET, Issy-les-Moulineaux, Hauts-de-Seine, France). *Annales des Télécommunications,* vol. 36, Nov.-Dec. 1981, p. 602-612. 5 refs. In French.

In order to apply cost equivalence to the purchase of telecommunication equipment from components with equal functional features, but with different costs and length of payback, an extension of amortization calculations was performed. It is shown that the increase in demand is not necessarily exponential, that the law of variation of optimal cost equivalence can be read directly from the curve of net costs of the equipment under consideration, that actualized costs depend on the criteria of the actual payback period. Each year of functional addition to the operating system is included in the calculations, rather than the projected lifetime. The payback period then becomes the prime criteria for determining the economics of the equipment added incrementally to the capacity of the network. The economics of a linear growth of demand are determined, and then extended to any form of growth with a constant economy-of-scale coefficient. M.S.K.

A82-25538 **Where is cobalt irreplaceable (Wo ist Kobalt unersetzlich).** J. C. Agarwal (Charles River Associates, Inc., Boston, MA). *(International Conference on Cobalt-Metallurgy and Uses, Brussels, Belgium, Nov. 10-13, 1981, Paper.) Metall,* vol. 36, Mar. 1982, p. 292, 293. In German.

It is pointed out that cobalt, at least on a short-term basis, is nearly irreplaceable in connection with certain of its applications, taking into account, in particular, its use in catalysts and in heat-resistant superalloys. Cobalt-containing superalloys are employed in gas turbines and engines, in connection with efforts related to the search for oil reservoirs and their exploitation, and in medical implants. A number of aircraft engines utilize cobalt as alloy component. The irreplaceableness of cobalt on a short-term basis is partly related to the long time required to develop a new aircraft engine. Cobalt is also widely used in the manufacture of permanent magnets. A crucial asset of cobalt with respect to its employment in equipment used for offshore drilling operations is its resistance against hydrogen sulfide and effects of marine climate conditions. Attention is also given to aspects of cobalt production and market trends. G.R.

NEW DEVELOPMENTS IN COCKPIT-HUMAN INTERFACES
E. B. Davies and J. B. Peckham 15 Jun. 1981 16 p Presented at 12th ICAS Congr., Munich, Oct. 1980
(RAE-TM-FS-412; BR80500) Copyright. Avail: Issuing Activity

Touch sensing displays, helmet sights, and direct voice inputs (DVI) are discussed. Cathode ray tubes (CRT) are cheaper than keyboards for touch sensing, but lack tactile differentiation capabilities. For designation tasks, e.g., touching the required radar return, accuracy must be much higher than for keyboarding. Head movement filtering is a problem with helmet sights, since output is delayed if too much filtering is attempted, and accuracy suffers if vibration is ignored. Cuing by LED's is restricted by the number of leads the helmet can incorporate, and CRT's are too heavy. Factors affecting DVI performance include electronic noise on intercoms, microphone to mouth distance, voice changes caused by stress, and the number of commands pilots can remember. Author (ESA)

AN ON BOARD SUPERVISORY SYSTEM FOR APPLICATIONS IN SPACE MISSIONS [UM SISTEMA DE SUPERVISAO DE BORDO PARA APLICACOES EM MISSOES ESPACIAIS]
Jose Carlos Maldonado and Ricardo deAzevedo Mendes Jun. 1981 13 p refs In PORTUGUESE; ENGLISH abstract Presented at the 2nd Natl. Automation Meeting, Salvador, Bahia, Brazil, Jul. 1981
(INPE-2097-RPE/327) Avail: NTIS HC A02/MF A01

The system, developed in the digital and analog system group/program, enables full duplex communication between an onboard and a ground microcomputer, based on a reserved protocol. The system performs the following functions: data acquisition, control, transmission and reception between an onboard payload and a ground station. It also executes housekeeping tasks and telecommand operations. This systems was, in particular, utilized in the balloon mission PEROBA-I. The performance of the system in the mission was satisfactory. T.M.

ANALYSIS OF BUILT-IN-TEST (BIT) FALSE ALARM CONDITIONS Final Technical Report, 24 Jan. 1980 - 28 Feb. 1981
John G. Malcolm and Richard W. Highland Griffiss AFB, N.Y. RADC Aug. 1981 122 p refs
(Contract F30602-80-C-0074; AF Proj. 2338)
(AD-A108752; RADC-TR-81-220) Avail: NTIS HC A06/MF A01 CSCL 14/2

Usefulness of BIT is seriously affected by the presence of false alarms. False alarms can degrade mission effectiveness of systems and contribute to the expenditure of excessive maintenance resources. The objectives of this study were to determine the root causes of the false alarm problem and to develop design guidelines to minimize the occurrence and the effect of false alarms. False alarm rates have been established for the three systems investigated and prediction factors defined. Author (GRA)

ANALYTICAL STUDY OF COCKPIT INFORMATION REQUIREMENTS Final Report, Oct. 1979 - Nov. 1980
J. D. Caldwell and T. G. Jones Washington FAA Apr. 1981 165 p refs
(Contract DOT-FA79WA 4368)
(AD-A108524; LG80ER0200; FAA/RD-81/4) Avail: NTIS HC A08/MF A01 CSCL 01/3

An assessment is made of cockpit information requirements likely to be imposed on aircraft in the next fifteen years as a result of improvements in the ATC system and in aircraft design. These requirements are analyzed by work centers and include flight control, navigation, collision avoidance, flight management, communications, caution/warning and monitoring, and checklist functions. From a baseline of current requirements and technology, the application of new requirements and technology is analyzed. Three aircraft are hypothesized representing three time periods of technical development. The purpose is to investigate the impact of future ATC changes on differently equipped aircraft. GRA

IMPACT OF TECHNOLOGY ON AVIONICS COST TRENDS
Steven Toth, William Lovelace, and Kelly Markin Nov. 1981 84 p
(Contract DTFA-01-80-C-10030)
(AD-A108494; Rept-1378-40-2-2553; FAA-EM-82-6) Avail: NTIS HC A05/MF A01 CSCL 09/3

This study provides an overview of nonmilitary generally aviation and commercial avionics price and cost structures as influenced by technology. It quantifies, computes, and evaluates the unique characteristics and behavior patterns of the industry, especially those that affect the frequency of innovation, the rate of technology diffusion from manufacturer to manufacturer or from product to product, and the anticipated major cost drivers of the future. The report reviews the impact of technology on the cost of avionics during the past 20 years and projects this impact for the next 20 years. This report concentrates on avionics in the low-performance general aviation aircraft category because they are the major components of the avionics industry. Typical units of detailed study are transponders, transceivers, navigation receivers, and course deviation indicators (CDIs). An examination of the price histories of more than twenty equipment families indicates that unit prices have been and are likely to continue increasing at the Producer Price Index (PPI) rate. This rate of price growth results from a balance between costs rising at the Consumer Price Index (CPI) rate and manufacturing cost reductions made possible through the introduction of new technologies. TRENDS IN AIRLINE AVIONICS
F. J. Abbink 13 Mar. 1980 30 p refs Presented at Netherlands Assoc. of Aeron. Engr. Symp. on Develop. in Avionics, Delft, 25 Apr. 1980
(NLR-MP-80013-U) Avail: NTIS HC A03/MF A01

The evolution of aeronautical electronics is described. Trends towards system integration for airliners are indicated. The development of airline avionics specifications by the airlines and constructors is outlined. The design and function of avionics equipment, e.g., navigation aids, are explained. The Aeronautical Radio Incorporated 700 automatic flight system is introduced as an example of a system suited to the next generation of airliners. Radio navigation, communication and identification equipment are controlled by the digital frequency/function selection unit. Automatic flight control and auto-throttle functions are executed by flight control and thrust control computers. Author (ESA)

INTEGRATION OF COMPLEX SYSTEMS IN CURRENT AND FUTURE AIRCRAFT PROJECTS FOR THE EXAMPLE OF AVIONICS [INTEGRATION KOMPLEXER SYSTEME IN LAUFENDE UND ZUKUENFTIGE FLUGZEUGPROGRAMME AM BEISPIEL DER AVIONIK]
H. Haeuser 31 Jan. 1980 38 p In GERMAN
(MBB-UH-18-80-O) Avail: NTIS HC A03/MF A01

Equipment for electrical and avionic systems, and special equipment needed in the airplane program were developed. Avionics is defined as: airplane structure, airplane equipment (besides the mechanical system) includes that part of the equipment system which is supported by the electric and electronic system, and construction and general instruments necessary in airplane construction. Avionics enables the supply, transfer, processing, and production (activation) of information for the management of airplane systems, control of airplanes, and the execution of special functions. EFFECTS OF FAN INLET TEMPERATURE DISTURBANCES ON THE STABILITY OF A TURBOFAN ENGINE
Mahmood Abdelwahab Dec. 1981 36 p refs
(NASA-TM-82699; E-982) Avail: NTIS HC A03/MF A01 CSCL 21E

The effects of steady-state and time-dependent fan inlet total temperature disturbances on the stability of a TF30-P-3 turbofan engine were determined. Disturbances were induced by a gaseous-hydrogen-fueled burner system installed upstream of the fan inlet. Data were obtained at a fan inlet Reynolds number index of 0.50 and at a low-pressure-rotor corrected speed of 90 percent of military speed. All tests were conducted with a 90 deg extent of the fan inlet circumference exposed to above-average temperatures. T.M.

(AD-A108223; Rept-80SRC82; AFWAL-TR-81-3074) Avail: NTIS HC A14/MF A01 CSCL 01/3

A total systems approach methodology and computer-aided design tool for integrated flight control design and evaluation has been formulated. This methodology is a composition of classical system design steps and system performance, reliability/survivability, packaging and cost evaluation techniques assembled for interactive computer-based execution. The interactive sensor integration program developed under this methodology addresses the sensor requirements of the flight control, guidance and navigation, and weapon delivery functions as directed interactively by the designer and the mission, the system configuration, cost, power, weight, volume constraints and total system performance. The demonstration program contains performance reliability, size, power, weight, cost data for gyros, accelerometers, radars, seekers and air data systems in addition to analysis tools for evaluating navigation system accuracy, probability of target acquisition, and probability of kill for selected targets and weapons. INVESTIGATION INTO THE UTILITY OF SOME QUICK SETTING CEMENTS FOR RUNWAY REPAIR [ONDERZOEK NAAR DE BRUIKBAARHEID VAN ENKELE SNELVERHARDENDE BINDMIDDELEN VOOR REPARATIE VAN STARTBANEN]

Mar. 1980 39 p refs In DUTCH
(B-80-157/60.7.0157; TDCK-75056) Avail: NTIS HC A03/MF A01

The application of quick setting cements in rapid runway repair was investigated. Needed strength and layer thickness of the hardening material was determined. The following results are reported: (1) it is possible to fill up a hollow space with quick setting cements, even in combination with proper additives like super plastifiers; (2) pressure strength for hardening time is accomplished within one hour; (3) a fast operating method is needed to prevent debinding of cement, continuous mixers for smaller quantities are recommended. THE LINK-HILES DRIVER TRAINING SIMULATOR FOR TRACKED VEHICLES: THE EFFECT OF METHOD AND DURATION OF TRAINING ON THE TRANSFER OF TRAINING

K. J. Poll 1980 20 p refs In DUTCH; ENGLISH summary
(Contract A76/KL/148)
(IZF-1980-28; TDCK-75019) Avail: NTIS HC A02/MF A01

Transfer of training through different methods and durations of training from a driving simulator to a task was investigated. In method A the candidates were under strict guidance of the instructor, while in method B the candidates trained more on their own and paid more attention to the integration of the part-tasks. The duration of training was dependant on the performance-level on which the candidate turned over from the simulator to the real tanks. These performance-levels were: the single trial execution of all tasks (low level), having all tasks under control (medium level), and sufficient integration of all part-tasks (high level). From the results it is clear that when the candidates were trained in pairs the mean number of kilometers for the two candidates shows to difference as a function of training method. Although the 'first' candidate needs less kilometers with method B, and 'second' candidate learns more from the 'first' with method A. The number of kilometers on the tank, necessary to pass the final driver's test, is a linear relation as a function of the duration of simulator training. J.M.S.

TASK ANALYTIC TECHNIQUES: APPLICATION TO THE DESIGN OF A FLIGHT SIMULATOR INSTRUCTOR/OPERATOR CONSOLE Final Report

Charles D. Sanders Brooks AFB, Tex. Air Force Human Resources Lab. Dec. 1981 21 p refs Prepared for Southeastern Center for Electrical Engineering Education, St. Cloud, Fla. Submitted for publication
(Contract F49620-79-C-0038; AF Proj. 9983)
(AD-A108724; AFHRL-TP-81-38) Avail: NTIS HC A02/MF A01 CSCL 14/2

Instructional Systems Development (ISD) has contributed to the efficiency and low cost of air flight training through the medium of the simulator. Task analysis is a component of ISD, and its application to the improvement of devices such as simulator instructor/operator consoles will continue to enhance the quality of flight training. Task analytic techniques are inextricably interwoven into the design of an instructor/operator console. The application involves the process, persons, and a machine within the context of a flight simulator. The tasks of the instructor and student are primary in the design process. The efficiency and economy of the task analytic process has implications for its use in the future developments of automated flight training. Author (GRA)

EVALUATION OF THE NORTH ISLAND A/C CRASH/RESCUE TRAINING FACILITY

R. S. Alger Aug. 1981 153 p refs
(Contract N00014-80-C-0696; SRI Proj. PYU-1943)
(AD-A108740) Avail: NTIS HC A08/MF A01 CSCL 05/9

Under Executive Order 11752, the Navy and the Air Force began a cooperative effort to develop training facilities that could provide more fire fighting training with less smoke and water pollution. Soon the central issue of pollution control was surrounded by a series of satellite questions that had to be answered before training facilities could be designed, e.g., what type of training is required; how much training should be provided; where should fireman train; and how much departure from the real emergency situation is permissible. Various public and private groups contributed answers. The Naval Air Station, North Island, San Diego, Calif., Aircraft/Crash Fire Rescue Training Facility is the first Navy facility constructed as an outgrowth of this effort to improve training while reducing the environmental impact to an acceptable level. This report evaluates the performance of the North Island facility in a series of environmental and training tests. The scope includes: (1) the evaluation procedure and results; (2) a comparison to other training options; and (3) recommendations for future training activity. GRA

BOMB CRATER REPAIR TECHNIQUES FOR PERMANENT AIRFIELDS. REPORT 1: SERIES 1 TESTS Technical Report, Jul. - Nov. 1978

David L. Cooksey Oct. 1981 129 p refs
(AD-A108716; WES/MP/GL-81-12) Avail: NTIS HC A07/MF A01 CSCL 13/2

A test section with six simulated bomb craters was constructed for the purpose of developing an improved field method of repair and restoration of air base runways damaged by enemy attack. The crater repair materials tested in the reconstruction were a high-quality crushed stone, grouted concrete, portland cement concrete (PCC), and asphaltic concrete (AC). The performances of the different materials were evaluated under full-scale load testings with the F-4 and C-141 aircraft loadings. The gravity grout solution and the high-quality crushed stone method performed beyond required coverage levels and seem to be the two high candidate material systems for further research. The solutions were accomplished with the time.

AN EXTENSION OF THE LOCAL MOMENTUM THEORY TO THE ROTORS OPERATING IN TWISTED FLOW FIELD

Akira Azuma, Ken-ichi Nasu, and Takatoshi Hayashi *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 19 p refs
Avail: NTIS HC A99/MF A01

The local momentum theory was developed to calculate the dynamic airloading of a helicopter rotor, where the velocity perpendicular to the plane of rotation was assumed to be negligibly low in comparison with the rotating velocity. In the case of propellers or windmills, however, this assumption is no longer adequate, and the flow field seen in the rotor-fixed-coordinate system is noticeably twisted along the span. In order to permit calculation of the induced velocity distribution as well as the airloading of the blade in such a twisted flow field, we have carried out an extension of the local momentum theory. Since our method of calculation is based on the instantaneous circulation distribution rather than the instantaneous momentum balance, it may be called the Local Circulation Method. The present method is also applicable to propellers and windmills in yawed flow. Author

N82-18124# Nanjing Aeronautical Inst. (China).
A SIMPLIFIED METHOD FOR PREDICTING ROTOR BLADE AIRLOADS
Wang Shi-cun and Xu Zhi *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 28 p refs

Avail: NTIS HC A99/MF A01

Relations of first two harmonic induced velocities to the lower and same-order harmonic circulations are obtained from the generalized classical vortex theory of the rotor. Then, based on the blade element theory, a closed form of equations for circulation is established and, by taking the flapping condition into account, simplified formulae for predicting rotor blade airloads are set up. In particular, expressions of flapping coefficients are derived, including the effect of variable induced velocity distribution but in terms of blade parameters and flight parameters only. Finally, a calculation of a typical example is made and comparisons of airloads with those from the more accurate numerical solution are shown that the present method is fairly suitable for aerodynamic analysis and preliminary design of helicopters. A THREE-DIMENSIONAL APPROACH TO LIFT AND MOMENT COEFFICIENTS OF ROTATING BLADES
Wolfgang Send *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 16 p refs (For primary

Avail: NTIS HC A99/MF A01

The three dimensional incompressible flow around a thick blade is calculated in the limiting case of an infinitely high Reynolds number. The solution for a four bladed rotor is achieved by interacting the mutual influence of the induced velocities on the blades. Several properties of the three dimensional approach are compared with two dimensional theories. Unsteady results are obtained by combining the quasi-steady flow with the calculation for a given oscillation mode. The integral equation for the flow around the blades is solved by a higher order panel technique for the vorticity vector, continuous on the blade and downstream in the wake. An improper description of the wake integral is evident. The helical wake is substituted by its rectilinear counterpart, for which an analytical description was found. N.W.

INVESTIGATION OF COMPACTION CRITERIA FOR AIRPORT PAVEMENT SUBGRADE SOILS Final Report, Mar. 1978 - Apr. 1981
William N. Brabston Washington, D.C. FAA Oct. 1981 174 p refs
(Contract DOT-FA78WAI-876)
(AD-A108518; WES/TR/GL-81-11; FAA-RD-81-48) Avail: NTIS HC A08/MF A01 CSCL 08/13

A study was conducted to determine the effect of lowering soil density requirements for subgrades under airport pavements. The investigation was primarily a laboratory effort in which molded specimens of three different soil types, compacted to densities at and below those currently specified by FAA criteria, were subjected to repeated axial loadings in a triaxial compression chamber. The primary response parameters of interest were permanent and resilient axial strain. Test results were formulated into a statistical model to predict permanent soil strain based on soil characteristics such as density, clay content, compaction characteristics, and sheer strength. The strain model was used to calculate values of permanent soil deformation at the surface of the subgrade for various combinations of soil density. Results of the test indicated that the wide variation in soil response among the three materials tested precluded any general alteration in current FAA compaction criteria. Author (GRA)

This report documents the current version in the C81 family of rotorcraft flight simulation programs developed by Bell Helicopter Textron. This current version of the digital computer program is referred to as AGAP80. The accompanying program for calculating fully coupled rotor blade mode shapes is called DNAM05, and an associated rotor wake program is called AR9102. The AGAP80 version of C81 was developed by adding some analytical features to the AGAJ76 version and including the ability to generate Data Transfer Files for use by the File Creation Program of DATAMAP. An overview of the computer program capabilities and the principal mathematical models incorporated in the program are given in Volume I of the documentation for the AGAJ76 version of the program. Volume I, the User's Manual, contains detailed information necessary for setting up an input data deck and interpreting the computed data. Volume II, includes a catalog of subroutines and a discussion of programming considerations. GRA

The periodic testing and evaluation of graphite/epoxy and Kevlar/epoxy material systems after subjecting test specimens to prolonged exposure to several laboratory-controlled environments deemed typical of normal aircraft operations is discussed. It is noted that specimen immersion in water or water-based fluids resulted in the greatest effect on the mechanical properties tested. Also, the environmental fluids showed a tendency to affect Kevlar/epoxy systems at an earlier exposure period than the graphite/epoxy systems. Results also indicate mechanical property strength retention generally being lower for the Kevlar/epoxy systems when compared to the corresponding graphite/epoxy systems in similar environments, after prolonged exposure. Flight control-related apparatus for damping operator induced oscillations of a controlled system responding to an operator controlled signal is described. The device utilizes a lag-lead filter for frequency and amplitude estimation of the control input, and a rectification and smoothing filter for producing a signal proportional to the absolute value of the frequency and amplitude estimate for use in suppression of the control system output signal. In one embodiment, this is accomplished by computing a correction signal in a correction generating section. In a second embodiment, a second rectification and smoothing filter produces a signal proportional to the absolute value of the controlled input signal. A ratio of the outputs of the first and second rectification and smoothing filters is then used in a generator to generate a gain factor k sub q for the control system to reduce the gain of the output signal of the control system, thereby to provide a damped control output signal without rate limiting the controlled element.

A DESIGN FOR A 32-CHANNEL MULTIPLEXER
P. F. Martinson 26 Jan. 1981 35 p refs
(RAE-TM-RAD-NAV-145; BR77700) Copyright. Avail: Issuing Activity

A time scan analog system multiplexer used for recording data during flight trials of unmanned aircraft navigation sensors is described. The 32 inputs are buffered, then multiplexed in groups of 8 onto 4 lines. These four are multiplexed onto one line and the signal passes through the output buffer to the recorder. Aircraft attitude, heading and height are recorded. Signals from a camera and a kinetheodolite tracking system are synchronized. Operating conditions were simulated using a helicopter. Noise and drift are due to the recorder. The multiplexer copes well with signals of several kHz bandwidth (raw data) and signals of a few Hz bandwidth (processed data, test signals). It can be used with any multitrack tape recorder having an FM recording format on at least two tracks. It can be converted for use in a digital telemetry system. Author (ESA)

Recovery and upgrading of low-grade steam or waste heat sources offers a great potential of energy conservation. Thermo Electron is developing an open cycle vapor compression steam heat pump to meet this objective. The system utilizes excess low-pressure steam or that produced from an industrial excess heat source with a waste heat boiler and compresses this steam to the desired pressure level for process use. The compressor is driven by a prime mover such as a gas turbine, gas engine, etc. The prime mover exhaust heat also can be recovered to generate additional process steam. The fuel consumption of this system can be as low as 30 to 50 percent in comparison to a direct-fired boiler over the expected range of process conditions. Simple payback periods as low as one year can be achieved. GRA

(NASA-CR-168519) Avail: NTIS HC A06/MF A01 CSCL 04B

Severe storm aircraft measurements are documented, as well as the instrumentation and operational features of aircraft mobility capabilities. The measurements and data analyses indicate that the concept of a highly mobile research aircraft capability for obtaining detailed measurements of wind, temperature, moisture, spherics, etc., near and within severe storm systems, forecast 48 hours in advance in a 1000 nm operating radius, is feasible, and was successfully demonstrated. The measurements and analyses reveal several severe storm features and insights with respect to storm air flow circulations and inflow-outflow

ELEMENT APPROACH AND MEASUREMENT BY GROUND VIBRATION TEST
D. Ludwig *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 23 p refs

Avail: NTIS HC A99/MF A01
The mass and stiffness matrices for a rotating blade are established by the finite element method. The formulation is based on the Lagrange function for combined flapwise bending, chordwise bending, and torsion of twisted nonuniform rotor blades. The element matrices are created by the non-numeric computer program REDUCE. An ordering scheme was introduced to demonstrate which terms may be simplified or neglected. As examples, eigen analyses, with the finite element computer program, are performed for a homogeneous beam and for the nonrotating blade of a wind energy converter. The results of the calculations for the beam are compared with the analytical solutions. The rotor blade of the wind energy converter was tested in a ground vibration test. A short description of the ground vibration test technique and performance is given. N.W.

A STUDY OF THE TECHNIQUES OF DYNAMIC ANALYSIS OF HELICOPTER TYPE STRUCTURES
G. M. Venn and D. J. Boon *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 21 p

Avail: NTIS HC A99/MF A01
The techniques used in the dynamic analysis of helicopter type structures using finite elements are discussed. A test structure was designed and built which incorporated many design features found in helicopter structures. Experiments were performed on this structure to determine the natural frequencies and normal modes. These experimental results were compared with theoretical finite element results. Altering the build state added one or two extra problems so that these could be studied. The modelling problems investigated were: riveted panel-stringer constructions, deep fabricated beams, discontinuous load paths, bolted joints, honeycomb panels, gearboxes, engine mounts, and engines. The techniques used to model these features are discussed. Problems were found when attempting to compare the theoretical and experimental results. N.W.

THE EFFECTS OF SLIGHT NON-LINEARITIES ON MODAL TESTING OF HELICOPTER-LIKE STRUCTURES
D. J. Ewins (Imperial College of Science and Technology) *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 11 p refs

Avail: NTIS HC A99/MF A01
A comprehensive series of modal tests was made on a specially built test piece designed to simulate many of the characteristics of helicopter structures. These tests identified the presence of a 'slight' degree of nonlinearity and further established that this almost unnoticed effect causes significant discrepancies in the modal properties deduced from measured data. However, systematic analysis of the measurements may be used to isolate the nonlinear effects and to eliminate them from the results. Author

PARAMETRIC STUDY OF THE INFLUENCE OF THE ENGINE UPON THE OPERATING COST OF A CIVIL HELICOPTER

Gilbert Beziac, Jean-Pierre Dedieu, and Philippe Cabrit *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 5 p
Avail: NTIS HC A99/MF A01
The influence of engine characteristics (weight, fuel consumption, price, power range) upon the helicopter operating cost were studied. The parametric relationship between the various factors were defined. Several engine alternatives for a medium weight helicopter were compared. The following conclusions were made: (1) a sufficient power reserve is necessary but too high a value is not profitable; (2) the fuel consumption should be the result of a compromise: interest of a low value, engine complexity, reliability; and (3) a substantial increase in helicopter cost effectiveness is obtained thanks to a simultaneous evolution of aircraft and engine. PREDICTION OF OFF-DESIGN PERFORMANCE OF TURBO-SHAFT ENGINES A SIMPLIFIED METHOD
H. Wittenberg *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 16 p refs

Avail: NTIS HC A99/MF A01
Estimation of the off-design performance of a given gas turbine is generally based on detailed performance characteristics of compressor and turbine(s). An approximate method for the estimation of the off-design behavior of turbojet and turbofan engines was developed using thermodynamic relationships only. The method is based on a matching procedure with generalized mass flow characteristics of the turbine(s) or exhaust nozzle(s). The method was adopted to turbo-shaft engines for this study. Examples are given for an actual engine type. There is fair agreement between the calculated off-design performance and the data derived from the manufacturer's engine brochure. M.D.K.

MEASUREMENT TECHNIQUES USED TO ASSESS THE INSTALLED POWER OF A HELICOPTER ENGINE
T. G. Morton *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 16 p Original contains color illustrations

Avail: NTIS HC A99/MF A01
To improve helicopter performance predictions, it is important to quantify any change in engine performance between the test bed and 'as installed' in the aircraft, and to attribute the reasons for any change as accurately as possible. Measurement techniques used to quantify performance for a particular Rolls-Royce Gem Engine installation is discussed. Extra sensors were added to engines in a production Lynx helicopter which was fitted with recorder equipment in the cabin and flown to a defined schedule. If the engine is considered as a thermodynamic unit, the input/output equation must balance. Test point data based on these inlet and exhaust conditions were obtained from both test bed and flight tests. Analysis of results when compared to a thermodynamic model of the engine, shows that the resultant data is very sensitive to the quality of measurements and will quickly show the deviation from predicted characteristics. THREE-ENGINE CONTROL SYSTEM FOR THE PROTOTYPE EH-101 HELICOPTER
E. A. Chiuchiolo and J. J. Curran *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft 1981 10 p refs

(AEBG-9/81-1568L) Avail: NTIS HC A99/MF A01
The T700 control system configured for installation in the three-engined WG.34A helicopter (prototype for European Helicopter Industries EH-101) provides for a versatile control system which may be operated normally to provide the helicopter propulsion or may be operated as a totally independent system to power airframe avionics and power accessories. It is designed to maintain constant speed for accessories or load share with second and third engines and is independent of position in the aircraft. The total system is automatic and provides not only constant rotor speed but also closely matched torques. Modifica-

tions made to the T700 control system to provide the above capabilities are discussed. Discussion of the need for these modifications and the present status of the design is also designed. Author

ENGINE SUPERFICIAL TEMPERATURE AND INFRARED SIGNATURE
A. M. Ricci, A. N. Allavena, and W. Esposti (I.C.I.T.E., S. Giuliano Milanese, Italy) *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 17 p

Avail: NTIS HC A99/MF A01

A system calibration and data processing method was set up to provide spatial information on temperature and a spatially accurate radiant intensity map under different angles. The methodology was developed to evaluate the thermal exchange between engine and engine-cowling and their infrared signature in the 1 - 6 micrometer range in order to evaluate special infrared treatment to reduce infrared emission. The infrared imagery camera was coupled to an analogic/digital data acquisition system. Calibration studies were conducted in an infrared laboratory to provide the absolute calibration on the thermograph in the previously defined spectral range. The results are presented in profiles of temperature and radiance. Author

POINT OF VIEW OF A HELICOPTER MANUFACTURER ON AIRWORTHINESS REGULATIONS
Jean Boulet *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 5 p

Avail: NTIS HC A99/MF A01

Helicopter airworthiness regulations are discussed. The need for airworthiness regulations to be drafted and modified through a process of constant consultation between Civil Aviation Authorities and manufacturers is discussed. The need to introduce the concept of probability to be able to come closer to the actual risks and to avoid penalizing aircraft with useless systems and demonstration requirements is also considered. It is suggested that these regulations tend toward one single international set of regulations and one single demonstration of compliance with the regulations. The possibility of reconciling a continuously improved safety level and a progressive reduction in helicopter costs is also considered. M.D.K.

MILITARY REQUIREMENTS: TOO LITTLE OR TOO MUCH
Emidio Valente *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 18 p

Avail: NTIS HC A99/MF A01

Concepts useful for a better understanding of the military requirements, operational requirements for helicopters are discussed. The need for an understanding between military operators of rotary-wing aircraft, helicopter designers, and manufacturers is considered. Two viewpoints are summarized: (1) The helicopter is a weapon system featuring the same indispensability level of all other systems required to integrate the battlefield. (2) The helicopter must be designed to reflect military requirements which cover all those elements likely to condition its operation, this is to say: operational environment, human factor, and economical aspects. The following considerations are recommended for further investigation: (1) whether commercial operators are really affected and (2) whether solutions can be found which in the end prove to be a saving rather than a deterioration in cost, weight and complexity. M.D.K.

PARAMETRIC CRITERIA AND IMPACT ON DESIGN TRENDS
Roberto dePompeis and Fulvio Gagliardi (Ministry of Defence) *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 25 p refs

Avail: NTIS HC A99/MF A01

Laws or trends of typical parameters which contribute to the definition of an 'ideal' specific helicopter which can be used as a reference model and give a nondimensional measure of effectiveness are discussed. Operative requirements, taking into account the main factors affecting missions were transferred into a mathematical model. The procedure was derived from theoretical studies already applied to aircraft selections and consists of three main steps: (1) Effectiveness program; (2) Total operating cost estimation; and (3) Evaluation of effectiveness-cost ratio and optimization of the fleet selection. All costs (manufacturing, maintenance, training, operating, etc.) for the operative life are estimated with a similar methodology and lead to the determination of the effectiveness-cost ratio which may be optimized taking into account the fleet consistency required to fulfill the task. DESIGN PHILOSOPHY OF THE HUGHES MODEL 600 HELICOPTER
R. S. Taylor *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 16 p

Avail: NTIS HC A99/MF A01

The design philosophy of a new model helicopter, the Hughes model 600X, which took into consideration a number of factors is discussed. The following subjects are discussed and a rationale for the selected approach is given: (1) whether to grow or develop a totally new configuration. To be cost effective, a growth helicopter would need to produce significant additional advantages which would be offset by the ever present compromises of the old design; (2) how to grow an 'egg', especially one with internal structure; (3) how to replace the old model or is the new model to be produced in addition to the old one; and (4) how is the market potential to be assessed. Details of approaches are presented with reasons for accepting or rejecting each one. Results of market analysis and response of the helicopter public is presented to show the viability of the selected configuration. M.D.K.

DEVELOPMENT OF A CLEAR AIR RADAR TO DETECT METEOROLOGICAL HAZARDS AT AIRPORTS Final Report, 1 Oct. 1978 - 21 Sep. 1981

R. B. Chadwick, K. P. Moran, W. C. Campbell, K. B. Earnshaw, and T. R. Detman 21 Sep. 1981 113 p refs
(Contract ESD-0-0630; AF Proj. 6670)
(AD-A108238; AFGL-TR-81-0268) Avail: NTIS HC A06/MF A01 CSCL 17/9

To be useful in detecting meteorological hazards such as low-level wind shear near airports, a radar must be able to: (1) detect backscatter from both clear air and rain; (2) operate at short ranges and low elevation angles; and (3) measure Doppler frequencies caused by air motion. The development of a radar with these characteristics is described and the results of testing this radar at airports are presented. Special emphasis is placed on the problems of low elevation angle operation and clutter suppression. The importance of proper siting is pointed out. In addition, it is demonstrated that the radar can readily detect the turbulent wakes of large jet aircraft. Author (GRA)

A-7E SOFTWARE MODULE GUIDE Interim Report

K. H. Britton and D. L. Parnas 8 Dec. 1981 36 p refs
(AD-A108649; NRL-MR-4702) Avail: NTIS HC A03/MF A01 CSCL 09/2

This document describes the basic organization of NRL's version of the A-7E onboard flight software. The report describes a structure in which modules have been designed in accordance with the Information Hiding Principle. Because of the larger number of modules that result when this principle is applied, the modules are arranged in a hierarchy. The hierarchy should simplify the task of a maintenance programmer assigned to make a specific modification. The document also describes the principles used in the design of the software. It is intended to be useful both as a guide to the A-7E software and as a model for those developing other software systems. Author (GRA)

A PROGRAM TESTING ASSISTANT

David Chapman Nov. 1981 25 p refs
(Contract N00014-80-C-0505)
(AD-A108147; AI-M-651) Avail: NTIS HC A02/MF A01 CSCL 09/2

This paper describes the design and implementation of a program testing assistant which aids a programmer in the definition, execution and modification of test cases and executes them automatically when appropriate. It modifies test cases to preserve their usefulness when the program they test undergoes certain types of design changes. The testing assistant acts as a fully integrated part of the programming environment and cooperates with existing programming tools, including a display editor, compiler, interpreter, and debugger. STUDY OF CABIN NOISE CONTROL FOR TWIN ENGINE GENERAL AVIATION AIRCRAFT

R. Vaicaitis and M. Slazak Hampton, Va. NASA. Langley Research Center Feb. 1982 147 p refs
(Contract NAS1-16117)
(NASA-CR-165833; MAI-1) Avail: NTIS HC A07/MF A01 CSCL 20A

An analytical model based on modal analysis was developed to predict the noise transmission into a twin-engine light aircraft. The model was applied to optimize the interior noise to an A-weighted level of 85 dBA. To achieve the required noise attenuation, add-on treatments in the form of honeycomb panels, damping tapes, acoustic blankets, septum barriers and limp trim panels were added to the existing structure. The added weight of the noise control treatment is about 1.1 percent of the total gross take-off weight of the aircraft. B.W.

ANNOYANCE CAUSED BY PROPELLER AIRPLANE FLYOVER NOISE: PRELIMINARY RESULTS

David A. McCurdy and Clemens A. Powell Dec. 1981 35 p refs
(NASA-TM-83244) Avail: NTIS HC A03/MF A01 CSCL 20A

The annoyance response of people to the noise of propeller airplane flyovers was examined. The specific items of interest were: (1) the annoyance prediction ability of current noise metrics; (2) the effect of tone corrections on prediction ability; (3) the effect of duration corrections on prediction ability; and (4) the effect of 'critical band' corrections on the prediction ability of perceived noise level. Preliminary analyses of the data obtained from two experiments are presented. The first experiment examined 11 propeller airplanes with maximum takeoff weights greater than or equal to 5700 kg. The second experiment examined 14 propeller airplanes weighting 5700 kg or less. Also included in each experiment were five different commercial service jet airplanes. Each airplane noise was presented at D-weighted sound pressure levels of 70, 80, and 90 dB to subjects in a testing room which simulates the outdoor acoustic environment. Subjects judged 108 stimuli in the first experiment and 132 stimuli in the second experiment. Perceived noise level predicted annoyance better than A, D, or E-weighted sound pressure level. Corrections for tones greater than of equal to 500 Hz generally improved prediction ability for the heavier propeller airplanes. B.W.

TETHERED ROTORPLATFORMS AND THEIR MISSION POTENTIAL

W. Goeller *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 13 p

Avail: NTIS HC A99/MF A01

A definition of tethered rotorplatforms is given and the main objectives that are pursued with these vehicles are presented. A short retrospect on rotorplatform history is given. The Dornier 'Kiebitz' is described. It is designed to lift payloads for battlefield surveillance, air defense, EW or communication to some hundred meters above ground for long mission times. A very small tethered rotorplatform for elevating electro optical sensors of 5 to 10 kg is described. The energy for its flight time of about 70 seconds is stored in a massive momentum ring surounding its rotor. Finally, a proposed rotorplatform with an electric drive system for payloads of about 30 kg for target acquisition and target designation, is also discussed. M.D.K.

N82-18146# Southampton Univ. (England).

WIND TUNNEL INVESTIGATION OF HIGH SPEED ROTOR NOISE

H. Tadghighi and I. C. Cheeseman *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 25 p refs

Avail: NTIS HC A99/MF A01

A high speed model rotor (tip Mach number of 0.75) was developed to investigate tail rotor noise in forward flight conditions. The existing 2.1 by 1.5 m low speed (30 m/sec) closed circuit wind tunnel was modified and utilized to enable acoustic measurements of forward flight to be made. Check tests in the 24 ft anechoic wind tunnel show excellent agreement with the development tests. The model rotor noise data are found to correlate wall with full scale helicopter rotor values. Simultaneously recorded aerodynamic performance of the model rotor (blade loading, steady thrust, torque and trimmed moments) is compared with theoretical aeroacoustic treatments. It is concluded that the model rotor accurately simulates full scale rotor aeroacoustic data. J.M.S.

PREDICTION OF BLADE VORTEX INTERACTION NOISE FROM MEASURED BLADE PRESSURE

Yoshiya Nakamura *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 20 p refs Sponsored by NASA

Avail: NTIS HC A99/MF A01 CSCL 01A

The impulsive nature of noise due to the interaction of a rotor blade with a tip vortex is studied. The time signature of this noise is calculated theoretically based on the measured blade surface pressure fluctuation of an operational load survey rotor in slow descending flight and is compared with the simultaneous microphone measurement. Particularly, the physical understanding of the characteristic features of a waveform is extensively studied in order to understand the generating mechanism and to identify the important parameters. The interaction trajectory of a tip vortex on an acoustic planform is shown to be a very important parameter for the impulsive shape of the noise. The unsteady nature of the pressure distribution at the very leading edge is also important to the pulse shape. The theoretical model using noncompact linear acoustics predicts the general shape of interaction impulse pretty well except for peak amplitude which requires more continuous pressure information along the span at the leading edge. Author

PRELIMINARY THOUGHTS ON HELICOPTER CABIN NOISE PREDICTION METHODS

J. S. Pollard *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 14 p refs

Avail: NTIS HC A99/MF A01

The problems of predicting helicopter cabin noise are discussed with particular reference to the Lynx helicopter. Available methods such as modal analysis adopted for propeller noise prediction do not cope with the higher frequency discrete tone content of helicopter gear noise, with the airborne and structure-borne noise contributions. Statistical energy analysis methods may be the answer but until these are developed, one has to rely on classical noise transmission analysis and transfer function methods. Author

THE MEASUREMENT OF THE MOBILITY OF STRUCTURES AT ACOUSTIC FREQUENCIES

Susan M. Damms *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 21 p refs

Avail: NTIS HC A99/MF A01

The development of a technique to measure the response of structures to vibrational input forces and moments is described. So far, simple structures with known properties have been used but it is intended to apply the technique in the design of an interface which isolates vibrationally the gearbox of a helicopter from the cabin at acoustic frequencies. In a first experiment, no moments were applied. The main object was to demonstrate that measurements could be made on two components of a structure with sufficient accuracy to correctly predict measurements on the assembled structure. The two components were a beam and a dynamic absorber. In a second experiment a special block was attached to a beam to enable forces and moments to be applied and translations and rotations to be measured. The particular mobilities measured .were chosen so that they could be easily compared with theory and also with measurements without a block. J.M.S.

FLIGHT CHARACTERISTICS DESIGN AND DEVELOPMENT OF THE MBB/KHI BK117 HELICOPTER

H. Huber and T. Masue (Kawasaki Heavy Industries) *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 21 p refs

Avail: NTIS HC A99/MF A01

The BK 117 light, twin-engine helicopter was designed to provide high flexibility of operations, attractive performance characteristics, and outstanding handling qualities. Dominant features result from the hingeless rotor system, which provides inherent high control power and high angular velocity damping. Further optimization is achieved through refinement of the fuselage aerodynamic design, and by a proper layout of the empennage configuration, taking into account the interactional aerodynamic phenomena. The particular design features and their impact on the helicopter flight characteristics are described. The results obtained in the areas of static and dynamic stability (longitudinal, lateral directional), control response and maneuver characteristics, aeromechanical stability and loads and vibrations are presented, including correlation of flight test data with computer model simulations. J.M.S.

A GENERAL PURPOSE PROGRAM FOR ROTOR BLADE DYNAMICS

M. Borri, M. Lanz, and P. Mantegazza *In* DGLR Seventh European

Rotorcraft and Powered Lift Aircraft Forum 1981 15 p refs

Avail: NTIS HC A99/MF A01

A computer program for rotor blade dynamics capable of dealing both with hinged and hingless rotors, suitable for steady state flight analysis and stability evaluation was developed. Blade motion is represented by finite elements in the space-time domain, covering the span of one or more rotor revolutions, and allowing for different nonlinearities. This method gives a flexible unitary approach for the very different model complexities required by the different design phases, such as the simplest rigid blade schemes, and the more sophisticated ones including nonlinearities arising from large blade flexibilties and large movements in control links. The aerodynamics, at the present development state, considers prescribed wake geometry and blade element theory, including stall and compressibility effects. J.M.S.

A CONTROL MODEL FOR MANEUVERING FLIGHT FOR APPLICATION TO A COMPUTER-FLIGHT TESTING PROGRAM

H. Haveridings *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 16 p refs

Avail: NTIS HC A99/MF A01

A computer-flight-testing (CFT) program for helicopters to evaluate helicopter dynamics and handling and control qualities is described. The nonlinear six degrees of freedom helicopter model is driven by control inputs generated by a specially developed control model (or 'pseudo pilot') to eliminate problems in estimating control inputs during maneuvering flight. This is an adaptation of a linear optimal control model as used in human factor analysis. The helicopter model is based on two-dimensional strip aerodynamics steady-state rotor blade dynamics using only out-of-plane bending mode shapes, which are suitable for various types of rotor articulation. The 'pilot' model consists of a flight path generation (FPG)-model and a stabilitization (STAB)-model. The FPG-model is based on linearized system dynamics using terminal optimal control, generating both required flight path and the control inputs to achieve it. These controls are input into the helicopter model. The two flight paths are compared, and differences are fed back to the STAB-model to generate corrective control inputs of such a nature that the helicopter-model-generated flight path tracks the required flight path generated by the FPG-model. Also the STAB-model is based on linearized system dynamics. As an example, two flare maneuvers are 'flown', and the results discussed. The pseudo-pilot model performs well, provided that helicopter dynamics do not change much during a specific maneuver. J.M.S.

PRELIMINARY INVESTIGATION INTO THE ADDITION OF AUXILIARY LONGITUDINAL THRUST ON HELICOPTER AGILITY

P. J. Legge, P. W. Forestcue (Southampton Univ.), and P. Taylor (Southampton Univ.) *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 17 p refs

Avail: NTIS HC A99/MF A01

The agility requirements in specific maneuvers performed by military helicopters are investigated. A simple mathematical simulation of the helicopter accelerating and decelerating longitudinally is used to examine the advantages of auxiliary thrust. For helicopters operating in the Nap-of-Earth environment the longitudinal acceleration and deceleration performance is shown to be uniquely important. Large improvements in agility, measured by a performance function, are obtained by adding auxiliary thrust. The need for the helicopter to change its attitude is drastically reduced, and the pilot workload improved. The type of flight profile used is also examined, using a nondimensional Froude number. There was no benefit in a 'maximum effort' flight profile, which consequently further improves the pilot workload. Auxiliary thrust improved agility performance by increasing the helicopter's ability to change position while maintaining precise attitude control. J.M.S.

OPTIMUM PERFORMANCE AND WAKE GEOMETRY OF CO-AXIAL ROTOR IN HOVER

Tomoari Nagashima and Kenji Nakanishi *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 17 p refs

Avail: NTIS HC A99/MF A01

Numerical studies to clear out the rotor-wake interference effects on the optimum performance and wake geometry of a coaxial rotor in hover are performed using the generalised momentum theory and the simplified free wake analysis. For applying the momentum concept to the performance predictions of the coaxial rotor system, each wake of rotors and flow fields around them are modeled so as to properly incorporate wake contractions, rotational velocities, and nonlinear mutual interference effects. In case of the free wake analysis, it is approximated by a finite number of discrete circular vortices whose numbers and core radii are deduced from the sensitivity analysis. The numerical results clearly show that the performances and its wake geometries are largely dependent on the axial spacings and the pitch differences between rotors and there are unique combinations of them which could produce the optimum performance. It is also understood that the upwash effect of the contracted upper rotor wake on the lower rotor plays a fundamental role to improve the hover performance with coaxial rotor arrangement. Author

A NUMERICAL APPROACH TO CO-AXIAL ROTOR AERODYNAMICS

Shigeru Saito and Akira Azuma *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 19 p refs

Avail: NTIS HC A99/MF A01

In the simple momentum theory, the aerodynamic characteristics of the lower rotor of a coaxial rotor system are usually evaluated under the highly deteriorated conditions caused by the fully developed wake of the upper rotor, specifically under the conditions of hovering flight. Analysis using the Local Momentum Theory not only shows the performance of the lower rotor to be higher than that calculated by the simple momentum theory but also makes it possible to calculate the instantaneous airloading of blades operating in a complex wake system. By introducing the radial shrinkage of the rotor wake, the accuracy of the analysis of blade airloading is further improved. The calculated results are compared with those of wind tunnel tests in both hovering and forward flights. In forward flight, the performance of the lower rotor improves not only with increases in the forward speed but also with increase in the vertical distance between the upper and lower rotors. In hovering flight, the improvement in the performance is not remarkable because the lower rotor is strongly influenced by the upper rotor wake. Author

MULTIVARIABLE AIRCRAFT CONTROL BY MANEUVER COMMANDS: AN APPLICATION TO AIR TO SURFACE GUNNERY
Binh DangVu *In its* La Rech. Aerospatiale, Bimonthly Bull. No. 1981-3, May-Jun. 1981 (ESA-TT-714) Oct. 1981 p 9-19 refs Transl. into ENGLISH of "La Rech. Aerospatiale, Bull. Bimestriel (Paris), No. 1981-3, May-Jun. 1981" p 149-159

Avail: NTIS HC A05/MF A01; original report in FRENCH available at ONERA, Paris FF 45

Aircraft control where pilot commands are variables directly related to aircraft motion in opposition to deflection angles of control surfaces is described. Linear optimal control theory is applied so as to improve flight qualities and reduce the work load of the pilot. A control system for sideslip, rate of roll, and rate of pitch was tested in numerical simulation and its efficiency for aiming in air-to-surface gunnery was assessed. Results show that control of the rate of pitch is well adapted for cancelling longitudinal aiming devitions, but that control of yaw rate is preferable to roll for cancelling lateral deviations. Another system obtained by integrating the flight control and fire control systems is also suggested. Author (ESA)

NATIONAL AIRSPACE DATA INTERCHANGE NETWORK (NADIN) SUPPORT OF REMOTE MAINTENANCE MONITORING SYSTEM (RMMS) Final Report
Dec. 1981 111 p refs
(Contract DOT-FA79WA-4335)
(AD-A109125; NAC/FR-303J/01; FAA-RD-81-109) Avail: NTIS HC A06/MF A01 CSCL 05/2

National Airspace Data Interchange Network (NADIN) architectural enhancements necessary to support the Remote Maintenance Monitoring System (RMMS) and MMS programs are described. Several alternative approaches are formulated. These alternatives are compared and recommendations are made. It is found that: The NADIN backbone has sufficient capacity to handle initial RMMS traffic at adequate performance levels; An X.25 compatible interface for the NADIN and MPS connection is recommended; Additional frame routing capabilities at the NADIN concentrator and front end processors are required; and Future MPS communications will be best served by a fully distributed packet switched NADIN capable of supporting complete X.25 functions. EFFECTS OF INSTALLATION OF F101 DFE EXHAUST NOZZLES ON THE AFTERBODY-NOZZLE CHARACTERISTICS OF THE F-14 AIRPLANE
David E. Reubush and John R. Carlson Mar. 1982 133 p refs
(NASA-TM-83250; L-14895) Avail: NTIS HC A07/MF A01 CSCL 01A

A wind-tunnel investigation was conducted to determine the effects of F101 DFE (derivative fighter engine) nozzle axial positioning on the afterbody-nozzle longitudinal aerodynamic characteristics of the F-14 airplane. The model was tested in the Langley 16-Foot Transonic Tunnel at Mach numbers from 0.7 to 1.25 and angles of attack from about -2 to 6 degrees. Compressed air was used to simulate nozzle exhaust flow at jet total-pressure ratios from 1 (jet off) to about 8. The results of the investigation show that for subsonic Mach numbers the intermediate cruise nozzle position of the three positions tested resulted in the lowest drag. Author

THE EFFECT OF A WELL ON THE AERODYNAMICS OF A SPOILER B.S. Thesis
N. A. Camm and J. J. Ovens Jun. 1981 82 p refs Original contains color illustrations
(BU-268) Avail: NTIS HC A05/MF A01

As an aid to spoiler design, the aerodynamics of a spoiler and its well were investigated. Particular attention was paid to gap and deployment angle. Three different shapes of spoiler and three types of well were tested. All tests were two dimensional, the spoiler being attached to a flat plate at zero incidence. A well was cut into the plate such that the spoiler was flush when not deployed. The Reynolds number was 62,000, based on fence chord. Flow visualization techniques and static pressure measurements were used both along the flat plate and around the spoiler to determine and understand the pressure distribution. Integration of the pressure results shows the normal force distribution. The application of the results to spoiler design is discussed through examples. Author (ESA)

REPORT OF THE AIR TRAFFIC FORECASTING WORKING PARTY, 1981
Sep. 1981 30 p ref.
Copyright. Avail: Issuing Activity

The U.K. forecasting model (improved by including relative tourist prices as a variable in leisure traffic equations and by refining business traffic specifications) is used to predict air traffic demand in the 1990's. London airports are treated separately. The effects of oil price rises, a channel tunnel, and hotel constraints in London are discussed. An increase of between 28 and 70 million passengers is predicted, i.e., a 2.5% to 5% annual growth rate. Growth rates for domestic traffic are lower than those projected for international traffic so that domestic traffic, which was 26% of the total in 1979, falls by 1995 to 23% on the low scenario and 20% on the high scenario. AN ASSESSMENT OF THE CRASH FIRE HAZARD OF LIQUID HYDROGEN FUELED AIRCRAFT Final Report
Feb. 1982 132 p refs
(Contract NAS3-22480)
(NASA-CR-165525; ADL-85181) Avail: NTIS HC A07/MF A01 CSCL 01C

The crash fire hazards of liquid hydrogen fueled aircraft relative to those of mission equivalent aircraft fueled either with conventional fuel or with liquefied methane were evaluated. The aircraft evaluated were based on Lockheed Corporation designs for 400 passenger, Mach 0.85, 5500 n. mile aircraft. Four crash scenarios were considered ranging from a minor incident causing some loss of fuel system integrity to a catastrophic crash. Major tasks included a review of hazardous properties of the alternate fuels and of historic crash fire data; a comparative hazard evaluation for each of the three fuels under four crash scenarios a comprehensive review and analysis and an identification of areas further development work. The conclusion was that the crash fire hazards are not significantly different when compared in general for the three fuels, although some fuels showed minor advantages in one respect or another. ANALYSIS OF A NONLINEAR ALTITUDE TRACKING METHOD Final Report, Sep. - Dec. 1980
Barry R. Billmann Nov. 1981 57 p refs
(FAA Proj. 052-242-320)
(AD-A108878; FAA-CT-81-18; FAA-RD-81-69) Avail: NTIS HC A04/MF A01 CSCL 01/2

This report analyzes the performance of the nonlinear altitude tracker developed for the Active Beacon Collision Avoidance System (BCAS) by Lincoln Laboratory. The tracker is intended for use in the collision avoidance logic of the BCAS system. The nonlinear tracker performance was characterized through comparisons with the previous altitude tracker. The original tracker, used by the collision avoidance logic, was a simplistic alpha-beta tracker. The nonlinear tracker performance evaluation was conducted in three phases: (1) The stand-alone error characteristics of the tracker were obtained. Simulated mode C report sequences were provided directly to the tracker. (2) The nonlinear tracker was integrated directly into the collision avoidance logic. With the use of the Fast-Time Encounter Generator (FTEG), a comparative study of performance with the nonlinear tracker versus the alpha-beta tracker was made. (3) Selected live flight test encounters were used to analyze the relative performance of the alpha-beta tracker versus the nonlinear tracker. The stand-alone analysis revealed that the nonlinear tracker consistently had smaller maximal errors in vertical rate estimation and a smaller transient rate response delay than did the alpha-beta tracker. Both the live flight test encounter simulations and the FTEG scenario simulation indicated that nonlinear tracking often caused an increase in separation for encounters with vertically accelerating threats and reduced occurrences of incorrect command sense choice. DISENGAGEMENT OF SAFETY HARNESS BUCKLES - CT4 Report, Aug. - Dec. 1979
S. R. Sarrailhe and G. A. Thomas Mar. 1981 25 p
(AD-A108048; ARL/STRUC-NOTE-466) Avail: NTIS HC A02/MF A01 CSCL 13/12

During the crash of a CT4 Airtrainer in August, 1979 both safety harness buckles disengaged. The crash was very severe but the harnesses did not show signs of overloading. After a series of tests it was concluded that the buckles disengaged because of misalignment of the loads onto the buckle. The misalignment may not be represented in the standard test procedures and they may give a false sense of security. The control angles. For comparisons mathematical models like the local momentum theory, and a fixed vortex model were applied. For these experiments a four bladed hingeless rotor and a two bladed See Saw rotor with an advance ratio of up to mu = 0.2 were used. Numerous tests were performed to study the flow field of rotor downwash in different wind tunnels. The measuring equipment for the downwash was set up on both sides of the rotor stand. So it was possible to receive two values at the same time. At first pneumatic probes were applied, that gave acceptable mean values, and then hot-wire probes in X-configuration were used to investigate downwash dynamics in more detail. Measurements were conducted in the x-z-plane. Wind tunnel test results, correlation to the mathematical models, and errors are discussed. J.M.S.

HOVER TESTS OF A MODEL H-FORCE ROTOR

H. R. Velkoff *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 19 p refs

(Contract NCA2-OR565-001)

Avail: NTIS HC A99/MF A01

The potential of using tip vanes at the ends of helicopter rotor blades to obtain a controllable H-force is considered. The addition of vanes placed perpendicular to the blade tips can be used to obtain an inplane force. By varying the angle of the vanes, a radial force can be created which can be controllable in azimuth position. Such a force could be used to provide translational motion of the rotor and aircraft without the requirement for rotor tilting. In addition, an H-force generated at high flight speed could be used as a propulsive force in a matter similar to a propeller. The force generated by the vanes could also affect the aircraft's stability characteristics. The H-force could also modify rotor performance in hovering since they could be thought to act as a virtual shroud. Tests were run with a model rotor which has a 6 foot diameter with a 3 inch chord blade. Test data are presented on the effects of various tip-vane configurations on the hovering figure of merit. The extreme sensitivity of the performance to vane arrangement is shown. Author

THE PROBLEM OF CALCULATION OF THE FLOW AROUND HELICOPTER ROTOR BLADE TIPS

H. Stahl *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 18 p refs

Avail: NTIS HC A99/MF A01

There are special problems with the theoretical analysis of the flow around helicopter rotor blade tips that are based on the fact that the flow is three dimensional, unsteady, rotational, and on the advancing blade in fast forward flight also transonic. Theories for this problem based upon potential flow theory are presented. Calculations show that this approach can lead to a sufficient discription of the actual flow. Computer programs for the three dimensional steady and the unsteady two dimensional flow past fixed wings were modified for rotating rotor blades. Results are shown. T.M.

APPLICATION OF THE ONER DYNAMIC STALL MODEL TO A HELICOPTER BLADE IN FORWARD FLIGHT

C. T. Tran and D. Falchero (SNIAS, Marignane, France) *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 26 p refs

Avail: NTIS HC A99/MF A01

The model was applied to the case of a helicopter rotor system in forward flight. Aspects of stability and periodic response are described and include: the form of the Floquet modes-subharmonic oscillation and almost periodic oscillation; the evolution of these modes as functions of the rotor advance ratio; the periodic response and aerodynamic force and moment; and a comparison with a quasi-steady aeroelastic calculation showing the effects of unsteady phenomena. T.M.

N82-18162# Royal Aircraft Establishment, Farnborough (England).

SOME UNSTEADY AERODYNAMIC EFFECTS ON HELICOPTER ROTORS

P. G. Wilby, M. J. Riley, and Judith Miller *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 14 p refs

Avail: NTIS HC A99/MF A01

Unsteady effects have an important influence on the aerodynamic loading experienced by a helicopter rotor in forward flight. These effects include dynamic stall characteristics with the associated stall delay and large nose-down change in pitching-moment. All unsteady effects must be taken into account when predicting rotor loads, performance and flight envelope. However, the full unsteady effects on the rotor result from simultaneous oscillatory variations of both incidence and Mach number, and it is difficult to study these effects in isolation from the rest of the rotor environment. Empirical methods for modelling these effects, especially dynamic stall characteristics, were developed and incorporated in the rotor loads prediction methods. Results from a program of work involving oscillatory aerofoil tests, flight experiments and unsteady aerodynamic prediction methods are presented. T.M.

SEPARATED FLOW AROUND HELICOPTER BODIES

G. Polz and J. Quentin *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 19 p refs

Avail: NTIS HC A99/MF A01

On the rear part of the helicopter fuselage, flow separation is often unavoidable owing to the shape of the afterbody which is often defined more in accordance with operational requirements (for example cargo door) and with only minor consideration to aerodynamic aspects. Because of the separated flow, an analytical calculation of the flow field using potential flow theory is not possible. After an overview about the separated flow phenomena a method is explained based on a combination of panel methods with boundary layer analysis. In this method the wake flow region is represented by a wake body which consists of a uniformly distributed vorticity. Calculated pressure distributions and flow fields are shown in comparison with wind tunnel test results. The main interest lies in the more downstream part of the wake, which is very important for the tail surface and tail rotor effectiveness. Author

A METHOD OF PREDICTING FUSELAGE LOADS IN HOVER

P. Taylor *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 13 p refs

Avail: NTIS HC A99/MF A01

A computer program called DOWNLOAD was developed in which the fuselage separated flow is modelled using a vortex sheet representation. The vortex sheet model can predict the separated flow pressure distribution provided the separation point is known. Unfortunately, the poor behavior of the vorticity vector in the separation region prevents an accurate prediction of the separation line. DOWNLOAD was applied to three simple fuselage shapes with a simple triangular representation of the rotor downwash. The predicted download values were in the lower region of the figures usually quoted as a percentage of thrust. T.M.

IMPACT OF SYSTEMS TECHNOLOGY AND INTEGRATION ON HELICOPTER DESIGN

K. Schymanietz *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 20 p refs

Avail: NTIS HC A99/MF A01

A helicopter design depends on a variety of parameters, criteria and requirements. A new design is generated either by a direct order of a customer or due to industrial investigations in the different fields like market trend studies, application of advanced or new technologies and/or overall efficiency improvements. A complete design includes not only the vehicle design with its main functional groups but also the integration of the systems/equipment concept. In the past a new helicopter design was conducted mainly due to the task for a new vehicle. The fact that - especially in the military field - the impact of systems gets an increasing influence in all design areas, gives an impression of the importance of systems technology and integration in the helicopter design. Future changes in design concepts are considered in terms of the chronological advance in the design of the different system components, new technologies for new systems, e.g., in the field of visionics, and system architecture based on a digital bus connection. T.M.

REVIEW OF HELICOPTER MAST MOUNTED SIGHT (MMS) BASE MOTION ISOLATION AND LINE-OF-SIGHT (LOS) STABILIZATION CONCEPTS

Daniel P. Schrage *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 16 p refs

Avail: NTIS HC A99/MF A01

Incorporation of a MMS or any precision stabilized pointing system on a helicoper is a complex and interesting dynamic design problem which combines automatic control through a servomechanism with vibration reduction techniques. Generally, the helicopter disturbance inputs to the MMS must be accomodated by a stiffer MMS structure and servo-system. However, weight and cost are usually critical and many benefits could be derived from incorporation of a lightweight vibration isolator. There are important design considerations on both sides of the interface, the airframe and the MMS. A review of these design considerations and several vibration isolation concepts is presented. The need for adequate simulation modeling of this complex dynamic environment is discussed. T.M.

MAST MOUNTED VISUAL AIDS

R. D. vonReth *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 24 p refs

Avail: NTIS HC A99/MF A01

Initial flight tests with a spherical mock up, having the same shape, weight and moments of inertia as the actual system were carried out on a Bo 105 with two different rotormast extensions (90 and 120 cm). A vibration survey over most of the Bo 105's flight envelope showed vibrational loads which can be tolerated by the actual system. As a next step the actual stabilized platform with FLIR, TV-camera and laser range finder was installed on the rotormast. In addition several subsystems used for the display of the video images with superimposed symbology are described. For direct comparison purposes three different systems, head up, head down and helmet mounted sight and display were evaluated. The influence of the rotorplane, vibrational loads and meteorological conditions on the performance of the FLIR image is described. T.M.

EXPERIMENTAL INVESTIGATION OF VISUAL AIDS FOR HELICOPTERS: LOW LEVEL FLIGHT AT NIGHT AND POOR VISIBILITY

R. Beyer, E. Dannebarg, E. Kohnen, and H. Stein *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 15 p refs

Avail: NTIS HC A99/MF A01

The potential and the limitations of advanced display systems for visual aids in helicopters were investigated. A combination of the sensor image and computer generated instrument displays in a head-down display, helmet mounted sight/display and night goggles, were evaluated. The layout of the instrument display is considered assuming transport mission and various display modes are implemented. The visual aids were flight tested in Bo 105 and Bell UH-1D helicopters with particular emphasis on the usefulness of the display modes on flight performance and low level flight performance. T.M.

THE MULTI MODE MATRIX FLAT PANEL DISPLAY: TECHNOLOGY AND APPLICATIONS

A. Moffat and P. Wright *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 19 p refs

Avail: NTIS HC A99/MF A01

An important aspect of current developments in advanced cockpit design is the introduction of a small number of interactive multi-function electronic displays with digital data processing, in conjunction with a MIL-STD-1553 type of multiplex data bus in an integrated system as opposed to the conventional approach of large numbers of stand-alone electro-mechanical instruments and a variety of different and independent dedicated inputs. Advances in high speed vector graphic display systems based on modular LED flat panel technology and micro-programmable multiprocessor data handling with MIL-STD-1553B compatible interfaces are described. Applications and systems performance are discussed in terms of typical military airborne mission-oriented display image formats and associated hardware and software characteristics. The real-time vector graphic presentations as described include flight control, navigation, communications, engine and fuel management, weapons management, symbolic map, signal communication and other types of real-time cockpit advisory information. T.M.

A REDUNDANCY CONCEPT FOR A DIGITAL CSAS

P. Wuest and M. Keller *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 12 p refs

Avail: NTIS HC A99/MF A01

One of the promises of digital technology is the possibility of implementing more intelligent monitoring techniques, for example, self monitoring methods. Typical redundancy and monitoring concepts, which were realized in aircraft, helicopter and engine control systems were reviewed. A system which was orginally not designed for a helicopter application but which shows all characteristics of a CSAS is described. The system is based on two essentially autonomous computing lanes, each able to provide all the necessary control and monitoring functions. T.M.

THE INFLUENCE OF SENSOR AND ACTUATOR CHARACTERISTICS ON OVERALL HELICOPTER AFCS DESIGN

S. G. Spreadborough *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 17 p

Avail: NTIS HC A99/MF A01

The overall performance of a flight control system is dependent on the characteristics of: sensors-type and performance; control low computing and logic; actuation-performance, configuration redundancy and authority. The specifications in each of these areas are considered in producing an integrated AFCS design which is compatible with the basic aircraft characteristics. The choice of sensors and the configuration and performance of the actuation, important decisions involving a high level of interdependence with the control law and system logic design, are discussed. T.M.

EVALUATION OF THE HELICOPTER LOW AIRSPEED SYSTEM LASSIE

J. Kaletka *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 23 p refs

Avail: NTIS HC A99/MF A01

To evaluate the airspeed sensing capability and the dynamic response characteristics of the system, both flight tests and wind tunnel tests were conducted. The system uses a swivelling pitot static probe designed to operate within rotor downwash in the low airspeed regime and out of downwash for higher speeds. Due to nonlinearities in the sensor transition phase an accurate system characterization is necessary to obtain reliable airspeed data. Flight tests that were conducted to characterize the system for a Bo 105 helicopter are described. The evaluation method and results, showing uncalibrated and calibrated data are discussed in detail. To investigate the dynamic behaviour of the system, dynamic tests in a wind tunnel equipped with a gust generating system were conducted. LASSIE transfer functions were measured for four different wind tunnel speeds. Representative results are shown and discussed. T.M.

OPTIMAL AIRCRAFT LANDING PATTERNS FOR MINIMAL NOISE IMPACT Ph.D. Thesis
Robert Chi-Tuan Chang 1981 183 p
Avail: Univ. Microfilms Order No. 8129300

A total system to perform the task of optimizing aircraft landing trajectories with respect to aircraft noise annoyance in the area near airports was developed. The noise annoyance considered was solely due to aircraft. Multiple aircraft on multiple landing paths were studied by the total system developed. While many of the subsystems such as the aircraft noise signature model, annoyance model, optimization methods, etc. already existed, the task was to combine all these together into a single working system. The various subsystems included an annoyance model (aircraft noise signature model, population model, impact intensity weighting function), formulation of aircraft landing paths and constraints, performance measure, and optimization. A single numerical number, noise impact index, which represents the average severity of noise impact over the entire population of a community was adopted as the annoyance index. Dissert. Abstr.

ACTIVE BEACON COLLISION AVOIDANCE SYSTEM (BCAS) LOGIC PERFORMANCE DURING OPERATIONAL FLIGHT TESTS Report, 13 Jul. - 9 Sep. 1980
R. A. Tornese and A. L. McFarland Washington FAA Jan. 1981 123 p refs
(Contract DTFA01-81-C-10001)
(AD-A108893; MTR-80/W352; FAA-RD-80-138) Avail: NTIS HC A06/MF A01 CSCL 17/7

Between 13 July and 9 September 1980, operational flight tests of an Active BCAS Experimental Unit (BEU) were conducted. The flight tests included 129 approaches to 28 different airports during 60 hours of flight: 14 unplanned encounters which gave rise to BCAS alerts were recorded. In each of the encounters, the aircraft carrying the BEU came into a conflict with another aircraft entirely by chance. The other aircraft was not associated with the BCAS test program in any way. The primary purpose of the flight tests was to determine how many unplanned alerts would occur during normal flight operations and to assess whether each was a desirable or unwanted alert. In addition, alert correctness, timeliness, and utility were considered along with the potential impact of BCAS on the ATC system. The data was also used to determine approximately the region(s) where desensitization of BCAS threat logic should be applied to limit unwanted alerts. GRA

VEHICLE TEST REPORT: BATTRONIC PICKUP TRUCK
Theodore W. Price, Thomas W. Shain, Raymond J. Freeman, and Michael F. Pompa 1 Jan. 1982 47 p refs
(Contracts NAS7-100; DE-AI01-78CS-54209)
(NASA-CR-168637; JPL-Pub-82-8; DOE/CS-54209/6) Avail: NTIS HC A03/MF A01 CSCL 13F

An electric pickup truck was tested to characterize certain parameters and to provide baseline data that can be used for the comparison of improved batteries that may be incorporated into the vehicle at a later time. The vehicle tests were concentrated on the electrical drive subsystem; i.e., the batteries, controller, and motor. The tests included coastdowns to characterize the road load and range evaluations for both cyclic and constant speed conditions. A qualitative evaluation of the vehicle's performance was made by comparing its constant speed range performance with other vehicles. S.L.

DESCENT-RATE CUING FOR CARRIER LANDINGS: EFFECTS OF DISPLAY GAIN, DISPLAY NOISE AND AIRCRAFT TYPE Interim Report, 1 May 1980 - 30 Nov. 1981
Gaven Lintern, Daniel J. Sheppard, and Charles E. Kaul Oct. 1981 42 p refs
(Contract N61339-78-C-0060)
(AD-A108801; TR-81-015; NAVTRAEQUIPCEN-78-C-0060-8) Avail: NTIS HC A03/MF A01 CSCL 01/2

Two studies are reported concerning the utility of modifying a conventional Fresnel Lens Optical Landing System (FLOLS) to include variable-length vertical light arrays, or arrows, in order to provide descent-rate information to pilots making carrier landings. In the first study, the Descent-Rate Cuing (DRC) algorithm incorporated an angular gain to provide glideslope displacement information. The DRC system did not significantly improve glideslope tracking performance. Lineup performance was not adversely affected. The effects of aircraft type and noise on the DRC were also examined. In the second study, the DRC algorithm incorporated a modified linear gain to provide glideslope displacement information. The DRC system consistently reduced glideslope error throughout the approach. Comparison of the data and previous research suggests that a DRC system incorporating a linear gain can produce a strong and consistent improvement in glideslope control in carrier landings. TRANSPORT AIRCRAFT COCKPIT STANDARDIZATION (FEDERAL AVIATION REGULATIONS PART 25) Final Report
Richard Sulzer Nov. 1981 42 p
(FAA Proj. 161-200-130)
(AD-A108924; FAA-CT-80-54; FAA-EM-81-11) Avail: NTIS HC A03/MF A01 CSCL 01/3

The present status of transport aircraft cockpit standardization was evaluated by examination of regulations and other design practice documents and by interviews with airline pilots and engineers. Flight critical areas most in need of increased standardization were identified as (1) primary flight guidance instrumentation and (2) pilot input keyboards. Additional areas proposed for further industry consultation, possibly leading to further standardization at a future date, include flap, slat, and leading-edge device control and display systems; indicated airspeed (IAS)-Mach indicators; powerplant instrumentation; and electric and hydraulic power diagrams, displays, and controls. The continued use of a mixed metric and English unit measurement plan in both United States and foreign manufactured aircraft is noted, and the incidence of pilot dual qualifications and the need for criteria for digital system software certification are also discussed. HELICOPTER ICING SPRAY SYSTEM (HISS) NOZZLE IMPROVEMENT EVALUATION Final Report
Daumants Belte Sep. 1981 53 p refs
(AD-A108405; USAAEFA-79-02-2) Avail: NTIS HC A04/MF A01 CSCL 01/2

The U.S. Army Aviation Engineering Flight Activity (USAAEFA) operates a modified CH-47C helicopter as an airborne spray tanker to create a simulated icing test environment. This system was modified to improve its spray cloud characteristics with respect to uniformity of liquid water content (LWC) and reduction of drop size median volumetric diameter (MVD). The existing atomizers on the spray boom assembly were replaced by Sonic Development Corporation model 125-H 'Sonicore' nozzles. A UH-1H helicopter equipped with particle measuring spectrometers conducted in-flight sampling and calibration of a modified HISS spray cloud in conjunction with other helicopter icing tests. Average cross sectional dimensions of the present spray cloud was estimated as 36 ft wide and 8 ft deep. Usable values of cloud LWC in excess of 1 gram per cubic meter with a drop size MVD range of 20 to 35 microns can be generated at a 90 knot airspeed. GRA

DEVELOPMENT OF MANUFACTURING TECHNOLOGY FOR FABRICATION OF A COMPOSITE HELICOPTER MAIN ROTOR SPAR BY TUBULAR BRAIDING Final Report, Sep. 1978 - Sep. 1980
Mark L. White St. Louis, Mo. Army Aviation Research and Development Command Apr. 1981 81 p refs
(Contract DAAG46-78-C-0070)
(AD-A109377; R-1618; AVRADCOM-TR-81-F-8) Avail: NTIS HC A05/MF A01 CSCL 11/4

Mechanical tubular braiding has been shown to be a viable blade spar manufacturing process in a program which included preliminary design of an improved main rotor blade for the OH-58 helicopter. The blade incorporates an advanced aerodynamic shape and has as its primary structural member a Kevlar 49/epoxy spar fabricated by braiding. Achievement of an analytically acceptable blade and spar design meeting critical structural and dynamic requirements was not hindered by braiding process constraints. Mechanical property tests of flat panels and spar sections exhibited excellent correlation with analytical predictions, substantiating the applicability of normal composite laminate analysis methods and the validity of the specific design. Ballistic testing of spar sections demonstrated superior containment of structural damage compared to composite spars produced by more conventional methods. Manufacturing cost estimates predict a price reduction of 1/3 for the braided spar relative to a similar S-glass/epoxy spar for an OH-58 blade of identical external shape fabricated by orthodox, low-cost technology. A METHOD FOR APPLYING LINEAR OPTIMAL CONTROL THEORY TO THE DESIGN OF A REGULATOR FOR A FLEXIBLE AIRCRAFT
L. J. J. Erkelens and J. L. [illegible] 31 Mar. 1980 69 p refs Previously announced as NLR-TR-79119-C Sponsored by Directorate of Materiel Air RNLAF
(NLR-TR-80032-U; NLR-TR-79119-C) Avail: NTIS HC A05/MF A01

A hypothetical control system that provides improved rigid body and structural mode damping of a flexible aircraft in order to improve the riding quality and minimize the wing bending moment during flight in turbulence is considered. The equations of motion are related to a high performance fighter aircraft with external stores. The feedback gains are determined, using linear optimal control theory. A quadratic optimization criterion, taking into account the normal acceleration at the pilot seat and the wing root bending moment, is used. A number of optimal and suboptimal regulators are calculated. The system performance is expressed in terms of pole location, frequency response, and power spectra for both pilot seat acceleration and wing root bending moment. Aircraft response to a deterministic gust disturbance is presented. Author (ESA)

ON THE DESIGN OF SOME AIRFOILS FOR SAILPLANE APPLICATION
L. M. M. Boermans and H. J. W. Selen Apr. 1981 47 p refs Presented at 17th OSTIV Congr., Paderborn, West Germany, 1981
(VTH-LR-326) Avail: NTIS HC A03/MF A01

Airfoils were designed such that, by adding material to the surface, an existing wing could be modified and tested in flight. Wind tunnel experiments on inner and outer wing segments are described, giving information on the quality of actual airfoils achieved in serial production and of the LSL airfoil analysis and design computer program. The characteristics of several modern airfoils used in standard class sailplanes are analyzed and typical differences in the case of smooth surface and of rough leading edge are clarified. Wind tunnel measurements with real insect remains on a wing segment are compared with a well known simulated bug pattern and shown to have greatly different drag characteristics. The application of pneumatic turbulators to reduce the drag of an airfoil is discussed. The computer program was used to modify the wing of an ASW-19B sailplane. Flight tests are satisfactory. Author (ESA)

A FURTHER STUDY OF HELICOPTER ROTOR PITCH-FLAP-PHASE COUPLING B.S. Thesis
A. East and N. S. Sahni Jun. 1981 81 p refs
(BU-258) Avail: NTIS HC A05/MF A01

Pitch-flap phase coupling between the blades of a helicopter rotor was studied in order to improve overall aircraft stability. A mathematical model was constructed for the Westland Lynx helicopter, which incorporates a semiarticulated rotor head. Full expressions are derived in a lengthy, but accurate fashion for the blade flapping motion as well as for rotor hub forces and moments. The rotor state defined is believed to be more accurate than that of any previous, known treatment. Pitch-flap phase coupling of the form: blade pitch angle at rotor center line = blade pitch control angle + pitch-flap coupling gain (blade flap angle + pitch-flap-phase coupling lead/lag), is introduced. The effect on the rotor derivatives is given with change in phase lead/lag angle and control gain. A full six degrees of freedom model is extensively used for the study of stability, with the results beset with problems which are discussed. Author (ESA)

(BU-262) Avail: NTIS HC A04/MF A01

The feasibility of a six seat variant of the [illegible] twin-engined aircraft, the Marshal, was studied. Results show that the Marshal, powered by two 200 h.p. engines and of an all-up-weight (AUW) of 3550 lb, can compete in the open market both in terms of performance and price. No major structural alterations, except on the fuselage to accommodate two additional passengers, are envisaged. This aircraft is expected to be suitable

Volkmar Held *In* DGLR Seventh European Rotorcraft and Powered Lift Aircraft Forum 1981 17 p
Avail: NTIS HC A99/MF AU1

The demand for saving weight, volume and especially cost requires new design concepts for avionic systems. In future, highly integrated systems will replace the conventional systems with specific stand-alone equipment for each system function. A concept for the integration of inertial function flight control, sight-stabilization, navigation of a helicopter is presented. A configuration with a minimum number of dislocated inertial sensors is proposed. The system functions are accomplished on system level by integration and multiple use of the sensor signals. It is shown that the navigation functions, attitude and heading can be derived from the flight control and stabilization hardware so that the usually required separate attitude and heading reference system for the navigation is saved. Moreover, the proposed concept provides as an additional function the autonomous initial alignment to north. T.M.

AN ANALYTICAL INVESTIGATION OF THE FREE-TIP ROTOR FOR HELICOPTERS
Robert H. Stroub Feb. 1982 30 p refs
(NASA-TM-81345; A-8806) Avail: NTIS HC A03/MF A01 CSCL 01A

A rotor configuration called the free-tip rotor was analytically investigated for its potential to improve helicopter forward-flight performance characteristics. This rotor differs from a conventional rotor only in the blade tip region. In this configuration, the tip is self-adjusting in pitch with respect to the rest of the blade, in accordance with a moment balance about its pitch axis. With this self-adjusting capability, the resulting pitch motion generates a more uniform airload distribution around the azimuth. Computer math models were used to compare performance characteristics of the free tip rotor with those of a conventional rotor operation at flight speeds from 130 to 160 knots. The results of this analysis indicate that the free-tip rotor improves cruise lift-drag ratio by at least 22%. Author

N82-18183*# National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
SPIN-TUNNEL INVESTIGATION OF A 1/13-SCALE MODEL OF THE NASA AD-1 OBLIQUE-WING RESEARCH AIRCRAFT
William L. White and James S. Bowman, Jr. Feb. 1982 28 p ref
(NASA-TM-83236; L-14834) Avail: NTIS HC A03/MF A01 CSCL 01A

The spin and recovery characteristics of a 1/13-scale model of the NASA AD-1 oblique-wing research aircraft at wing-skew positions of 0, 25, 45, and 60 deg (right wing forward) were investigated. Spins were obtained for all wing-skew positions tested. For the unskewed wing position, two spin modes were possible. One spin mode was very steep and recoveries were obtained within 1 turn or less by rudder reversal. The second spin mode was flat and fast; the angle of attack was about 75 deg and the spin rate was about 145 deg/sec (2.5 seconds per turn). For the skewed wing positions, spins were obtained only in the direction of the forward-skewed wing (right wing forward). No spins were obtained to the left when the wing was skewed with the right wing forward. Recoveries should be attempted by deflecting the rudder to full against the spin, the ailerons to full with the spin, and movement of the wings to 0 deg skew. If the wing is skewed, the recovery may not be effected until the wing skew approaches 0 deg. B.W.

ON THE CALCULATION OF TRANSONIC BLADE TIP FLOW FOR HELICOPTER ROTORS [ZUR BERECHNUNG DER TRANSSONISCHEN BLATTSPITZENUMSTROEMUNG BEI HUBSCHRAUBERROTOREN]
H. Stahl and V. Mikulla 8 May 1981 27 p refs In GERMAN Presented at DGLR Jahrestagung 1981, Aachen, 12-14 May 1981
(MBB-UD-320-81-O; DGLR-81-025) Avail: NTIS HC A03/MF A01

Blade element theory (two dimensional) based on the rotor calculation program, its radials and its chronological relationship was demonstrated. Blade tip flow is three dimensional and interstationary and the forward moving blade in a fast forward flight becomes transonic. Theories, based on potential theory are proposed, though these do not perform on rotary wings. This method demonstrates the real flow rate. A three dimensional calculation of the aerodynamic characteristics of the fixed wings, was utilized, to show that by introducing a Mach number per gradient along the rotor radius, rotor calculation can be modified. INVESTIGATIONS OF THE SEPARATION BEHAVIOR ON AIRFOILS AT HIGH ANGLES OF ATTACK, USING LINEAR LIFT THEORY Thesis - Hochschule der Bundeswehr, Munich [UNTERSUCHUNGEN ZUM ABREISSVERHALTEN VON TRAGFLUEGELN IM HOHEN ANSTELLWINKELBEREICH MIT HILFE DER TRAGLINIENTHEORIE]
Karl-Heinz Haerdtl 1 Nov. 1980 157 p refs In GERMAN
(MBB-FE-122/S/PUB/37; Rept-80/7) Avail: NTIS HC A08/MF A01

Different methods for calculating the lift coefficient of an airfoil wing were examined. The calculation of aerodynamic characteristics of airplanes is of great importance. Complex three dimensional boundary layers, especially for swept back wings with leading edge slats and trailing edges with split flaps which very much effect airfoil flows. Two different methods to calculate three dimensional boundary layers are presented.

LAMINAR AIRFOILS FOR TRANSPORT AIRCRAFT
Armin Quast Oct. 1981 33 p refs Transl. into ENGLISH of "Laminarprofile fuer verkehrsflugzeuge" Rept. DFVLR-Mitt-80-07 DFVLR, Brunswick, Mar. 1980 33 p
(ESA-TT-680; DFVLR-Mitt-80-07) Avail: NTIS HC A03/MF A01; DFVLR, Cologne DM 8,30

The development of laminar airfoils in order to save fuel by reducing drag is discussed. Laminarization through shaping is considered. Laminar and turbulent boundary layer theory and subjective assessment indicate that laminar airfoils for high Reynolds numbers are feasible, with a 22% fuel saving. The reduced cruising speeds, required, however, decrease passenger comfort, making them more suitable for freight carrying.

Wind tunnel data for the ACES-B1 ejection seat in the presence of the B-1 forebody are documented and analyzed. Significant aerodynamic interactions exist at high speed between dual seats and between seat/forebody. Trajectory data are presented with and without the forebody effect upon the seat. The forebody flow field is shown to increase the human engineering/biomechanical problems during high-speed ejection.

The next generation combat aircraft with advanced aerodynamic and control features will have combat maneuver capability which will impose multiaxial accelerations on the aircrew. Advanced aircrew systems will be required for restraint, support, and mobility during these combat conditions. New concepts for these systems have been defined, but tests under representative dynamic conditions are necessary to evaluate the effectiveness of these concepts when implemented. Author (GRA)

(AD-A108688; NADC-81215-60) Avail: NTIS HC A02/MF A01 CSCL 01/3

This program was conducted to evaluate solutions to deficiencies of the F18 Aircraft Martin-Baker SJU-5/A escape system which had been identified during the initial Physiological Acceptability Demonstration (Report No. NADC-79040-60). The proposed solutions evaluated during this program included: incorporation of 'toe guides' on the rudder pedals, relocation of the head rest, modification of the back support, and incorporation of leg garters into the anti-'G' suit. Of these, the head rest and back support still require additional modification. Upon satisfactory correction of the head rest and back support deficiencies, physiological acceptance of the F18 escape system will be recommended for the pilot's station. Author (GRA)

DISTRIBUTED INTELLIGENCE FOR AIR FLEET CONTROL Interim Report
Randall Steeb, Stephanie Cammarata, Frederick A. Hayes-Roth, Perry W. Thorndyke, and Robert E. Wesson Jun. 1981 59 p refs
(Contract MDA903-78-C-0029; ARPA Order 3640)
(AD-A108611; RAND/R-2728-ARPA; LC-81-13913; ISBN-0-8330-0353-4) Avail: NTIS HC A04/MF A01 CSCL 17/7

Distributed planning and control techniques provide potential advantages over centralized processing in speed, cost, reliability, flexibility, and minimization of long-distance communications for a variety of tasks, including military threat assessment, command and control decisionmaking, disaster relief coordination, and civilian air traffic control. Six different architectures for distribution of control among multiple processors are presented, and the influences of different task environments on each are discussed. The work focuses primarily on the use of distributed planning and control for civilian air traffic control. One architecture, in which each aircraft is controlled by a separate processor, is described in detail in an illustrative scenario. An initial system design is presented in which cooperating 'experts' comprise a processor. These cooperating experts sense or infer aircraft intentions, generate and evaluate plans, control and monitor plan execution, and communicate with other processors. Author (GRA)

IMPROVEMENTS AND EXTENSIONS OF THE GEOMETRICAL DILUTION OF PRECISION (GDOP) CONCEPT FOR SELECTING NAVIGATION MEASUREMENTS Final Report, 1 May 1980 - 1 May 1981
William L. Brogan Wright-Patterson AFB, Ohio AFWAL Sep. 1981 69 p refs
(Contract F33615-80-C-1092; AF Proj. 6095)
(AD-A108607; AFWAL-TR-81-1142) Avail: NTIS HC A04/MF A01 CSCL 17/7

The optimal measurement selection problem was studied for the Global Positioning Satellite system (GPS). The fundamentals of the Geometrical Dilution of Precision (GDOP) concept were briefly reviewed, because GDOP is frequently used to rank the effectiveness of potential measurements. It is shown that GDOP does not always select the best measurements in the sense of minimum mean square navigation error. For this reason weighted least-squares and minimum variance (Kalman filter) methods were used to derive several improved measurement ranking schemes. Nonuniform measurement noise and a prior knowledge about the state are taken into account. Any specified weighted combination of the component error variances can be minimized. Eigenvalue-eigenvector theory was used to derive useful bounds and to provide geometrical insight. A purely algorithmic approach is also presented and applied to a number of representative GPS cases. A POSSIBLE WAY OF SPECIFICALLY CORRECTING LOCATION AND NAVIGATIONAL ERRORS CAUSED BY REFLECTION AND OTHER PROPAGATION ANOMALIES
Fritz Stelzel Jul. 1981 125 p refs Transl. into ENGLISH of "Uber eine Moeglichkeit zur gezielten Korrektur von Ortungs- u. Navigationsfehlern, die durch Reflexionen u. sonstige Ausbreitungsanomalien verursacht werden", Rept. DFVLR-Mitt-79-17 DFVLR, Oberpfaffenhofen, West Germany, May 1979
(ESA-TT-667; DFVLR-Mitt-79-17) Avail: NTIS HC A06/MF A01; DFVLR, Cologne DM 21,20

Electromagnetic wave propagation in urban areas is discussed in relation to vehicle location. Current methods are reviewed for vehicles on a arbitrary route. Isophase and hyperbola systems are compared. The isophase system is more accurate. A correction procedure for multipath induced errors is presented, based on measuring time signals from four transmitters. The use of measured times in order to reduce location errors caused by propagation anomalies is described. The methods were tested on a simulated city area covered by transmitters on the corners of a 25 km square. Results are inconclusive. Author (ESA)

DESIGN STUDY INTO A HIGH ENDURANCE MINI-ROTORCRAFT B.S. Thesis
D. A. E. Beedell and J. C. Handy Jun. 1981 71 p refs
Original contains color illustrations
(BU-265) Avail: NTIS HC A04/MF A01

Competing models in a minirotorcraft competition for maximum endurance with an all up weight no greater than 5 kg, must fly above a height of 5 m within an area 10 m square are discussed. A design in which aerodynamics, stability and control, and mechanical and structural aspects are considered to obtain the size and angular velocity of the rotor for minimum power, while sufficient stability and control for a long flight are still inherent in the overall system is presented. Weights of individual components are also examined. It is found that a rotor mounted engine configuration, with rotor radius about 1.6 m and rotational velocity 4 to 5 revs/sec, with engines half way along the rotors and with Hiller control rotors, is the most promising design. The possible endurance is some 12 hr and hence pilot error and mechanical failure become deciding factors. Author (ESA)

A CONCEPT FOR A FUEL EFFICIENT FLIGHT PLANNING AID FOR GENERAL AVIATION Final Report
B. P. Collins, A. L. Haines, and C. J. Wales Washington NASA Mar. 1982 96 p refs
(Contract NAS1-16430)
(NASA-CR-3533; MTR-81W233) Avail: NTIS HC A05/MF A01 CSCL 01D

A core equation for estimation of fuel burn from path profile data was developed. This equation was used as a necessary ingredient in a dynamic program to define a fuel efficient flight path. The resultant algorithm is oriented toward use by general aviation. The pilot provides a description of the desired ground track, standard aircraft parameters, and weather at selected waypoints. The algorithm then derives the fuel efficient altitudes and velocities at the waypoints. B.W.

ASSESSMENT OF AVIONIC EQUIPMENT FIELD RELIABILITY AND MAINTAINABILITY AS FUNCTIONS OF UNIT COST
Mark I. Knapp and Joseph W. Stahl 7 Oct. 1981 24 p refs
Presented at the 16th Ann. Dept. of Defense Cost Analysis Symp., Arlington, Va., 4-7 Oct. 1981
(AD-A109373) Avail: NTIS HC A02/MF A01 CSCL 01/3

Pound-for-pound, avionics is generally recognized as the most expensive, complex and sophisticated part of an aircraft. Reliability and maintainability are critical characteristics that influence spares provisioning, maintenance resource requirements, system operational availability and, ultimately, investment and operating costs. Consequently, much attention has been focused upon improving the reliability and maintainability of avionics which, in the past, have been disappointingly low. This paper addresses avionics reliability and maintainability. The analysis was performed last year in partial response to a request of IDA by OASD (C(3)I) to provide information for use by DSARC principals at the Full-Scale Development milestone. Since the 5000 series of DoD Directives and Instructions emphasize analytical comparisons of any new systems under consideration by the DSARC with current, comparable systems, we undertook analyses to determine if there may be one or more historical relationships between field reliability and maintainability and avionic equipment characteristics that would assist in forecasting those attributes. GRA

EQUIPMENT FOR TESTING AND MEASURING A 'HELMET MOUNTED SIGHT AND DISPLAY' SYSTEM WITH A COUPLED MOVABLE TV CAMERA IN THE FLIGHT SIMULATOR FOR RESEARCH OF THE DFVLR
Friedrich Erdmann, R. Dierke, E. Biertuempel, R. Ehlers, and H. Loehr Nov. 1981 70 p refs Transl. into ENGLISH of "Ein Versuchsaufbau zum Ausmessen eines 'Helmet Mounted Sight/Display' mit Nachgeschaltetem Kameraschwenkrahmen im Forschungsflugsimulator der DFVLR" Rept. DFVLR-Mitt-80-04 DFVLR, Brunswick, Jan. 1980 Original report in GERMAN previously announced as ESA-86301
(ESA-TT-675; DFVLR-Mitt-80-04) Avail: NTIS HC A04/MF A01; DFVLR, Cologne DM 17,40

A test installation capable of static and dynamic measurements on a helmet mounted sight and display (HMS/D) during simulated helicopter motion, by means of a steerable camera rotation framework was built. The rotation frame is gyro controlled and moves about two axes (in pitch and yaw). The HMS/D generates the helmet line of sight referred to the simulator platform (the aircraft based system) in terms of azimuth and elevation. Through the helmet mounted display, using a semitransparent mirror, an electronically produced cross hair (the helmet mounted sight) is superimposed on the image in the right eye of the pilot. The TV picture is also reflected into his eye, enabling him to aim at a target on the sensor image. Test equipment accuracy is 40 min in azimuth, 20 min in elevation. Author (ESA)

DILUTION JET BEHAVIOR IN THE TURN SECTION OF A REVERSE FLOW COMBUSTER
Steven M. Riddlebaugh, Abraham Lipshitz (Ahuza, Haifa, Israel), and Issac Greber (Case Western Reserve Univ., Cleveland, Ohio) Jan. 1982 15 p refs Presented at the 20th Aerospace Sci. Meeting, Orlando, Fla., 10-14 Jan. 1982; sponsored by AIAA
(NASA-TM-82776; E-1107; AIAA-82-0192) Avail: NTIS HC A02/MF A01 CSCL 21E

Measurements of the temperature field produced by a single jet and a row of dilution jets issued into a reverse flow combustor are presented. The temperature measurements are presented in the form of consecutive normalized temperature profiles, and jet trajectories. Single jet trajectories were swept toward the inner wall of the turn, whether injection was from the inner or outer wall. This behavior is explained by the radially inward velocity component necessary to support irrotational flow through the turn. Comparison between experimental results and model calculations showed poor agreement due to the model's not including the radial velocity component. A widely spaced row of jets produced trajectories similar to single jets at similar test conditions, but as spacing ratio was reduced, penetration was reduced to the point where the dilution jet flow attached to the wall. Author

COOLED VARIABLE-AREA RADIAL TURBINE TECHNOLOGY PROGRAM Final Report
G. D. Large and L. J. Meyer Jan. 1982 303 p refs
(Contract NAS3-22004)
(NASA-CR-165408) Avail: NTIS HC A14/MF A01 CSCL 21E

The objective of this study was a conceptual evaluation and design analyses of a cooled variable-area radial turbine capable of maintaining nearly constant high efficiency when operated at a constant speed and pressure ratio over a range of flows corresponding to 50- to 100-percent maximum engine power. The results showed that a 1589K (2400 F) turbine was feasible that would satisfy a 4000-hour duty cycle life goal. The final design feasibility is based on 1988 material technology goals. A peak aerodynamic stage total efficiency of 0.88 was predicted at 100 percent power. Two candidate stators were identified: an articulated trailing-edge and a locally movable sidewall. Both concepts must be experimentally evaluated to determine the optimum configuration. A follow-on test program is proposed for this evaluation. Author

PERFORMANCE OF SINGLE-STAGE AXIAL-FLOW TRANSONIC COMPRESSOR WITH ROTOR AND STATOR ASPECT RATIOS OF 1.63 AND 1.78, RESPECTIVELY, AND WITH DESIGN PRESSURE RATIO OF 1.82
Royce D. Moore and Lonnie Reid Feb. 1982 112 p refs
(NASA-TP-1974; E-259) Avail: NTIS HC A06/MF A01 CSCL 21E

The overall and blade-element performance of a transonic compressor stage is presented over the stable operating flow range for speeds from 50 to 100 percent of design. The stage was designed for a pressure ratio of 1.82 at a flow 20.2 kg/sec and a tip speed of 455 m/sec. At design speed the stage achieved a peak efficiency of 0.821 at a pressure ratio of 1.817. The stage stall margin at design speed based on conditions at stall and peak efficiency was about 11 percent. Author

A CRITERION FOR THE PREDICTION OF THE RECOVERY CHARACTERISTICS OF SPINNING AIRCRAFT
T. H. Kerr 1981 24 p refs
(RAE-TN-AERO-2251) Copyright. Avail: Issuing Activity

Full scale spinning tests were analyzed in order to produce a recovery estimation method for straight and swept wing aircraft. The rate of rotation about spin axis X wing span/true rate of descent in ft/sec, was estimated from the general layout and loading of the aircraft. Antispin rolling moment coefficient (wind axis) due to the body at a mean incidence of 45 deg and antispin moment due to the movement of the rudder from neutral to fully antispin were calculated. The unbalanced (antispin) rolling moment coefficient is derived. This is plotted against (I- (pitching moment of inertia/rolling moment of inertia)) and whether the aircraft is likely to have a satisfactory spin recovery characteristic is assessed by reference to the empirical boundary tables provided. Data for Spitfire and Hurricane aircraft are provided. Recovery standards improve as pitching moment of inertia/rolling moment of inertia increases. Author (ESA)

AN EXPERIMENTAL STUDY OF THE EFFECT OF TAIL CONFIGURATION ON THE SPINNING CHARACTERISTICS OF GENERAL AVIATION AIRCRAFT M.S. Thesis
Mark G. Ballin Mar. 1982 182 p refs
(Grant NAG1-73)
(NASA-CR-168578) Avail: NTIS HC A09/MF A01 CSCL 01C

The feasibility of using static wind tunnel tests to obtain information about spin damping characteristics of an isolated general aviation aircraft tail was investigated. A representative tail section was oriented to the tunnel free streamline at angles simulating an equilibrium spin. A full range of normally encountered spin conditions was employed. Results of parametric studies performed to determine the effect of spin damping on several tail design parameters show satisfactory agreement with NASA rotary balance tests. Wing and body interference effects are present in the NASA studies at steep spin attitudes, but agreement improves with increasing pitch angle and spin rate, suggesting that rotational flow effects are minimal. Vertical position of the horizontal stabilizer is found to be a primary parameter affecting yaw damping, and horizontal tail chordwise position induces a substantial effect on pitching moment. SIMULATOR STUDY OF VORTEX ENCOUNTERS BY A TWIN-ENGINE, COMMERCIAL, JET TRANSPORT AIRPLANE
Earl C. Hastings, Jr. and Gerald L. Keyser, Jr. Feb. 1982 65 p refs
(NASA-TP-1966; L-14187) Avail: NTIS HC A04/MF A01 CSCL 01C

A simulator study of vortex encounters was conducted for a twin-engine, commercial, jet transport airplane encountering the vortex flow field of a heavy, four-engine, commercial, jet transport airplane in the final-approach configuration. The encounters were conducted with fixed controls and with a pilot using a state-of-the-art, manual-control system. Piloted encounters with the base-line vortex flow field out of ground effect (unattenuated) resulted in initial bank-angle excursions greater than 40 deg, coupled with initial sideslip-angle excursions greater than 10 deg. The severity of these initial upsets was significantly reduced when the vortex center was moved laterally or vertically away from the flight path of the encountering airplane. Smaller reductions occurred when the flow field was attenuated by the flight spoilers on the generating airplane. The largest reduction in the severity of the initial upsets, however, was from aging in ground effect. The severity of the initial upsets of the following airplane was relatively unaffected by the approach speed. Increasing the lift coefficient of the generating airplane resulted in an increase in the severity of the initial upsets. Author

FLUTTER AND TIME RESPONSE ANALYSES OF THREE DEGREE OF FREEDOM AIRFOILS IN TRANSONIC FLOW Final Report, Nov. 1979 - Dec. 1980
T. Y. Yang and C. H. Chen Wright-Patterson AFB, Ohio AFWAL Aug. 1981 60 p refs
(Grant AF-AFOSR-3523-78; AF Proj. 2307)
(AD-A108867; AFWAL-TR-81-3103) Avail: NTIS HC A04/MF A01 CSCL 20/4

Flutter and time response analyses are performed for a NACA 64A006 conventional and a MBB A-3 supercritical airfoil, both oscillating with plunge, pitch, and aileron pitch d.o.f.'s in small disturbance, transonic flow. The aerodynamic coefficients are calculated using the transonic code LTRAN2-NLR. The effects of various kinds of aeroelastic parameters on flutter speeds for the bending-torsion, bending-aileron, and torsion-aileron branches are studied. The flutter speeds associated with the bending-torsion branch are plotted against Mach number for different parameter values. The flutter speed, the amplitude ratio, and the phase difference at different Mach numbers are plotted against the mass ratio for both of two d.o.f. and a three d.o.f. case. Time-response results are obtained for the NACA 64A006 and the MBB A-3 airfoils at M = 0.85 and 0.765, respectively. Using the same sets of parameter values, the flight speeds used to obtain all the neutrally stable response are very close to the flutter speeds obtained in the flutter analysis. The principle of linear superposition of airloads is used in the flutter analysis but not in the response analysis. Author (GRA)

THE PRESSURE SIGNATURE METHOD FOR BLOCKAGE CORRECTIONS, AND ITS APPLICATIONS TO THE INDUSTRIAL WIND TUNNEL B.S. Thesis
A. S. Walker and N. P. Wiseman Jun. 1981 43 p refs
([illegible]) Avail: NTIS HC A03/MF A01

secondary radar systems on the ground, and independent electronic systems onboard are discussed. For two and three dimensional stationary turns, basic geometrical and physical aspects of conflict detection are derived and details are given on the apparent size and motion of the other aircraft on the windshield. For conflict warning by means of ground based or onboard electronic systems, a linear track model is used. The predicted minimum distance at the closest approach, the lead times to this event or to the penetration of a zone of protection around the intruder, and the zeta parameter are analyzed as potential conflict criteria. Similarity rules and the separation of three dimensional conflicts into horizontal and vertical problems are treated. Commercial pilots lack special training in optically based risk assessment. Autonomous onboard warning systems do not make the see and avoid concept obsolete. Author (ESA)

(Contract NAS2-10078)
(NASA-CR-166138; ACEE-16-FR-0016) Avail: NTIS HC A14/MF A01 CSCL 01C

The feasibility of the propfan relative to the turbofan is summarized, using the Douglas DC-9 Super 80 (DS-8000) as the actual operational base aircraft. The 155 passenger economy class aircraft (31,775 lb [14,413 kg] payload), cruise Mach at 0.80 at 31,000 ft (8,450 m) initial altitude, and an operational capability in 1985 was considered. Three propfan arrangements, wing mounted, conventional horizontal tail aft mounted, and aft fuselage pylon mounted are selected for comparison with the DC-9 Super 80 P&WA JT8D-209 turbofan powered aircraft. The configuration feasibility, aerodynamics, propulsion, structural loads, structural dynamics, sonic fatigue, acoustics, weight maintainability, performance, rough order of magnitude economics, and airline coordination are examined. The effects of alternate cruise Mach number, mission stage lengths, and propfan design characteristics are considered. Recommendations for further study, ground testing, and flight testing are included. Author

SLOTTED VARIABLE CAMBER FLAP Patent Application
Dana G. Andrews, inventor (to NASA) (Boeing Commercial Airplane Co., Seattle) Filed 30 Oct. 1981 13 p Sponsored by NASA
(NASA-Case-LAR-12541-1; US-Patent-Appl-SN-315588) Avail: NTIS HC A02/MF A01 CSCL 01C

Variable camber actuator assemblies broaden the range of speeds at which lift to drag performance is maximized for slotted flap wings. Lift is improved by varying wing camber with rotational flap movements that do not introduce wing slots and induced drag. Forward flaps are secured to forward flange links which extend from, and are a part of, forward flap linkage assemblies. The forward flaps rotate about flap pivots with their rotational displacement controlled by variable camber actuator assemblies located between the forward flaps and the forward flange links. Rear flaps are held relative to the forward flaps by rear flap linkage assemblies which may act independently from the forward flap linkage assemblies and the variable camber actuator assemblies. Wing camber is varied by rotating the flaps with the variable camber actuator assemblies while the flaps are in a deployed or tucked position. Rotating flaps in a tucked position does not introduce significant wing surface discontinuities, and reduces aircraft fuel consumption on most flight profiles. NASA

DYNAMICS OF AIRCRAFT ANTISKID BRAKING SYSTEMS
John A. Tanner, Sandy M. Stubbs, Robert C. Dreher, and Eunice G. Smith Feb. 1982 100 p refs
(NASA-TP-1959; L-14788) Avail: NTIS HC A05/MF A01 CSCL 01C

A computer study was performed to assess the accuracy of three brake pressure-torque mathematical models. The investigation utilized one main gear wheel, brake, and tire assembly of a McDonnell Douglas DC-9 series 10 airplane. The investigation indicates that the performance of aircraft antiskid braking systems is strongly influenced by tire characteristics, dynamic response of the antiskid control valve, and pressure-torque response of the brake. The computer study employed an average torque error criterion to assess the accuracy of the models. The results indicate that a variable nonlinear spring with hysteresis memory function models the pressure-torque response of the brake more accurately than currently used models. T.M.

REVIEW OF DEFENSE-RELATED VERTICAL AND SHORT TAKEOFF AND LANDING (V/STOL) AIRCRAFT PROGRAMS
Walter Z. Collings Washington GPO 1979 206 p refs Presented to the Comm. on Armed Serv., 96th Congr., 1st Sess., Sep. 1978 Prepared by AIAA, New York
(GPO-55-278) Avail: Committee on Armed Services

A technology review of bases supporting the development of Vertical of Short Takeoff and Landing (V/STOL) aircraft is presented. Representative aircraft were summarized according to their type of lift generation mechanisms. Successes, failures, problems encountered in development, and plans for the future are also presented. Some discussion of the Navy's envisionment/commitment to V/STOL aircraft is also presented. M.D.K.

XFV-12A DIAGNOSTIC AND DEVELOPMENT PROGRAMS Summary Report, Jan. 1979 - May 1981
P. M. Bevilaqua and C. P. Combs Nov. 1981 367 p refs
(Contract N00019-73-C-0053)
(AD-A108354; NR81H-50) Avail: NTIS HC A16/MF A01 CSCL 01/3

Activity during the XFV-12A thrust augmenter development program conducted from May 1979 to June 1981 is reported and documented. Diagnostic tests indicated a major source of performance deficiency could be attributed to feed duct/augmenter component interface problems rather than basic augmenter configuration. Interface problems seriously affected both isolated performance and flow quality of the primary augmenter nozzles resulting in significantly low levels of augmentation. A remedial program, the subject of this report, was initiated. The primary objective of this program was to systematically improve the performance of the XFV-12A aircraft's thrust augmenter lift systems. Major emphasis was placed not only on correcting flow deficiencies but also identifying and incorporating improvements in the augmenter design which would increase its performance potential. GRA

POTENTIAL REDUCTIONS IN AIRCRAFT OPERATION AND MAINTENANCE COSTS BY USING THRUST COMPUTING SUPPORT EQUIPMENT Report to the Honorable Joseph P. Addabbo, Chairman, Subcommittee on Defense, Committee on Appropriations, House of Representatives
27 Oct. 1981 17 p
(AD-A108463; GAO/PLRD-82-4) Avail: NTIS HC A02/MF A01 CSCL 01/2

This report addresses the evaluation of thrust measuring equipment. We interviewed Air Force officials and contractor representatives, reviewed documentation pertaining to the key events in the evaluation of the thrust computing system program, reviewed test data and analyses by Air Force and contractor engineers, and observed the operation of the thrust computing system. Our analyses show that the accurate measurement and setting of thrust for installed jet engines is of vital importance not only for aircraft readiness and safety but also for operation and maintenance cost reductions. Although test results indicate

that a system is available that can perform such measurements, the services have not been using it. The Air Force has conducted extensive tests that will measure thrust for installed J85-5 engines, but has not implemented a system. The Navy has not performed any tests to determine whether its aircraft jet engines might benefit from such a system.

C-5A AUSTERE AIRFIELD OPERATIONAL UTILITY EVALUATION. PHASE 2: OPERATION ON UNPAVED SOIL SURFACES FOLLOWING RAINFALL Final Report
Waldemar O. Breuhaus Oct. 1981 46 p refs
(Contract MDA903-79-C-0018)
(AD-A108597; AD-E500466; IDA-P-A1621; IDA/HQ-81-23896) Avail: NTIS HC A03/MF A01 CSCL 01/3

During the summer of 1980 and the winter of 1980-1981, an Operational Utility Evaluation (OUE) was conducted to determine operating characteristics of the C-5A airplane when taxiing or being towed and off-loaded on unpaved soil surfaces and on snow-covered surfaces. Subsequent to the successful completion of those tests, questions arose concerning the effects of rainfall that wets otherwise adequate bare soil areas to a significant depth. Tests with simulated rainfall of various amounts applied by agricultural sprinkler systems were conducted at March AFB, California, during July 1981. The airplane performed well, though it approached its performance limits in the most severe test conditions. Difficulties were encountered in arriving at a sprinkler system configuration reasonably approximating naturally occurring rainfall, and in arriving at a single simple descriptor to properly characterize the strength of soil in such a complex situation.

VIBRATION LEVELS IN ARMY HELICOPTERS: MEASUREMENT RECOMMENDATIONS AND DATA Final Report
John C. Johnson and David B. Priser Sep. 1981 35 p refs
(DA Proj. 3E1-6277-A-878)
(AD-A108131; USAARL-81-5) Avail: NTIS HC A03/MF A01 CSCL 01/3

Surveys on vibration levels found in currently fielded helicopters were used to prepare a comparative summary of vibration exposure levels at crew stations and of the test methods used to measure these levels. This effort was initiated at the request of the Air Standardization Coordinating Committee (ASCC) Working Party 61 and because of the wide variety of methods used in data capture and instrumentation documentation. Sources of the literature reviewed included technical reports of U.S. Government agencies and papers in open literature. Articles were reviewed based upon three criteria: (1) quantitative description of vibration in currently fielded U.S. Army rotary winged aircraft, (2) article contents are unclassified and available for publication in open literature, (3) article describes human exposure levels of aircraft vibration.

The use of carbon fiber reinforced plastics as a substitute for light weight metals in aircraft construction, which decreases the weight by 30%, is discussed. Environmental parameters, like temperature and humidity must be considered. A construction method with a variety of possibilities to fulfill these requirements and which competes with metal structures is developed. This means either a simplified weight reduction at the same or less cost, or a less costly method for the same or less weight.

TENDENCIES IN THE DEVELOPMENT OF SUBSONIC TRANSPORT AIRCRAFT WITH SPECIAL CONSIDERATION OF AERODYNAMICS
Horst Koerner Oct. 1981 42 p refs Transl. into ENGLISH of "Entwicklungstendenzen bei Unterschall-Transportflugzeugen unter besonderer Beruecksichtigung der Aerodynamik", Rept. DFVLR-Mitt-80-15 Brunswick, Jun. 1981 62 p
(ESA-TT-706; DFVLR-Mitt-80-15) Avail: NTIS HC A03/MF A01

Tendencies in subsonic transport aircraft development, specifically due to progress in aerodynamics, are surveyed. Prospective wing profile designs and improved integration of body dimensions are considered, citing examples from the AIRBUS development program. Possible fuel savings through supercritical wing technology and by optimizing reduction in friction drag are also studied. Advantages to be gained by active control, particularly from adaptive wing technology, are reviewed. As a potential application, an unconventional canard configuration, including transonic propellers, for an aircraft in the AIRBUS class is proposed.
Author (ESA)

N82-18215 Royal Aircraft Establishment, Farnborough (England).

A recent method of correcting for errors due to blockage, applicable to complex shapes and high blockage ratios, was applied to the Aeronautical Engineering Department industrial wind tunnel. A tunnel centerline, source-sink distribution was derived from measured wall pressure signatures. The interference effect of the tunnel walls was calculated; blockage corrections were applied to in-tunnel measurements of forces and pressures. The drag coefficient of a normal flat plate of deliberately high blockage ratio (12%) was measured in the tunnel, then corrected to the value in unconfined flow. This is found to be close to the expected value and indicates that the pressure signature method can be reliably used to correct measurements obtained from models, up to this value of blockage. The effective body implied by the equivalent potential flow was also calculated. This compares well with the known effective body shapes of flat normal plates in confined flow. Author (ESA)

The application of the superplastic forming/diffusion bonding (SPF/DB) process to supersonic cruise research is investigated. The capability of an SPF/DB titanium structure to meet the structural requirements of the inner wing area of the NASA arrow-wing advanced supersonic transport design is evaluated. Selection of structural concepts and their optimization for minimum weight, SPF/DB process optimization, fabrication of representative specimens, and specimen testing and evaluation are described. The structural area used includes both upper and lower wing panels, where the upper wing panel is used for static compression strength evaluation and the lower panel, in tension, is used for fracture mechanics evaluations. The individual test specimens, cut from six large panels, consist of 39 static specimens, 10 fracture mechanics specimens, and one each full size panel for compression stability and fracture mechanics testing. Tests are performed at temperatures of -54 C (-65 F), room temperature, and 260 C (500 F). B.W.

FOUNDATIONS FOR COMPUTER SIMULATION OF A LOW PRESSURE OIL FLOODED SINGLE SCREW AIR COMPRESSOR M.S. Thesis - Purdue Univ.
Thomas W. Bein Dec. 1981 122 p refs
(AD-A108230; DTNSRDC/PAS-81/24) Avail: NTIS
HC A06/MF A01 CSCL 13/7

The necessary logic to construct a computer model to predict the performance of an oil flooded, single screw air compressor is developed. The geometric variables and relationships used to describe the general single screw mechanism are developed. The governing equations to describe the processes are developed from their primary relationships. The assumptions used in the development are also defined and justified. The computer model predicts the internal pressure, temperature, and flowrates through the leakage paths throughout the compression cycle of the single screw compressor. The model uses empirical external values as the basis for the internal predictions. The computer values are compared to the empirical values, and conclusions are drawn based on the results. Recommendations are made for future efforts to improve the computer model and to verify some of the conclusions that are drawn. Author (GRA)

ACOUSTIC FATIGUE ENDURANCE TEST OF USB FLAP STRUCTURE MODELS AT ELEVATED TEMPERATURE
Masaaki Sano, Yoshinori Fukimori, Soushiro Iida, Keiji Komatsu, and Koichi Egawa Oct. 1981 59 p refs In JAPANESE; ENGLISH summary
(NAL-TR-683) Avail: NTIS HC A04/MF A01

Five substructural models of upper surface blown flaps were tested to verify the safety of the flap structure during a planned flight evaluation of the NAL-STOL experimental aircraft. All models consisted of the face panel with stringers and ribs rivetted on the backside in shape. Four panels were flat; one had the same curvature as the actual flap structure. Three face panels and stiffeners were of Ti-6Al-4V' the others were of 2024C-T3 alloy. Results of thermal buckling tests, resonant frequencies of all panels, the dynamic and the measurement of dynamic strain response are discussed. All structural models proved strong enough to resist both acoustic and thermal loading. No detectable damage was found on the panel face nor around the rivet holes. Estimated lives based on simulated and experimental strain histories suggest confirmation of the fatigue test results. A.R.H.

STRUCTURAL SYSTEM IDENTIFICATION TECHNOLOGY VERIFICATION Final Report
N. Giansante, A. Berman, W. G. Flannelly, and E. J. Nagy Ft. Eustis, Va. Army Research and Technology Labs. Nov. 1981 218 p refs
(Contract DAAK51-78-C-0017; DA Proj. 1L1-62209-AH-76) (AD-A109181; R-1631; USAAVRADCOM-TR-81-D-28) Avail: NTIS HC A10/MF A01 CSCL 13/13

Structural system identification is the method of obtaining structural and dynamic mathematical models and improving existing mathematical models using ground vibration test data. The purpose of the subject program was to perform experimental, development, and research work to verify the concepts of structural system identification technology. To accomplish this, system identification techniques were applied to a U. S. Army AH-1G helicopter fuselage to create a mathematical model from ground vibration test data, to improve a reduced model of an existing NASTRAN model of the AH-1G using shake test data, and to test the effectiveness of these new mathematical models in predicting the effects of stiffness and mass changes to the airframe. The results of the program indicate that system identification is a viable and cost-effective technique for developing new models and for improving existing finite-element models of an airframe using ground vibration test data. FRACTURE AND FATIGUE CHARACTERIZATION OF AIRCRAFT STRUCTURAL MATERIALS UNDER BIAXIAL LOADING Final Scientific Report, 1 Oct. 1976 - 30 May 1980
D. L. Jones and J. Eftis Dec. 1981 204 p refs
(Grant AF-AFOSR-3096-76; AF Proj. 2307)
(AD-A109054; AFOSR-81-0856TR) Avail: NTIS HC A10/MF A01 CSCL 01/3

A general fracture mechanics analysis was performed to examine the influence of biaxial applied loads on the mechanical state of the body. The geometries examined were the single crack and two coplanar cracks with an arbitrary orientation and the cracked shear panel. It was found that the biaxial loads influenced all aspects of the mechanical state of the body, with the exception of the stress intensity factor for a crack oriented parallel to the biaxial load. The extent and nature of the biaxial effect on the crack-tip stress field, stress intensity factor, angle of initial crack extension, crack-tip displacements, elastic strain energy, fracture load and fatigue crack growth rates are all discussed. A biaxial test facility was developed and a considerable number of photoelastic, fracture toughness, and fatigue crack growth rate experiments were performed. Confirmation of the analytical predictions was obtained for the biaxial effects on the crack-tip stress field, the angle of initial crack extension, the fracture load, and the fatigue crack growth rates. The biaxial loads were seen to influence all of these parameters in varying degrees. GRA

EFFECTS OF REPETITION RATE AND IMPULSIVENESS OF SIMULATED HELICOPTER ROTOR NOISE ON ANNOYANCE
Clemans A. Powell and David A. McCurdy Feb. 1982 59 p refs
(NASA-TP-1969; L-14836) Avail: NTIS HC A04/MF A01 CSCL 20A

Annoyance judgements were obtained for computer generated stimuli simulative of helicopter impulsive rotor noise to investigate effects of repetition rate and impulsiveness. Each of the 82 different stimuli was judged at 3 sound pressure levels by 48 subjects. Impulse repetition rates covered a range from 10 Hz to 115 Hz; crest factors covered a range from 3.2 dB to 19.3 dB. Increases in annoyance with increases in repetition rate were found which were not predicted by common loudness or annoyance metrics and which were independent of noise level. The ability to predict effects of impulsiveness varied between the noise metrics and was found to be dependent on noise level. The ability to predict the effects of impulsiveness was not generally improved by any of several proposed impulsiveness corrections. Instead, the effects of impulsiveness were found to be systematically related to the frequency content of the stimuli. A modified frequency weighting was developed which offers improved annoyance prediction. Author

EFFECT OF FACILITY VARIATION ON THE ACOUSTIC CHARACTERISTICS OF THREE SINGLE STREAM NOZZLES

Orlando A. Gutierrez 1980 38 p refs Presented at the 100th Meeting of the Acoust. Soc. of Am., Los Angeles, 17-21 Nov. 1980
(NASA-TM-81635; E-646) Avail: NTIS HC A03/MF A01 CSCL 20A

The characteristics of the jet noise produced by three single stream nozzles were investigated statistically at the NASA-Lewis Research Center outdoor jet acoustic facility. The nozzles consisted of a 7.6 cm diameter convergent conical, a 10.2 cm diameter convergent conical and an 8-lobe daisy nozzle with 7.6 cm equivalent diameter flow area. The same nozzles were tested previously at cold flow conditions in other facilities such as the Royal Aircraft Establishment (RAE) 7.3 m acoustic wind tunnel. The acoustic experiments at NASA covered pressure ratios from 1.4 to 2.5 at total temperatures of 811 K and ambient. The data obtained with four different microphone arrays are compared. The results are also compared with data taken at the RAE facility and with a NASA prediction procedure. Author

AERODYNAMIC NOISE GENERATED BY JET WING/FLAP INTERACTIONS OF THE EXTERNAL USB CONFIGURATION OF STOL AIRCRAFT. PART 2: FULL SCALE MODEL EXPERIMENT USING FJR710 TURBOFAN ENGINE

Masataka Maita, Shigemi Shindo, Shin Nakayama, Masakatsu Matsuki, Tadao Torisaki, Mitsuo Morita, Akira Yoshida, Katsumi Takeda, Shizuo Sekine, and Hiroshi Kondo Oct. 1981 26 p refs
(NAL-TR-687T-Pt-2; ISSN-0389-4010) Avail: NTIS HC A03/MF A01

Acoustic characteristics of the external upper surface blowing (USB) concept of a propulsive lift configuration were studied by full scale model static experiments. Test components included an FJR710 turbofan engine with an acoustically treated nacelle and a USB wing/flap assembly. These were utilized in conjunction with the ground verification testing of the propulsive systems of the National Aerospace Laboratory Quiet STOL Research Aircraft. Results were compared with the previous 8% scale cold flow model data. The defect of shielding provided by the wing/flap surface on aftradiated turbofan engine noise was studied and some attempts were made to reduce USB noise. Author

AIRCRAFT NOISE PREDICTION PROGRAM THEORETICAL MANUAL, PART 2

William E. Zorumski Feb. 1982 296 p refs 2 Vol.
(NASA-TM-83199-Pt-2; L-14805-Pt-2) Avail: NTIS HC A13/MF A01 CSCL 20A

Detailed prediction methods for specific aircraft noise sources are given. These sources are airframe noise, combustion noise, fan noise, single and dual stream jet noise, and turbine noise. Modifications to the NASA methods which comply with the International Civil Aviation Organization standard method for aircraft noise prediction are given. R.J.F.

N82-19952# Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio.

ACOUSTIC MEASUREMENTS OF F100-PW-100 ENGINE OPERATING IN HUSH HOUSE NSN 4920-02-070-2721 Final Report, May - Sep. 1981

Vincent R. Miller, G. A. Plzak, and J. M. Chinn Sep. 1981 58 p refs
(AD-A108814; AFWAL-TM-81-133-FIBE) Avail: NTIS HC A04/MF A01 CSCL 20/1

The purpose of this test program was to measure the acoustic environment in the hush house facility located at Kelly AFB Texas during operation of the F100-PW-100 engine to ensure that engine structural acoustic design limits were not exceeded. The acoustic measurements showed that no sonic fatigue problems are anticipated with the F100-PW-100 engine structure during operation in the hush house. The measured acoustic levels were less than those measured in an existing F100-PW-100 engine wet-cooled noise suppressor, but were increased over that measured during operation on an open test stand. It was recommended that the acoustic load increases measured in this program should be specified in the structural design criteria for engines which will be subjected to hush house operation or defining requirements for associated equipment. AN EXPERIMENTAL STUDY OF THE EFFECTS OF AN INLET FLOW CONDITIONER ON THE NOISE OF A LOW SPEED AXIAL FLOW FAN

J. Scoles and J. B. Ollerhead Jan. 1981 92 p refs
(Contract AT/2170/049/XR)
(TT-8101) Avail: NTIS HC A05/MF A01

The effects of inflow condition on the noise generated by a 40kW, 560mm diameter, seven blade ducted fan at speeds up to 5000rpm in an anechoic chamber were measured. A 1.25m diameter hemisperical honeycomb flow conditioner (HFC) which could be fitted with an internal gauze liner was used. Fan entry flow was measured by static and rotating hot-wire anemometers. Noise levels in the first few harmonics of blade passing frequency are very sensitive to inflow condition, but the HFC reduces them to a residual level independent of upstream disturbance levels. Broadband noise is reduced (by a smaller amount) at high blade angles and flow rates. No systematic effect of the gauze liner is detected. Experimental difficulties are caused by unsteadiness in the chamber airflow which causes harmonic level fluctuations with amplitudes of up to 10dB. Although the inlet flow conditioner reduces these fluctuations markedly, long term variations reduce confidence in the data. Author (ESA)

NOISE MEASUREMENTS ON THE HELICOPTER BK 117 DESIGN. WEIGHTED NOISE LEVELS AND INFLUENCE OF AIRSPEED

Wolf R. Splettstoesser, Klaus P. Anders, and Karl-Heinz Spiegel Aug. 1981 93 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-748)
(DFVLR-Mitt-81-18) Avail: NTIS HC A05/MF A01; DFVLR, Cologne DM 22,95

Noise measurements on the prototype helicopter BK 117 were performed in strict compliance with the proposed International Civil Aviation Organization regulations for noise certification of helicopters. Measurement procedure, noise data acquisition, analysis and reduction as well as applied correction procedures arc described. Effective perceived noise levels (EPNL) and other noise descriptors were evaluated and related to the proposed noise limits. Additional level flyover tests with variable airspeed were conducted to investigate the resulting effect on the EPNL and other noise measures. Author (ESA)

COLLECTION AND EVALUATION OF PROPELLER AIRCRAFT NOISE CERTIFICATION DATA

Manfred Ahlswede and Klaus Peter Anders Aug. 1981 87 p refs In GERMAN; ENGLISH summary
(DFVLR-Mitt-81-20) Avail: NTIS HC A05/MF A01; DFVLR, Cologne DM 25,20

More than 300 individual noise certification levels were measured for propeller driven airplanes up to 5700 kg takeoff weight and for powered gliders in accordance with the rules and regulations as set forth in International Civil Aviation Organization Annex 16. Information on the airplanes, the engines and the propellers is provided as well as on the prevailing meteorological parameters and the operational parameters together with acoustic data. Of the latter, the measured

A-weighted levels with their 90% confidence limit are listed, the performance correction is given and the certification level as well as the noise-limit are provided. Data are evaluated by plotting the measured A-weighted levels versus the helical blade tip Mach number. Author (ESA)

GLOBAL POSITIONING SYSTEM TIMING RECEIVERS IN THE DSN

P. A. Clements *In its* The Telecommun. and Data Acquisition Rept. 15 Feb. 1982 p 90-99 refs

Avail: NTIS HC A07/MF A01 CSCL 17G

The system (GPS) is a worldwide navigation system using a constellation of Earth satellites with onboard clocks. The GPS is also usable to transfer time and frequency. Preliminary tests with the breadboard receiver at NBS produced precision in time and frequency transfer between the United States Naval Observatory (USNO) and NBS. JPL's plans to install receivers in the DSN to demonstrate their ability to transfer time and frequency within the DSN and between the DSN and outside agencies are discussed. T.M.
